IS progress general in Nova Scotia's famous fruit belt? This is the first question that naturally comes to one as he considers the subject—The general progress of the Annapolis Valley—which has been assigned to me for the special number of the "Farmer."

In a few departments of activity in the Annapolis Valley there is little progress, but in many others there is steady improvement while in everything in relation to the great apple growing industry the advance is phenominal. We can, therefore, safely assert that progress is general in the district in question.

Stock raising would be included in the list first mentioned. In this activity there has not been progress, but rather the reverse. The growing demands of the orchard, the scarcity of labor, the improvement in our horses and the competition of the prairie fed cattle of the West have pushed stock raising in the Annapolis Valley to the background.

Our country roads despite all efforts for their improvement seem to grow worse rather than better. Similarly our rural schools are scarcely keeping up to the increasing educational demands of the times.

But on the other hand there has been a remarkable improvement in butter making on the farms. Fifteen years ago it was hard to find good merchantable butter in private dairies. To-day it is unusual to find a poor article coming from an Annapolis Valley farm. The revival of silo building is giving a new impetus to this industry.

In our graded schools, academies and higher educational institutions, the work now being done is much better and more practical than that of 20 years ago. Permanent road building has been started in most of the Valley towns and it is to be hoped that soon the movement may spread into the surrounding districts.

Again take such public utilities as the telephone and the mail. Many of the farm houses enjoy the advantage of the telephone, there is scarcely a community which has not at least one instrumen t and Wolfville and Middleton have the all night service. In a few weeks several other Valley towns will enjoy the same convenience. Sewerage, light and gravity water systems are to be found in most of the towns and many of the farms at the foot of the North Mountain have private water systems.

A dozen years ago weekly, semi-weekly and tri-weekly mail service was the best that many places could boast, but there are few sections to-day that do not have a daily service and in perhaps a dozen of the best farming districts rural free delivery has been established.

In farm machinery the past two decades have brought much change for the better. In all the new modern barns which dot the Valley are found power forks. The rakes which formerly demanded the attention of a man can now be operated by the merest touch from the hand or foot of a boy. In place of the old spike tooth is now found the disc harrow. The sickle, scythe and the cradle have given place to the reaper and the hay tedder and the manure spreader are coming into general use.

Stone or wooden drains were the only ones used until the past half a dozen years. Now the clay tile is manufactured in the Valley and its use is increasing rapidly. As high as five miles of tile has been placed on a single farm in one year. The extension of drainage in the rich heavier soils promises a great increase of crop production for the future.

China after centuries of stagnation has surprised the world with a political revolution. An industrial revolution almost as complete as that of China is taking place in the apple raising business of the Annapolis Valley. It was not a great while ago that many of the growing orchards were left in sward and those that were tilled only received one plowing and harrowing in a season. Now the leading fruit growers after the Spring plowing keep the harrow going every few days till mid-summer in order to conserve the moisture. In July some nitrogen gathering cover crop is sown to be plowed under late in the Autumn, or in the early spring.

A decade ago many farmers of the Valley regarded spraying with scepticism, or if they sprayed they did more damage than benefit to the orchard. Through the influence of the farm journals, associational gatherings and institute work, spraying is being carried on intelligently and regularly. The fact that the Valley produced the cleanest crop of apples it has ever known, last season, was partially due to the weather conditions, but was probably also due in part to regular and intelligent spraying. The purchase of 150 power sprayers last year and the indications that as many will be ordered this year show how thoroughly convinced our horticulturists are of the importance of spraying.

Another inovation with the farmers of our fruit belt is the thinning of the apples in midsummer. This is regularly practised now by a few of our most progressive men. Although longer keepers our apples grew a little smaller than in some of the warmer fruit districts and in competition sometimes suffer in consequence. The practice of thinning by increasing the size of our fruit promises to be of particular benefit in maintaining the splendid reputation of our apples.

In the handling of our fruit there has also been a revolution. Fifteen years ago there was not a single fruit shipping warehouse in the Valley. To-day there are over 90 with a total capacity of nearly a million barrels. Formerly the fruit was packed on the farm and hauled to the cars as required. No matter what the condition of the roads or the weather, they must be hauled and it generally required a day or two to load a car. Now the fruit is hauled direct to the warehouse at the railway siding from the orchard when the roads and weather are good. At leisure they are packed under a uniform system. When a steamer is due at Halifax, special trains drop the cars at the various fruit houses. The apples are rolled in sometimes three and four cars loading at the same time from a single warehouse. Three or four hours after the cars are distributed special trains are picking them up again and five or six hours after the apples leave the fruit houses they are being swung into the hold of a steamer at Halifax.

No article dealing with the progress of the Annapolis Valley would be complete which omitted reference to the development of the co-operative movement. An attempt was made some 40 years ago to establish the co-operative method of doing business among the farmers of the Annapolis Valley. At that time in this district in common with other parts of Nova Scotia cheese factories were started to be operated upon the mutual basis. One after the other these closed up; the one at Williamston, Annapolis Co., however, survived for over 30 years.

Another attempt at co-operation was made among the farmers of the Valley 15 years ago. An effort was made to form a co-operative shipping company with capital stock of $50,000. The object was to build and operate warehouses and if necessary to charter steamers to carry the apples. The required capital was not raised and the scheme failed for the time being. The building of the first apple warehouse in the Valley which closely followed was probably a ditect result of this agitation.

About four years ago a local co-operative shipping company was formed among the farmers of Berwick. This was probably an outcome of the agitation in favor of co-operation some ten years before. Other local co-operative companies followed until now there are twenty-five and before the next apple crop is ready for har-

The Care of New Born Foals.

Extracts From a Circular of the University of Wisconsin Agricultural Experimental Station.

By A. S. Alexander, V. S.

THE horses of the Maritime Provinces are rapidly increasing in value. The importance of the horse breeding industry suggests the importance of saving the greatest possible number of the foals born each year. At present a large per centage of the annual foal crop is lost. Most of this mortality might be prevented by treating the mare intelligently and giving proper attention to the navel and bowels of the new born foal. It is the purpose of this article to furnish practical instruction on these matters for the guidance of those having the charge of brood mares and foals.

CAUSE OF NAVEL AND JOINT DISEASES.

The navel cord (umbilicus) connects the foal's body with the afterbirth (placental membranes) of the mare. It is made up of gelatinous tissue covering a large vein coming from the foal's liver and carrying impure blood to be purified in the lungs of the mare; two arteries carrying pure blood from the arteries of the mare, by way of the placenta, to the arteries of the foal, and a tube (urachus) from the foal's bladder which, while the colt is in the womb, discharges urine into one of the envelopes (allantois) covering the foal.

When the navel cord breaks at birth its blood vessels and tube promptly close, if all goes well. If pus-forming germs from filthy or soiled bedding, floor, or ground, get onto the raw navel cord, however, they cause infection, inflammation and collections of pus at the point involved and thence germs are carried into the system and form colonies (secondary abscesses) elsewhere in the body and notably in the joints of the extremities.

In cases of generalized infection (pyaemia) abscesses may be found in the liver, kidneys, lungs, brain, muscles and subcutaneous connective tissue. If the urachus fails to close, urine dribbles or streams from the navel opening and, in that event, abscesses of the joints eventually appear, the infection having become general. The latter condition is termed "pervious" or "persistent" urachus. A majority of infected foals die. Recovery is seldom perfect. The colts fail to thrive, or develop perfectly and are apt to have chronic affections of the joints. Treatment of the disease can only be properly conducted by the trained veterinarian and he may employ a special (anti-streptococcic) serum with some degree of success, both as a preventive and curative agent.

Seventy-five per cent. of the cases of this disease affect foals during the first three weeks of life. Fat, flabby foals, with extra large navel cords, often the get of overfed, pampered, under-exercised stallions, or from mares in like condition—are especially prone to the disease and are most likely to succumb. Foals that have small navel cords and are lively at birth, soon on their feet and nursing, are much less liable to attack.

Stallions should be worked, or abundantly exercised, and so fed and maintained as to insure virility, vigor, stamina, robust constitution and the perfect health of every organ. Mares should be similarly treated. Foals will then be likely to come into the world healthy, lively and strong to resist disease.

SYMPTOMS OF NAVEL AND JOINT DISEASE.

A few days after birth the foal is found to be weak, lame, feverish and with impaired appetite. One joint, or another, is swollen, hot and painful. Usually the attack affects the fetlock, hock, stifle, hip, knee. elbow or shoulder. Sometimes abscesses form at the poll, about the ribs, or along the spinal column. The swellings rapidly increase in size and several joints are affected at one time. There is swelling of the navel, and pus oozes from one or more openings. Pus forms in quantities in the affected joints. Diarrhoea usually comes on, or may be alternated with constipation. Soon the foal is too weak to stand, loses appetite entirely, and dies in a few days, or in two or three weeks, in lingering cases. Often urine escapes from the navel, or the foal passes bloody urine; but the latter symptoms may, for a time at least, be present without noticeable symptoms of pus infection.

MANAGEMENT OF THE PREGNANT MARE.

The mare in foal should be worked lightly or abundantly exercised every day. Exercise is absolutely necessary. She should occupy a roomy box stall. Here she will take some additional exercise and will not be afraid to lie down. She will be less likely to become "cast" and escape having "stocked" legs and dropsical swellings of the udder and abdomen. The bedding should be kept clean and dry.

Feed the mare sound, whole oats, bran and mixed or timothy hay. Avoid moldy hay or silage, damaged grain, woody, weathered fodder, dusty or rusty straw, or hay containing ergot. Keep pregnant mares out of corn stalk fields. Provide them with plenty of pure, clean water. In working mares avoid jerking, severe pulling, wading through deep mud, manure piles or snow drifts. Let the work be light, easy and steady. Keep the bowels active by feeding bran and a little flaxseed meal, carrots, or some sweet silage.

The mare goes 48 weeks, or about 340 days with foal. As foaling time approaches decrease the grain ration and increase laxative foods to keep the bowels acting freely. Constipation is dangerous. When wax forms on the teats, about three days before foaling, stop working the mare and place her in a prepared box stall where she can be watched until the foal is born.

After foaling leave the mare alone for a time, if she is lying down. If she does not expel her afterbirth promptly when she rises from resting, inject into her womb one half gallon of luke-warm 1 per cent. solution of coal tar disinfectant, or other mild antiseptic. If the afterbirth then does not come away within an hour or two, it should be removed by hand. An expert should be employed for this operation and when it has been performed the womb should again be flushed out with an antiseptic solution. Half an hour after the birth of the foal, or about that time, offer the mare a pailful of luke-warm water and again at intervals of two hours. Mares are thirsty at this time and should be abundantly supplied with water. An hour after foaling the mare may eat a mash of steamed oats, and bran, if she has been accustomed to such feed; otherwise give her a small feed of her ordinary grain ration. In a few days, if the weather is fine, the mare and foal may take some out door exercise and in two weeks, or thereabouts, she should have recovered from foaling and be taking her usual feed, grazing grass and getting ready to resume light work in harness.

THE FOALING BOX-STALL.

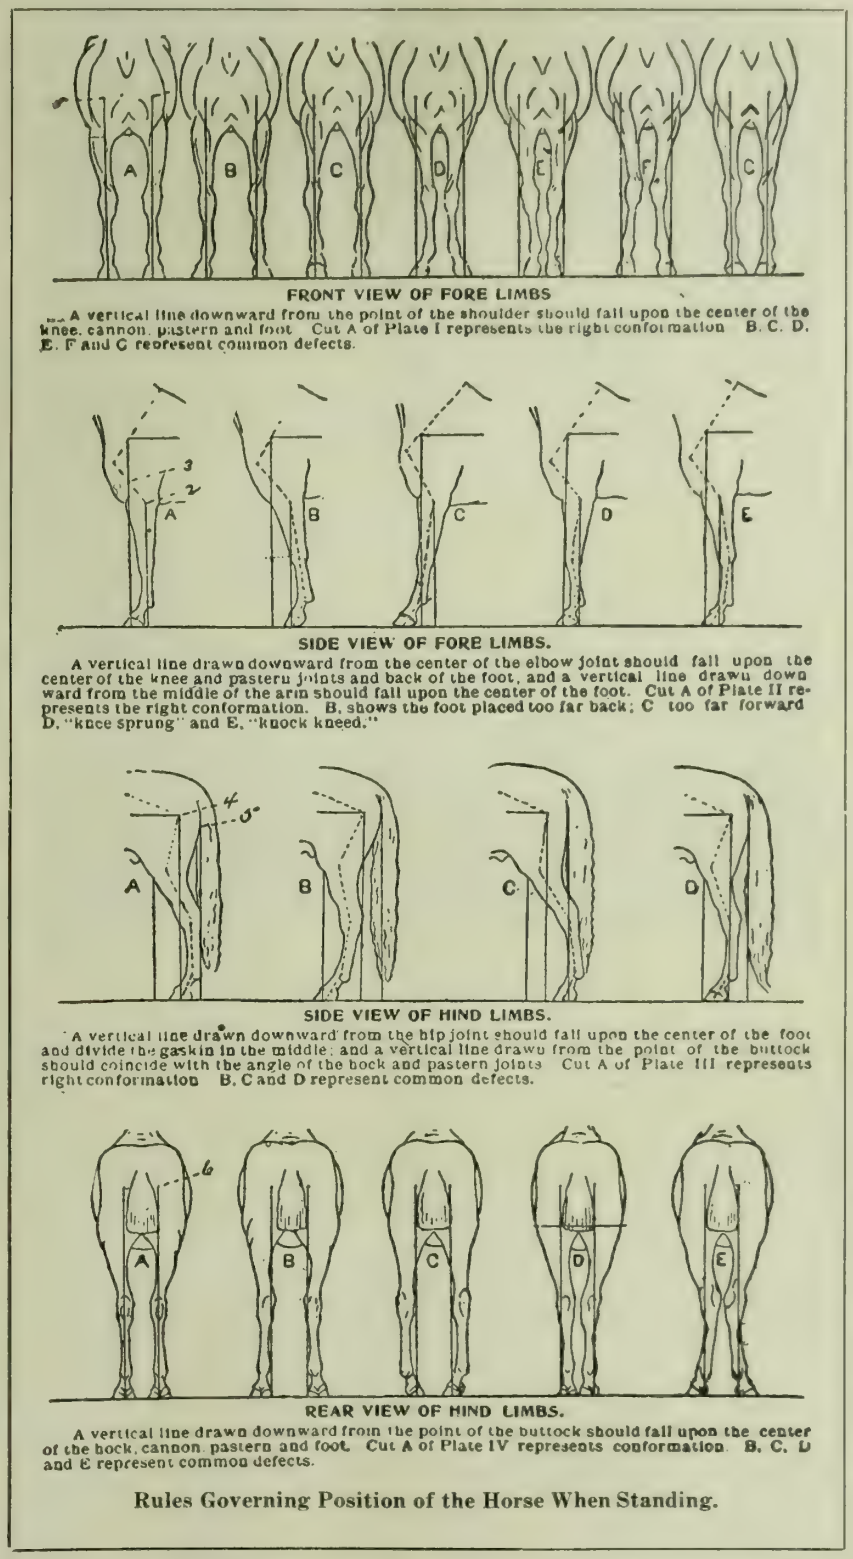
Two 14 by 14 foot box stalls should be kept ready for the use ofmares on every farm where foals are raised. No mare should be allowed to foal in an ordinary stall, or unprepared box stall. Navel and joint diseases will not be likely to attack foals born in clean places. An absolute clean foaling place is necessary and should be prepared as follows:

Remove and burn all loose litter, and manure. Cleanse and scrape the floor; then saturate it with a hot 1-50 solution of coal tar disinfectant, or a solution of 4 ounces of sulphate of copper (bluestone) to one gallon of hot water. Scrub and cleanse the walls with a similar solution of coal tar disinfectant; or a 1-1000 solution of corrosive sublimate. Cleanse the ceiling in the same way; then apply to walls and ceiling fresh made lime white wash, to each gallon of which has been added one-third of a pound of chloride of lime. Cover the floor with fresh, dry planing mill shavings in preference to any other bedding material. Remove manure as soon as dropped.

When the foal is born and has been cared for and the afterbirth of the mare has come away, remove the mare and foal to the second box stall, prepared as was the first. Then clean out, disinfect and whitewash the stall just used and put in fresh, clean dry shavings in readiness for the reception of the next mare. The mare must always occupy a clean, specially prepared box-stall and it should be perfectly ventilated and as sunny as possible.

Where but one box-stall is available clean it out, burn the afterbirth and soiled bedding, use a disinfecting solution freely on the floor and put in plenty of fresh, dry, clean shavings as soon as possible after the birth of the foal. If the mare foals on grass treat the foal as if it had been born

(Continued on page 494).



FRONT VIEW OF FORE LIMBS

A vertical line downward from the point of the shoulder should fall upon the center of the knee, cannon, pastern and foot. Cut A of Plate I represents the right conformation. B, C, D, E, F and G represent common defects.

SIDE VIEW OF FORE LIMBS.

A vertical line drawn downward from the center of the elbow joint should fall upon the center of the knee and pastern joints and back of the foot, and a vertical line drawn downward from the middle of the arm should fall upon the center of the foot. Cut A of Plate II represents the right conformation. B, shows the foot placed too far back; C too far forward D, "knee sprung" and E, "knock kneed."

SIDE VIEW OF HIND LIMBS.

A vertical line drawn downward from the hip joint should fall upon the center of the foot and divide the gaskin in the middle; and a vertical line drawn from the point of the buttock should coincide with the angle of the hock and pastern joints. Cut A of Plate III represents right conformation. B, C and D represent common defects.

REAR VIEW OF HIND LIMBS.

A vertical line drawn downward from the point of the buttock should fall upon the center of the hock, cannon, pastern and foot. Cut A of Plate IV represents conformation. B, C, D and E represent common defects.

Rules Governing Position of the Horse When Standing.

Soiling Crops in Relation to Dairying.

An Address Delivered Before the Farmer's and Dairymen's Convention Held Recently at Fredericton.

By G. H. Cutler, Lecturer in Cereal Husbandry At Macdonald College.

I am deeply sensible of the honor which this Association has conferred upon me in again asking me to assist at this time. And it was with much pleasure that I accepted your invitation, not because you wished me to serve in this capacity, but as one coming from Macdonald College I regarded it as a special opportunity to become acquainted with the farmers of New Brunswick whose sons and daughters come to our halls. For at this convention one meets representatives from all parts of the province.

The subject which I shall discuss is one of much moment to people whose climate resembles yours of New Brunswick or ours of Quebec. Despite your many natural advantages for Dairying, an unequal distribution of rainfall coupled with periodic spells of intense heat make it that the pastures do not maintain their abundance or juiciness throughout the growing season. Moreover an almost annual visitation of dry weather of varying degrees and duration is to be reckoned with—which parches the pastures to a point of uselessness. This condition combined with tne heat and nuisances of flies inevitably cause a reduction in the milk flow and simaltaneously an appreciable decline in the cow's flesh. It is to meet this distressing state of affairs that I wish to emphasize the soiling crop—a crop which can be used as green feed in the stall.

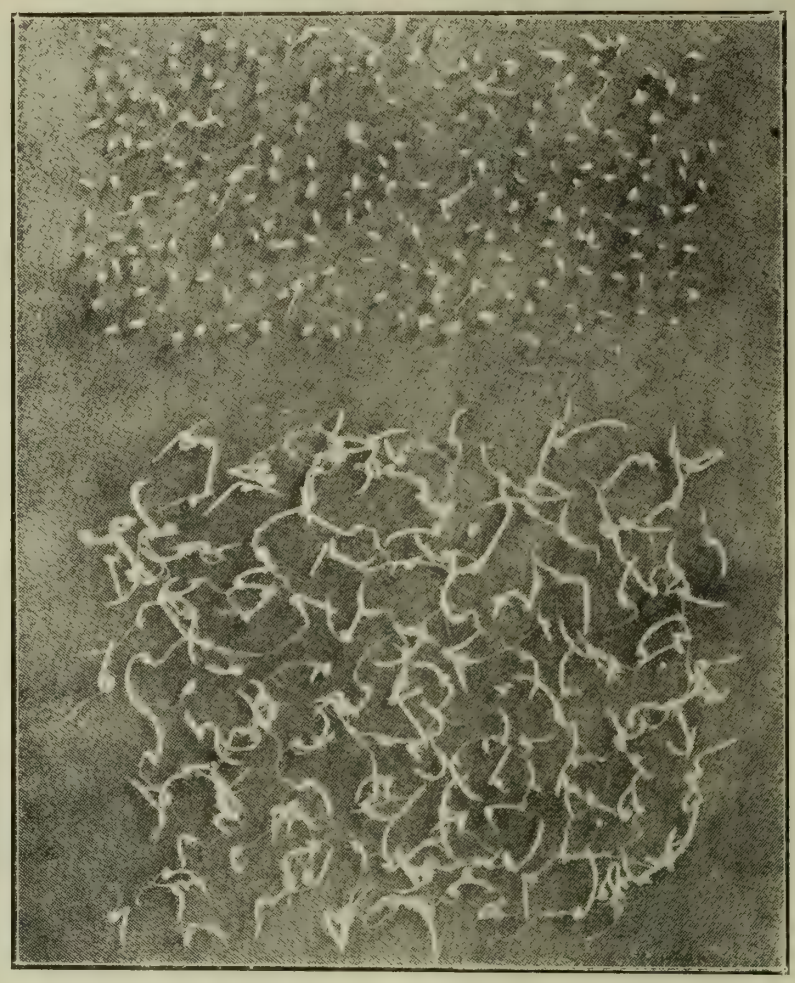
For a number of years in the Province of Quebec the summer silo has been employed with varying success. This system has its ardent supporters since it possesses many commendable features. The systematic adoption of soiling crops on the other hand has never met with any degree of permanence in spite of the advantages accruing. In fact it cannot be said that either system neither separately or in combination has been accepted in a way commensurate with the importance each merits. An extra expenditure of labour has always been offered as an objection to either system. But if one is desirous of supplying the milch cow with food closely approximating the June pasture, he must use green feed as a supplement. For feed of this nature in season and out, summer and winter, becomes absolutely essential to greatest efficiency. The soiling crop serves to economically maintain the milk flow and what is quite as important the cow is kept in much better heart for the approaching winter work.

The need for the provision of green feeds for summer feeding is therefore fully apparent. For proof of the feasibility of some system of soiling we have only to turn to the Danes and Dutch, our greatest rivals in Dairying. These people have thus increased not only the individual output of the cow and herd but they have actually increased the fertility of their farms—thereby their cattle holding capacity. To-day they are aspiring to maintain one cow per acre, while we consider one cow per five acres quite an accomplishment.

Before deciding upon what we shall use by way of crops for soiling let us get clearly in mind a few essentials the observance of which is quite necessary for most satisfactory returns. Because while one crop may supply one essential it may be lacking in another and thus less profitable. The aim should be to use that crop which combines as nearly as it is possible all the good qualities sought. Then and then only is one enabled to produce the maximum amount of feed at a minimum of outlay and with the greatest measure of satisfaction.

The essentials to be borne in mind are briefly these:—

1.—Palatability, 2.—Nutrition, 3.—Succulency, 4.—Bulk and Yield, 5.—Adaptability.



Two samples of Timothy Seed under germination test three days. The upper sample shows weak vital energy, while with the lower one it is strong.

These qualities are not always available in any one crop but may be procured in a mixture where two or more crops are combined. From the standpoint of production and quality of feed a combination of certain crops is economical. At Macdonald College we have been testing numerous crops singly and in combination in varying proportions to ascertain the best combinations for soiling purposes. I shall therefore base my discussion of the crops themselves upon our own investigations. The crops under test are, Oats, Peas, Winter Rye, Hairy and Common Vetch, Alfalfa, Corn, Rape, Mangels, Fall Turnips and Millets.

In selecting an Oat for this purpose, choose a heavy strawed leafy one such as Early Gothland or Early Blossom. By so doing one not only gets greater yields but greater succulency and palatability. In the Peas the same type character should be kept in mind. Where combination is attempted the ingredients should reach the same stage of maturity at about the same period. The Prussian Blue or Golden Vine pea gives very good results with the Early Gothland Oat. In fact when seeded at the rate of 2 bus. of oats to 1½ bus. peas per acre these two crops provide nearly every essential looked for in a soiling crop. Barley is not often recommended on account of its beards but there seems very little reason why a large strawed sort cannot render valuable service.

The Winter Rye might be used more widely than it is. There should be little difficulty occasioned in growing it successfully in New Brunswick. It is a very hardy plant, growing rapidly and thriving on a wide range of soil conditions. All these peculiar qualities combined with its earliness and productiveness commend it very highly as a soiling crop. This because of the fact that Winter Rye is seeded in the fall for the following season's feeding.

The Hairy Vetch is a Winter annual and may be used in conjunction with Winter Rye to increase its palatability and nutrition. Moreover the Vetch like the Rye persists to grow after being cut, thus combining well to provide a second cutting. Oats are also sown with the Hairy Vetch with fair success but while they mix well to produce a good feed they fall off appreciably in yield. Moreover the high cost of Hairy Vetch seed restricts its use very materially.

The Common Vetch is not so expensive but unfortunately it does not give economical yields. With Oats however, where Peas cannot be grown this crop is worthy of a trial.

Alfalfa stands high in the estimation of Dairymen as a green feed. Many of you present may feel that alfalfa cannot be grown in this province, but I see no valid reason why every county should not some day grow profitable crops of this almost perfect soiling plant. The failures thus far to obtain satisfactory crops can be attributed in many cases to a lack of acclimatization of seed used and in part to cultural methods employed. The alfalfa plant is most exacting in its demands as to soil, situation and cultural methods. As a soiling plant one could scarcely imagine anything approaching nearer perfection. It provides an almost continuous supply of green feed, closely approximating bran in feeding value; in profitable quantities and of a kind that all classes of live stock eat it with the keenest relish.

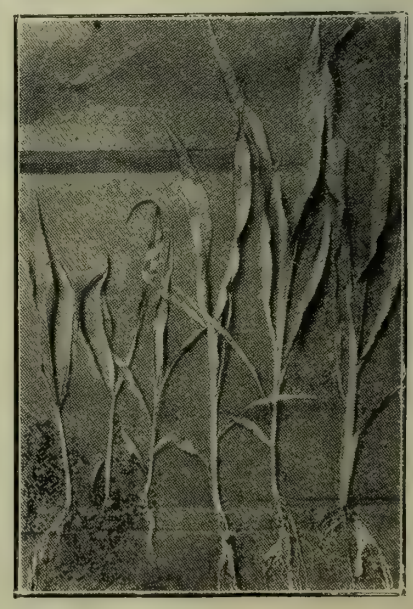
Corn has in most countries played a very important role as a soiling crop. In New Brunswick much care should be exercised in the choice of variety. There are few of the large ensilage sorts which warrant using in this climate. The growing season does not permit sufficient maturity of stalk and ear. Dairymen must confine their attention to the Flint sorts-sacrifice quantity for quality and thereby produce a feed of superior feeding value. The Longfellow and Quebec yellow and others of this class should not be overlooked, the former produces a surprising amount of fodder of good quality while the latter matures in a shorter season but cannot compete in point of yield.

The Rape crop cannot be omitted, while many take exception to this crop for milch cows on the grounds that it imparts a flavor to the milk; others favor it. Nevertheless in succulence few crops equal rape and in nutrition it compares very favorably with the clovers. Rape can be grown abundantly in New Brunswick. Any well prepared soil of average fertility, drilled in rows if foul; broadcasted if clean will return profitable yields of exceptional value.

The millets might be mentioned here although they take an inferior position, as a soiling crop. They lack succulence, palatability, and nutrition being more useful as a secondary crop in meeting an emergency. Their chief value lies in supplementing the stall fields as a hay fodder.

I have not discussed the root crops in this relation as such would be presumption on my part before a New Brunswick audience. Few people in this vast country can produce better roots or in greater abundance than you can. As a soiling crop mangels and turnips are almost unequalled. They possess every essential in a form which affords almost complete digestion. As a feed therefore they can fill in admirably.

Thus many crops commend themselves for soiling purposes. These when properly arranged can be made to provide a continuous supply of green fodder throughout the entire season. Where Dairying is followed extensively such an arrangement would doubtless help out backward pastures in the spring and dry pastures in the summer and fall. For where the crop was not needed for soiling purposes when it reached its proper stage (blossoming) it could be cut and cured for winter feeding.



Strong Vs. Weak Seeds.

Corn plants from strong and weak seeds. Plant only seeds of strong vitality ascertained by testing previous to planting.

Methods Employed in Eradicating Noxious Weeds.

Weeds Increase Cost of Production.

Ewing Cup A. E. Maclean, Lot 16, P. E. I. Richards' Cup

An enthuastic member of the Canadian Seed Growers' Association and the silver cups won by him for the largest and best exhibits at the P. E. I. Provincial Seed Fair, Summerside, and at the Maritime Winter Fair. Mr. MacLean is also interested in the Black Fox Industry.

THE greatest difficulty in the way of producing a more abundant supply of clean clover and grass seed, as well as seed grain, is the prevalence of weeds. In order to produce high class clean seed, farmers must be constantly on the alert to keep the weeds on their farms in check and prevent the introduction and spread of new varieties. In various ways weeds lower the yield, depreciate the quality and value of crops, and add to the cost of production. They rob the soil of plant food and of moisture, thus increasing the effects of drought by taking up water from the soil and wasting it by evaporation; they crowd out more useful plants, being hardier, and, as a rule, more prolific; they increase the cost of every farm operation and cause depreciation in the market value of crops because of the presence of weeds in hay or of weedseeds in grain; the eradication of the worst weeds is costly in labor, time and machinery, and frequently prevents a farmer from following the best crop rotation or from growing the most advantageous crops; many weeds are conspicuous and all are unsightly on farms, and thus depreciate the value of land; some weeds are harmful to stock, while others are injurious to their products; weeds attract injurious insects and harbour fungus diseases.

New weeds are introduced on farms with grass, clover or other commercial seeds, and commercial feeding stuffs which often contain vital weed seeds. They are spread from district to district through various transportation facilities, such as railways, and become disseminated within a locality in stable manure from towns and cities, and through threshing machines and farm implements. The wind carries some weed seeds long distances, not only in summer but with drifting soil and over the surface of the snow in winter. Streams distribute them along their courses. They are also distributed by seed-eating birds and herbivorous animals, through the stomachs of which the seeds pass undigested; or they attach themselves by special contrivances, such as hooked and barbed hairs, spines, gummy excretions, &c., to passing animals.

CLASSIFICATION AND ERADICATION.

Weeds are classified according to the length of time they live, as annuals, or one-year plants; biennials, or two-year plants; and perennials, or many-year plants. In eradicating weeds it is of the greatest importance to ascertain under which of these heads they come.

ANNUALS.

Annuals complete their growth in a year. As a rule, they have small fibrous roots and produce a large quantity of seed. Some weeds, called winter annuals, are true annuals when the seeds germinate in the spring, but they are also biennial in habit; that is, their seeds ripen in the summer, fall to the ground, germinate and produce a certain growth before winter sets in, and then complete their development next spring. Annuals may be eradicated from land, however badly infested it may be, through any method by which germination is hastened and the young plants destroyed before they produce seed.

BIENNIALS.

Biennials require two seasons to complete their growth, the first being spent in collecting and storing up a supply of nourishment, which is used the second season in producing flowers and seeds. Biennials must be either plowed or cut down before they flower. Mowing at short intervals in the second year, so as to prevent the development of new seeds, will clear the land of this class of plants; but a single mowing will only induce them to send out later branches, which, if not cut, will mature many seeds. Where plowing is impracticable, such plants should be cut off below the crown of the root.

PERENNIALS.

Perennials are those plants which continue to grow for many years. They are propagated in several ways, but all produce seeds. Perennials have two distinct modes of growth; some root deeply, while with others the root system is near the surface. The most troublesome are those which extend long underground stems or rootstocks beneath the surface of the ground, as Canada Thistle, Perennial or Field Sow Thistle, Field Bindweed and Bladder Campion. Representatives of the second class or shallow-rooted perennials are Pasture Sage, Yarrow and Couch Grass. Some perennials extend but slowly from the root by short stems or offsets, but produce a large quantity of seed. Of these, Ox-eye Daisy, Dandelion, Goldenrod and Yarrow are examples.

Perennials are by far the most troublesome of all weeds and require thorough treatment, and in some instances the cultivation of special crops, to insure their eradication. Imperfect treatment, such as a single plowing, often does more harm than good, by breaking up the rootstocks and stimulating growth. For shallow-rooted perennials, infested land should be plowed so lightly that the roots are exposed to the sun to dry up. For deep-rooted perennials, on the other hand, plowing should be as deep as conveniently possible. The nature of the land must determine the depth of plowing. In light or gravelly soils shallow plowing may be preferable as deep plowing might interfere with the mechanical texture of the soil, which is so important in the storing of moisture.

The rootstocks of some perennial weeds are very persistent. Some sections or cuttings from them will quickly take root when they are distributed by plowing or cultivation. Where such persistent perennials have become well established, it is usually advisable to adopt the most convenient method of cultivation that will bring the rootstocks to the surface. They should then be gathered and burnt or otherwise destroyed. Most perennial weeds will, however, succumb to continued thorough cultivation that will prevent the growth of leaves.

Plants take in most of their food through their leaves. Perennial plants, which live for many years, have special reservoirs where some of this food, after elaboration, is stored in such receptacles as bulbs, tubers and fleshy rootstocks. The first growth in spring, particularly flowering stems, is produced mainly by drawing on their special store of nourishment. Plants are therefore in their weakest condition when they have largely exhausted their reserve supply of food and have not had time to replenish it. The stage of growth, then, when plowing will be most effective is when their flowering stems have made full growth but before the seeds, which would be a source of danger, have had time to mature.

SUMMER FALLOWING.

The practice of summer-fallowing land, whatever may be said against it, affords the best opportunity to suppress noxious weeds. For lands foul with persistent growing perennials, a thorough summer-fallow will usually be the most effective and, in the end, the least expensive method of bringing the weeds under control.

The amount and nature of the cultivation of a summer-fallow will depend on the habits of the weeds, the kind of soil, and the climatic conditions. In some extreme cases of perennial weeds, it may be advisable to allow the plants to exhaust their reserve vigor by growth until the flowers are formed, then cut and remove the surface growth, plow to a depth of four or five inches, and bring the rootstocks to the surface before they have had time to renew growth. After cutting and removing the surface growth cultivators may, after several applications, be forced to the bottom of the furrow, thus unearthing the network of rootstocks. Perennial weeds having deep rootstocks may require a second and deep plowing before all the underground vegetation can be unearthed. If perennials alone are to be dealt with, they may be treated as above directly after an early hay crop.

When the destruction of annual weeds is the chief purpose of cultivation, deep plowing two or three times during the summer, with surface cultivation each week during June and July, and less frequently later in the season, should secure the germination and destruction of the maximum number of seeds. On account of the soil and climate, one plowing of summer-fallow is favoured in the Prairie Provinces.

SHORT ROTATION OF CROPS.

To keep farms free from weeds, few methods give such good results as a systematic short rotation of crops, with regular seeding down to grass or clover at short intervals. Weeds are most in evidence in districts where the production of cereal grains predominates and where the systematic alternation of crops is not generally practised. Thorough cultivation with a systematic rotation of crops, combined with the maintenance of as many sheep as can be kept to advantage, is a certain and profitable means of keeping weeds under control.

SEEDING TO GRASS.

Lands foul with some kinds of weeds, particularly annuals, may advantageously be seeded to grass for hay or pasture. The cultivation of hoed crops becomes too expensive for labor when the soil is polluted with weed seeds. Grain crops may also be unprofitable because of weeds, and they afford an opportunity for the weeds to increase. Seeding to grass and cutting the hay crop early will prevent most kinds of weeds from ripening more than a relatively small number of seeds, and the number of vital weed seeds in the sub-surface soil will rapidly decrease from year to year. If perennial weeds are also prevalent, it would be well to pasture with sheep and mow the roughage closely each year, before the spring growth has formed seeds.

FARM IMPLEMENTS TO DESTROY WEEDS.

The best time to destroy weeds is within two or three days after the first pair of leaves has formed on the seedling plant. In friable soils the 'weeder' is a useful implement for that purpose. The 'tilting' harrow is also satisfactory for comparatively loose soils and is preferred as a weed destroyer on firm or clayey land. Weeds are irregular in time of germination; consequently it is necessary to apply the weeder or harrow frequently throughout the growing season. Fields of potatoes, corn and cereal grains, when sown with a drill, may advantageously be treated with these weed destroyers once or twice before the crop distinctly shows above ground, and again, with corn and ordinary grain crops, when the plants are three to six inches high. Even relatively heavy harrows ordinarily in use will do little damage to the potatoes, corn or grain plants if the land is not wet, and the loosening of the surface soil benefits the crop in addition to the destruction of the weeds.

For perennial weeds, or seedlings that have become well rooted, a cultivator having diamond shaped or other relatively broad shares is needed for hoed crops. The disc is a favoured implement for destroying weeds in summer-fallow or in preparing a seed bed. When, however, it is desired to unearth and remove the root stocks of perennial weeds such as Couch Grass, a narrow-toothed cultivator, that will loosen the soil and bring the underground vegetation to the surface, is preferred to an implement that will cut the rootstocks, the small cuttings of which may be exceedingly persistent in growth.

HAND WEEDING SEED CROPS.

Even with the greatest care and the best of cultivation some weeds are almost sure to appear in clover and grain crops intended for seed and the only practical means of handling them successfully is hand pulling or spudding. With clover seed crops especially it is essential that the fields be carefully gone over and the weeds removed or destroyed before they go to seed. Failure to do this often results in the production of clover seed that is badly contaminated with weed seeds and its market value is thereby greatly reduced or entirely destroyed.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

COUNTY VICE-PRESIDENTS' REPORTS.

On other pages of this issue will be found the reports submitted by the County Vice-Presidents of the New Brunswick Farmers and Dairymen's Association to be read before the recent convent at Fredericton. Several of the sereports were read while others remained unread and none of them were discussed.

We believe each and every Vice-President's county report should be read and then be handed to a committee to pick out the most salient points and have these matters brought out for discussion.

Several ideas are set forth in these reports to the consideration of which the association might well devote some time.

One of the primary objects of the Association is to be a regular farmers' parliament where subjects of vital interests to the various sections of the province may be discussed and forwarded, under the auspices of the farmer fraternity, through proper channels to the notice of the powers that be.

We do not believe in running to the government with every little idea that Tom, Dick or Harry may suggest. Select the wheat from chaff by considering the important questions and with the sanction of the farmers in the form of strong resolutions behind them the powers that be cannot fail to take steps to legislate on these matters.

Even the good ideas embodied in the President's address were not discussed. In the framing of next year's programme we trust ample time will be devoted to discussions on questions of general interest to the farming fraternity. It would also be a good idea for every agricultural society in a county to forward suggestions to their county Vice-President so that he may embody them in his report. In this way the reports would voice the sentiments of a greater number of farmers.

MAKING FARM LIFE ATTRACTIVE.

It is human nature to wish for the things that are just out of reach. Thoroughly acquainted with the unpleasant features of the present occupation, one learns mainly of the brighter side of the work and amusements of other people. The darker side is kept in the in the background by the effort of people to present a brave front to the world. Thus city people look longingly toward the country, while farmers' sons and daughters imagine that the city holds the greater measure of opportunity and happiness.

The traffic experts of city interurban lines find that the young people within the radius of interurban transportation gain increased contentment in farm life. While still living on the farm they are enabled to enjoy the advantage of city friendships, sights and amusements. They also learn of the hardships of city life without suffering from them. With an understanding of both sides of city life, boys and girls reared in farm families are likely to choose the free, healthful, substantial life of the country.

The extention of agricultural education to rural schools is solving another phase of the problem of keeping the boys and girls on the farm. Fully informed regarding the possibilities of profitable farm practices. the young people see the wide-open door to a full measure of satisfaction in rural life. These teach the children the very latest discoveries in scientific discoveries. Accustomed to rural life, informed from childhood on farming methods, and by direct observation fortified against the seductions of the city, the children should grow into a contented enjoyment of rural prosperity.

EVERY LINE OF IT IS READ

Woowards Cove, Grand Manan,
March 26th, 1912.

The Maritime Farmer,
St. John, N. B.

Gentlemen: I should say "the Maritime Farmer" must be considered a great authority among the farming population. If my correspondence is any evidence they certainly read every word in it. As for instance one women signed herself enthusiasticaly "Mrs. C. W., a faithful reader of the Farmer," (her very words.) So many say I would like eggs of turkeys or geese as the case may be, and nearly always end with the information "I raise lots of poultry but only the common kinds. You ought to tell them in a tactful way that there is no law against raising something uncommon if they want to. Would you kindly change my ad. Copy enclosed.

Very Sincerely,
SARAH E. MOSES SMITH.

I. C. R. TO RUN "FARMING SPECIAL."

Farmers along the line of the Intercolonial Railway in New Brunswick will have opportuni. ty next June to take advantage of lectures on "better farming" to be delivered by members of the staff of the Provincial Government Department of Agriculture, in connection with the tour of the "Better Farming Special" train. The Intercolonial Railway will furnish the exhibit train, which will consist of three baggage cars laden with specimens for illustration and demonstration, a passenger car where the lectures are to be given, and a car for the habitation enroute of the officials in charge. The train will start from Fredericton about June 20th and its stop is governed by a schedule which will be announced at a later date. The principal points along the Fredericton Division, to Blackville, will be visited, thence via the Indiantown Branch to Millerton and thence to Newcastle aud Chatham.

From here the "Farming Special" will proceed East as far as Sackville, making stops long enough for lecturing purposes at Barnaby River, Rogersville, Harcourt, Memramcook and Dorchester. Returning to Moncton where a two hours, stop will be made, the schedule will then cover Salisbury, Petitcodiac, Sussex, Norton and Hampton. The North Shore will then be visited and stops made from Bathurst to Campbellton and Dalhousie, after which tne train will return to Fredericton.

The object of the tour of the "Farming Special" is to instruct the farmers in the more advanced and scientific method of agriculture and the exhibit material carried on the train is merely for the purpose of demonstration. A hearty invitation will be extended to farmers all over the Province to assemble at the most convient railway point on the day scheduled for the visit of the train, and attend these lectures, and bv questioning and inspection gain whatever knowledge or enlightenment they may require.

These "farming specials" have been run in Ontario and the West with most satisfactory results, and they should prove a great benefit to the farmers of New Brunswick.

PROGRESSIVE PICTOU COUNTY FARMERS.

The farmers of Pictou County, N. S., are a live body as will be seen by the following news item from the columns of a recent copy of the Westville Free Lance:—

"Under the auspices of the Pictou County Farmers' Association a company has been incorporated, to be known as the Pictou County Ditching Company, Limited, for the purpose of buying a Buckeye Traction Digger to be operated in the County of Pictou. This machine costs in the vicinity of $3,200.00, landed in the County and is similar to the one imported two years ago by the Provincial Government. The officers are: H. S. Kennedy, Alma, President P. C. F. Assn. President; Dan Macdonald, Director N. S. F. A. Sylvester, Vice-President; Harold Falconer, Sec. P. C. F. A. Alma; James W. Maxwell, Director P. C. F. A.; C. R. B. Bryan, Sec. N. S. F. A., Durham, Directors of the company. The head office is at the residence of C. R. B. Bryan, Durham, who is acting as the Sec'y Treasurer. They are issuing $4,000.00 worth of stock in 800 shares at $5.00 each, fully paid and non-assessable. Quite a number have been bespoken and anyone wishing for application forms should apply at once to the Secretary.

This should be of great advantage to the farmers, as they can underdrain their land quickly at a great reduction in cost to hand digging. The machine can do a lot of work in a day, and if it gets fairly steady work should earn a good dividend. The County Farmers Association is progressive."

The Pictou County farmers are on the right track. They understand the benefits that follow in the wake of a thorough system of under drainage. They have taken note of the advantages offered by the Buckeye Traction Ditcher imported to Nova Scotia for demonstration purposes by Prof. M. Cumming of the N. S. A. C and are following in the line of advancement, that Prof. Cummings' action in introducing this machine was destined to accomplish.

EDITORIAL NOTES.

In ordering seed from any seed company examine it closely and test it. Seed companies—at least certain kinds—often send out some pretty poor seeds when their supply gets low, and it is just as well to know what you are planting, especially when you expect to put in a season's labor trying to make a living from this seed.

Lime Sulphur Demonstration at Berwick.

Conducted by the Berwick FruitCo.

Address by L. D. Robinson.

ON the afternoon of the 3rd inst., a meeting af the Berwick Fruit Co. was held at their spacious warerooms, for the purpose of demonstrating the merits of the home-made Lime-Sulphur concentrate. The demonstration was highly successful. A clear concentrate was produced testing 27½ degrees Beaume and containing very little sediment. Previous to the demonstration an address was given by the writer, which was designed to prepare the way for what was to follow. The Company were under obligation to J. N. Chute, their able manager, for the loan of his boiling apparatus, as well as for the materials used, in the demonstration.

THE ADDRESS.

Although the history of Lime-Sulphur is brief, yet many changes have taken place both in its manufacture and the uses to which it has been applied. It was first made with salt as one of its components and used as a sheep dip. Later this combination of lime, sulphur, and salt was used with great effect against scale insects infesting fruit trees. It was early discovered that salt was not necessary for the extermination of scale pests. To Prof. Lordly of the Agriculture Station, Oregon, belongs the honour of the discovery, that weak washes of the Lime-Sulphur combination could be used effectively in controlling apple scab without russeting the fruit.

The winter wash made according to the formula, 20-15-40, or 20 lbs. lime and 15 lbs. sulphur to 40 gallons of water proved very unsatisfactory as a summer spray, partly because it must be applied hot and partly because of variations in strength. Soon, however, the commercial concentrates of Lime-Sulphur appeared and the triumph of Lime-Sulphur over Bordeaux mixture was complete. Several investigators now turned their attention to the making of a home boiled concentrate, with the result that it is now possible for any fruit grower to make a Lime-Sulphur concentrate that is in every way equal to the commercial article, except in strength. Professor Stewart, of the Pennsylvania Station, developed the most approved method of making the home made concentrates. He made the discovery, that a formula consisting of 1 lb. lime, 2 lbs. sulphur to each gallon of water, would give excellent results. This is represented thus 1-2-1

The lime should contain 90 to 100 per cent. calcium oxide and be free from air slaked matter. The sulphur may consist of flowers or flour of sulphur. Soft water will give better results than hard water.

Applying Strong Lime Sulphur Wash in April in a New Brunswick Orchard.

Gathering Brush—Trees in background not Pruned.

Clean Cultivation in a New Brunswick Orchard.

APPARATUS.

This consists of a boiler, a measuring stick and a hydrometer—the whole of which should not cost $10. The boiler should be about 6 feet long, 3 feet wide and 12 to 18 inches high. It can easily be constructed by making a rectangular box of 2 inch plank firmly spiked together, having a sheet iron bottom double nailed. This box should rest on a foundation of cement, or brick somewhat smaller than the boiler so as to insure the wood work against fire. A piece of 7 inch stove pipe, consisting of not less than two joints, should be built into one end of the foundation and an opening about 15 inches should be left at the other for the purpose of feeding in fuel. A 1½ inch hole should be bored near the bottom of the boiler so as to facilitate drawing off the liquid. The boiler should have a cover to keep in the heat with a narrow slit running lengthwise through which a hoe or some other stirrer may be worked.

The measuring stick is simply a rod held upright in the boiler while it is being filled, notches being cut in the stick to mark the height of water when 5, 10, 15, etc., gallons have been placed in the boiler. Nails driven into the planks would serve the same purpose. The use of the hydrometer will be explained later.

HOW TO MAKE A LIME-SULPHUR CONCENTRATE.

Put 15 gallons water into the boiler and start a brisk fire. When the water begins to get somewhat warm, put into it 55 lbs. best lump lime free from air slaked matter. As soon as the lumps have crumbled dust in 110 lbs. (one bag) of dry sulphur free from lumps, stirring the mass vigorously meanwhile and adding water from time to time so as to maintain a thin paste. After the whole has become thoroughly mixed, gradually thin it by adding water, preferably hot, till the liquid reaches the 60 gallon mark. The extra 5 gallons will help to make up the loss through evaporation. It does not matter however, whether the number of gallons at the close is exactly in accordance with the formula, but it is better to keep as near the mark as possible. Water may be added during the process of boiling but it should be hot so as not to stop the boiling. Bring the mass speedily to a boil, and boil vigorously for a full hour with constant stirring, especially during the earlier stages. Much of the success attending the making of concentrates depends upon keeping up a strong heat.

HOW TO MAKE A WASH OF ANY DESIRED STRENGTH.

The hydrometer is absolutely essential in making washes, suitable for use on foliage, from the home-made concentrates. The margin between the effective strength and danger point of a summer wash is narrow. Even in the case of the commercial concentrates the hydrometer should always be used especially when making washes for foliage. The rule—3 to 40 for dormant spraying or 1 to 40 to summer work is at best only a makeshift. It has been proved by experiment that a wash suitable for dormant spraying should have a strength of 1.03, that for use just as the blossom buds are bursting, 1.009; and that for use after two-thirds of the blossoms have fallen, 1.008.

Place the hydrometer in a portion of the concentrate, and when it comes to rest, note the reading of the surface of the liquid—the first figure of this will be 1, a whole number, the rest a decimal. The proper dilution is found by dividing the decimal of the concentrate by the decimal showing the strength of the wash desired. Example—Suppose the strength of a concentrate is 1.225 and we wish to make washes with strength 1.03, 1.009 or 1.008. We simply divide the decimal .225 by the decimal .03, thus .225 divided by .03 equals 7.5—that is one gallon of concentrate to each 6½ gallons of water for dormant spraying. Similarly .225 divided by .009 equals 25, that is 1 gallon concentrate to 24 gallons water for use just as blossom buds burst.

IT WILL PAY TO MAKE HOME BOILED CONCENTRATES.

At the present prices of commercial Lime-Sulphur it will undoubtedly pay the farmer who has more than 8 acres of orchard, to make his own Lime-Sulphur. The cost of the home boiled Lime-Sulphur is small compared with the profit, and, as has been shown, the operation is simple. Moreover, this work can be done in April when farm work is not urgent. Co-operative companies should find it very profitable to manufacture the Lime-Sulphur used by their members. In the case of co-operative manufacture it would be more economical to use steam for boiling than dry heat.

In the figures given below 2 cents per lb. has been charged for sulphur and ¾ cent per lb. for lime. These were the figures paid for these materials by the writer, last year. By buying these materials in large quantities a great saving could be effected. It is considered a fair assumption that the value of a Lime-Sulphur concentrate varies as its strength. Lime-Sulphur sold in Berwick last year for about $7.00, the buyer returning the barrel, or at about 17½ cents per gallon clear of the barrel. The average strength of this commercial concentrate was 32 degrees Beaume.

DR.

To 110 lbs. Sulphur @ 2c. per lb. $2.20
To 55 lbs. Lime @ ¾c. per lb. ..... .41
" Fuel ..... .20
" Labour ..... .50

$3.31
4.51

Balance in favour of the Home Made Concentrate 4.51

By 55 gallons concentrate 26 degrees Beaume test @ 17½c. per gallon Beaume test 32 degrees.

$26 x 55 x 17½ / 32 equals $7.82

After Spraying With Lime and Lye.

N. B. F. & D. A. County Vice Presidents' Reports.

Needed Improvements Solicited.

1911 Crop Conditions.

Following are the reports submitted by the County Vice-Presidents at the recent N. B. F. & D. A. at Fredericton, N. B.:—

ALBERT COUNTY.

It becomes my duty as Vice-President for the County of Albert, to make a short report as to the agricultural conditions in this County, but first it becomes us (as citizens of this great and growing Canada, loyally united to the greatest Empire on earth) to give thanks to the Almighty, Allwise and Beneficient Ruler of the Universe, for another year of peace and prosperity.

I would say that I have had no communications from any Parish in the County excepting Hillsboro, but from personal observation I think I am safe in saying, that, taking the products of the year as a whole, we have had a good average yield. Of wheat and barley not much can be said as our people do not produce them to any great extent, although I have seen some small fields, which showed good samples of those grains. Oats which is a large part of our field crops was hardly up to the average, the straw as a general thing being lighter than usual, but in the early sown, fine heavy grain was produced. The buckwheat, as a rule was very light, some fields hardly producing enough to pay for sowing and harvesting expenses, and I might here say that to my mind with respect to this crop, many farmers make the mistake of thinking that any kind of worn-out land with the poorest possible culture is sufficient, which is far from being the fact. Potatoes all over the county yielded abundant crops, perhaps the best we have had in many years and in addition to big crops brought record prices. Turnips and other root crops might, I think, be called an average though not so good as the previous year. The apple crop was excellent and of a superior quality, partly I think on account of the favorable season, and partly on account of the supervision and painstaking instructions of our horticulturist, A. G. Turney Esq. Of the smaller fruits I am not able to furnish any information. The hay last season was considerably below the average crop, but by a little shifting, there will be more than is fed before the new cut.

With regard to our Elgin Agricultural Society, would say, that for the past few years we have not been up to the standard, having failed to introduce pure blood in our stock, but we have a new secretary this year, who is a progressive farmer and a hustler and we are hoping for a much better future for our society. The society at Hillsboro lately instituted is going ahead by leaps and bounds. In their horse breeding for draught purposes they have been using the "Shire" principally until last year the farmers bred to a Percheron. The society owns five Shorthorn bulls and one Holstein. The Yorkshire and Chester pigs have the preference. In sheep the Shropshire and Cotswold are the breeds most raised, but on account of the dog nuisance they report not many kept, they also report hay and grain crops light but apples an extra crop.

There has been something said about suggestions on Immigration, but perhaps men of wiser heads and larger experience in that line would do better in discussing that matter. To my mind it is a vast problem while everybody who is anxious for the development of our whole country heartily wishes a larger increase of a good quality of Immigrants and are willing to give every encouragement, yet many hold that if we could solve the problem of keeping our native born at home it would tend more perhaps to build up a wise, strong and loyal people such as is desired to make Canada great. And if a scheme could be devised to give our young men something which they could hold in possession and call their very own, before they scented other lands, I think that would overcome the difficulty.

But we must not make our reports so long that we weary the hearers, so I will close by saying that I believe that if this fair Province was sufficiently advertised it could be filled with a happy contented people, who would believe with us that the sun shines on no fairer, better land in which to dwell.—Robert A. Smith.

Baron Primrose—A Sire of Prize Winners.

Champion Clydesdale Stallion at the 1912 Maritime Horse Show, Amherst, N. S.
Owned by C. R. H. Starr & Son, Port William, N. S.

CARLETON COUNTY.

The spring of 1911 opened somewhat earlier than the two preceding springs so the farmers were able to get on their land early. Seeding began the first week in May and with a continual drought all through the month, it afforded an excellent time for getting in crops of all kinds. During the month of June we had considerable rain with somewhat more showers in some parts of the County than others—on a whole a fairly good growing month.

Haying began about the 12th of July. Owing to the early drought the hay was not more than two-thirds of a crop; but on low land that was under good cultivation there was a fairly good crop.

The grain crop also was affected with the drought. Oats was not up to the average, although the quality was good and it was harvested in fine condition. Wheat was probably below the average. Grain, dry and of fine quality. Early sown buckwheat did not give more than half a crop; that which was sown the latter part of June was considerably better. Potatoes, turnips, and all root crops were somewhat above the average. Potatoes were of fine quality and housed in excellent condition. Owing to the high price of potatoes, a large acreage will be planted this year. In some sections of the County farmers are selling off their stock, buying fertilizer and planting a large portion of their farms in potatoes.

Fruit of all kinds yielded abundant crops, much above the average.

Our cattle consist of a mixed grade of Ayrshires, Holsteins, and Shorthorns. The milk is made into butter at home.

Owing to the increasing demand and high prices for all kinds of farm produce, and with bright prospects for better railroad facilities, the farmers of the County are looking forward to a bright and prosperous future.

On a whole Providence blessed our County with a bountiful harvest and the farmers in marketing their produce are reaping a rich reward. Let us hope that they will work for the best interests of our Country, continue to prosper, and make their lot a happy one.—Robert J. Ronald.

CHARLOTTE COUNTY.

I have the honour to submit herewith a short report on agriculture in Charlotte County. The spring was dry and cold until June after which we had plenty of showers.

Hay was a good crop and was well made and stored.

Oats was very good, both in quality and quantity and was well harvested.

Buckwheat was a very good crop.

Wheat is very seldom grown in Charlotte County. Potatoes were of a very good quality but in some places there was not many in a hill. All field roots and garden stuff as well as all small fruits yielded good returns.

Our apples were of good quality and most of the trees bore well. Forest Tent Caterpillars were very numerous in most places and did a great deal of damage to the trees.

Last year we had four societies in good standing. Nos. 88 and 26 both held fairs and they were quite creditable. No. 120 imported four pure-bred Ayrshire bulls and placed them around among the members of the society. Our farmers are getting very much interested in pure-bred stock of all kinds.—E. E. Emmerson.

GLOUCESTER COUNTY.

Spring opened early. Crops got in in good condition. General growth fair, but the season was too dry for rapid growth.

Hay an average crop. Haying season good and the crop well stored. Oats an average crop and grain heavy. Not much wheat grown in this section, but what was grown turned out a good crop. Barley a fair crop, but not much grown. Potatoes a good crop for the quantity that was planted. Owing to the potato bugs, not much planted. Stored in cellars in good condition, and prices higher than usual. Turnips an average crop. Carrots and beets a fair crop.

Fruit an average crop.

Stock:— Cattle are principally Ayrshire, a few Shorthorn and Holstein. The Society imported Yorkshire, White Chester and Berkshire pigs, and get good satisfaction from the stock. Sheep make a good showing. Breeds are mostly Leicesters, Shrops and a few Hampshires. Owing to the dogs, not so many kept as a few years ago.

The Government promised us a grant to hold an exhibition this fall in Bathurst for the Counties of Restigouche and Gloucester, and, no doubt, they will fulfil their promise. —John Miller.

KENT COUNTY.

I beg leave to submit herewith a brief report of the agricultural situation in the County of Kent during the past year.

The spring of 1911, while a little cold and backward was fairly favorable for seeding and conditions during the summer were especially favorable for the growth of the different crops. While there was at times too much rain for good harvesting, yet on the whole crops were saved in good condition, although some of the oat crop suffered slightly from the effects of the heavy rain during the harvesting period.

The yield of all crops was above the average. The hay crop, while not so heavy as the record crop of the previous year was satisfactory, and the hay was of excellent quality and saved in good condition. In some cases in the Northern end of the county the wheat was attacked by rust and a number of farmers lost their whole crop, but these cases were not numerous. Oats, as a rule, yielded well and were generally harvested safely, except in some instances of damage through bad weather conditions. The buckwheat crop was above the average.

Potatoes were a first class crop. The turnip crop was lighter than that of the previous year.

The market for potatoes was unusually good in the fall of 1911, the shipments from Richibucto and Rexton particularly being many times greater than in any previous year. Farmers within a practical hauling distance of these points reaped the advantage of this demand, but in the extreme northern end of the county, the distance from the nearest railway and the consequent long haul, rendered it impracticable to sell. These districts feel the need of better railway communication.

The price of grass and clover seed at present high and showing a constant upward tendency, would seem to make it almost obligatory upon the farmers to consider the advisability of producing these varieties of seed upon their own farms. Any suggestions from the members of the Association along these lines would be appreciated.

On the whole I feel that the farmers of Kent County are showing a

renewed interest in acquiring improved methods of cultivation, and that their condition is steadily improving.

Submitted with best wishes for the prosperity of our Association.—M. J. Poirier.

KINGS COUNTY.

In regard to agricultural conditions in the County of Kings, I shall first call your attention to the fact that according to the census just taken the County has had a decided falling off in population, and it is regretable to note that those who left were for the most part from farming districts. Whole sections of highland farms have been vacated, and places which were the homes of large families have become, through lack of knowledge in rotation of crops, or bad management, and poorly handled fertilizers, an almost barren place; but, on the other hand through sections of the river valleys and along the railroad where dairying is more prominent, the farms present a more flourishing condition; and I think it would be well to call the attention of the Department of Agriculture to the fact that when sending out Institute speakers, a man could be sent who is familiar with conditions similar to those required in the place where he is to speak.

The dairy herds throughout the County are in an average condition, and farmers are beginning to realize the necessity of better care during the winter months. Some have already erected new and more modern barns while others are preparing to build in the near future.

The Government's aid in behalf of the dairyman could be given in two ways, first, by protecting the producer of a first class article from the inferior qualities brought into competition, and second, by helping to keep down, and drive out, the much dreaded disease of tuberculosis.

The protection of a good article might be accomplished after the same plan as now exists on fruit and maple products, or by compelling the producer to have his name and Post Office address placed on every package; and as the public in general are concerned in regard to the disease of tuberculosis, the neglect and expense of the farmer to find out about its presence in his herd might be overcome, by having an inspector qualified to inspect all dairy herds, and where animals showed symptoms of disease to make a positive test.

During the past season the supply of pork has been good but the prices were considerably lower than on the previous season.

The field crops in general were on an average. A dry period in the early part of the segson made the hay and grain crop in the Eastern part of the County rather light, while in the Western part the moisture from the river produced a decided increase. Vegetables were an average or better, while potatoes were good. A few trial plots of Alfalfa throughout the County have proved very successful.

Small fruits were below average, and though they gave prospects of a good crop, tne dry season caused early ripening, which prevented full maturity. Considerable interest is now shown in the setting of new orchards in connection with the other farming, and everything points to better days.—Edgar Shamper, Kingston, N. B.

NORTHUMBERLAND COUNTY.

The spring of 1911 was dry and favourable for seeding. Many farmers had their potatoes and grain in the ground by the middle of May.

The early part of June was also very dry and crops suffered considerable on light soil. The later part of June and July was very rainy which helped the crops greatly.

Hay was a fairly good crop but not as heavy as in 1910.

At the beginning of the haying season we had some wet weather. Farmers who began cutting early stored their hay in poor condition, but the month of August was finer and a quantity of good hay was housed.

September was a fine month and grain ripened early. Oats was a medium crop, but not much grown here, as we have no grist mill nearer than 22 miles—at Rogersville.

Potatoes were a good size and of extra quality but not very plentiful in ground. Turnips and mangels were an average crop but not so extensively grown in this district as they should be. Small fruits, such as strawberries, raspberries, and blueberries were very plentiful. Apples are not extensively grown in this section, but varieties grown are of good quality.

Our live stock is gaining in quality. The principal pure-bred herds of cattle are: Ayrshire, Shorthorn, and Holsteins. In pure-bred horses we have some fine Clydesdales and Hackneys also a Percheron stallion.

Sheep raising is decreasing on account of the ravages of dogs.—W. M. Johnston.

QUEENS COUNTY.

The summer of 1911 will be remembered in Queens County as one of exceedingly fine weather—a splendid spring for putting in crop but a little too fine and dry for early growth, (a condition that reduced the crop of hay, which otherwise would have been an excellent one as the seeded ground wintered well).

Frequent snowers during the month of June gave all crops a good start, so that even the hay crop was above the average. Potatoes were an exce,-lent crop, both in quantity and quality; oats, better than for the last two years; buckwheat, rather poor, (mainly on account of being sown too early); turnips and garden stuff fairly good.

On the whole—good crops—many expressions to that effect heard at the end of harvest from those who farm.

Of course there is a wail—with many—a sad and bitter wail—"The harvest is past, the summer is ended and we have nothing. To be sure we sowed nothing. Too poor a prospect for us to plow and sow in May. The ground burning up with drouth. Oats a month coming up. We hired to drive and raft at $2.00 a day, but the job only lasted till about the first of June. Fine growing weather now. If we had only planted potatoes and sowed oats and put in a good garden it might have paid us after all—too late now. Prices March 1st—Potatoes, $2.50 to $3.00 per bbl.; Oats, 70 cents per bushel; Buckwheat, about 75 cents; Middlings, $1.65 per cwt.; Bran, $1.50; Beefsteak, 18 cents per pound. We have to buy all these things. This is a hard County to live in. I'll have to move out West." And so it goes.

It has been a matter of regret to me that at these Farmers' Meetings in Fredericton, for the past two years very little time or attention has been given to the subject—(important above all others to the farmer) viz. Soil Cultivation, and the Growing of Crops. Is this subject to be sidetracked again this year? It would almost seem so from the programme.

In the County of Queens the one thing that has most hindered the advancement and prosperity of the place has been the failure to properly cultivate the land. I do not mean simply that most of the land has never been cleared, but the farms that have been cleared are not half cultivated.

I am quite confident, from my own experience, that at least double what is now grown on all the farms in the parish of Chipman could easily be produced on the same acreage, with more thorough cultivation and rotation of crops. Until we get something that will stimulate us to give our land more thorough cultivation and grow something to sell and a better quality of feed for our stock, we cannot look for much improvement, and we'll have to swallow the statement made at a public meeting a short time ago, that "there are very few good farmers in New Brunswick." The meeting referred to had for its object the development of New Brunswick by importing not stock—but practical farmers—a good idea—but is there no hope of improvement among ourselves?

We hear the note: "Back to the land" sounded occasionally by those who have tired of other professions. Let the farmer who has been disappointed in his pure-bred stock, who has failed to make them pay, because kept in a half starved condition or kept up by buying feed at $30.00 per ton, take the hint and get "back to the land" and grow for feed: clover and turnips, which he easily can do—and corn and alfalfa if he can, and a patch of strawberries to bring in $100.00 or more in July, and a couple of acres of potatoes extra for sale. The potatoes can be grown on poor land, well cultivated, and with the application of one-half ton of good fertilizer to the acre. This has been my experience at least.

I believe that our Local Government, our Public Meetings, and our Agricultural Papers give undue prominence to Pure-bred Stock. Something is wrong or the statement could not be made—as it was made in the Farmers' and Dairymen's Meeting here last winter, and made without contradiction—that New Brunswick had more cattle and better cattle thirty years ago than it has today.

I believe the remedy for this is mainly a problem for each farmer to work out for himself; but ought we not to expect our Agricultural Papers, our Public Speakers and above all our Government—(those who are at a sufficient distance from the Cow to get a square view of the situation), to locate the cause of the comparative failure of the dairy industry in New Brunswick. If it is mainly because we do not grow the feed—feed which our land and our climate are well adapted to grow—then we need our attention turned in that direction.

A stimulant is a dangerous thing, but there are times when it is a necessity, and I believe the Dairy Farmer needs a dose now—one strong enough to set the machinery in motion the first of May and put to the test the statement: "He that soweth bountifully shall reap also bountifully."

One other matter and I am through—The price of Horses at the present time stirs us to enquire—why are not more good colts raised by farmers? In the Chipman section of Queens County there are a large number of fine mares, mainly of Clydesdale breeding, weighing from 12 cwt. to 15 cwt. Why don't we raise colts? I'll tell you. We have no good stallion in the place. Occasionally one comes along from some other section with the result that might be expected. The man who has a mare to breed generally misses the chance.

The price of a good stallion and the cost of keeping him the year round is such as to put it beyond the ability of a small Agricultural Society to handle. The society which existed in Chipman some years ago, was broken up by the purchase of a horse. Our Society is at present trying to interest some private parties to purchase a good Clyde. stallion, the society to guarantee patronage and a bonus such as its finances will admit. We are met with—"It is not likely to pay us for the outlay and risk. It does not appeal to us." What are we to do? One of two things—do without or get one with the assistance of the Government. If I am rightly informed, the Dominion Government gives a bonus of $250.00 a year to anyone keeping for service a stallion of the breed known as "Thoroughbred." As I understand it this bonus applies only to that breed. If we thought that was the best kind of horse for us we could get a stallion and draw that bonus. We believe that the Clyde. is the best for us either to work or to sell. In all fairness, we should have a like bonus. There are several reasons why we should have it. I will just mention two or three. First, we need it because we cannot get started right without help. Second, it would enable the owner of the horse to put the fee down to say, $10.00. Third, it would give the Agricultural Society a chance to make some arrangement with the owner of the horse and thereby ensuring his being kept in a certain district. Will our Government not assist us in this matter? Let us try them by passing a resolution at this meeting asking them to do so.—Isaac W. Baird.

RESTIGOUCHE COUNTY.

The spring of 1911 came in early, dry and warm. Nearly all the seeding was done in May.

The month of June was very wet.

The hay crop was the heaviest and best ever known.

The wheat crop was below the average, but not very extensively sown on account of no proper mill for grinding.

(Continued on page 500).

Good and Bad Features in Horse Collars

Good Collars, Careful Grooming and Attention to Details Lessen the Risk Occasioned by Sore Shoulders.

By R. J. Currie, Horse Collar Specialist, St. John, N. B.

"No foot no horse" is an adage with which every farmer and horse handler agrees. Next in importance to the foot and a healthy, normal body is a good shoulder and many good horses have been practically ruined by the neglect of their grooms and the use of impractical, ill-fitting, dirty collars.

The horse's shoulders should be kept scrupulously clean by thorough grooming so that all loose hair and dry sweat will be brushed off before the collar is put on and care should be taken that the bearing surface of the collar is scrupulously clean. It takes a horse's shoulder a long time to heal, so prevention is better than cure. A horse with sore shoulders endures a lot of agony and is often forced to do a lot of heavy work with the main part of the draft on an injured spot, and if not relieved the animal soon loses flesh, and may cause a sound animal to become balky.

To assure sound shoulders the collar should be well made and well fitted and as already stated it should be kept scrupulously clean by thoroughly rubbing to eradicate any accumulations of sweat as soon as it is taken off the horse. Wash the dried sweat off the collar at night, and bathe the shoulders with cold water after the horse is unharnessed.

The first symptom of a sore shoulder is that the hair stands erect in the location of the injury. Later, if the animal is continued at work with the same kind of collar, the skin and hair slough, leaving a raw, bleeding surface. The size of the sore may be from that of a silver dollar up to three inches in diameter.

Many times a soft swelling appears just above the point of the shoulder. If opened at the outset, a straw-colored liquid escapes. On the other hand, if not molested it becomes infected and an abscess forms.

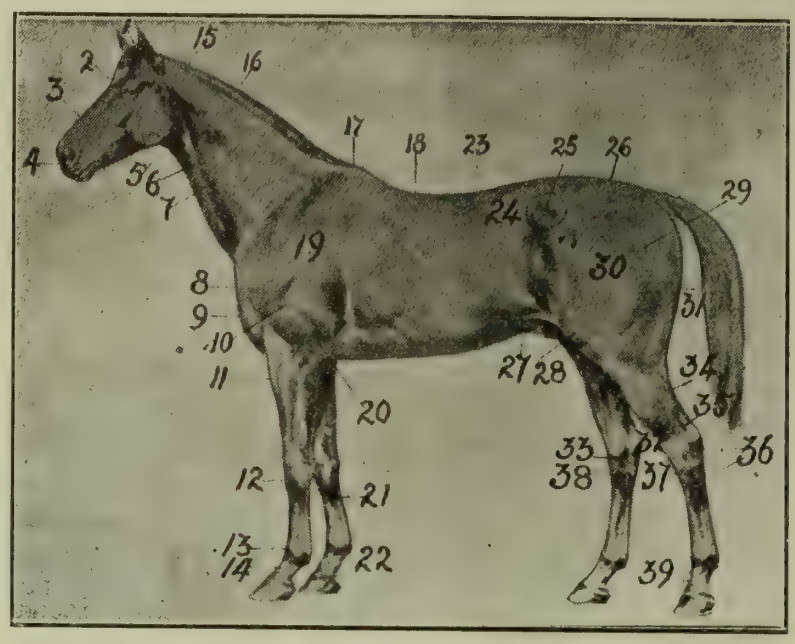
These abscesses are often superficial, but may be deeply seated and require expert attention. The deep abscesses may be located six inches or more below the surface of the skin, between the shoulder joint and the chest wall. These abscesses often prove serious and should only be treated by a qualified veterinarian.

Some men are great believers in the use of sweat collars; to others their use is an abomination as they retain moisture from sweat or rain, and being constantly in touch with the horse's shoulders in the wet state they very soon harden and an irritation sets in.

In the manufacture of horse collars good quality of the stock used is of primary importance. The rim should be strong and well stuffed into shape. The body of the collar is most important and here it is where some of the most skilled workmen fail in their attempt to produce an ideal collar. The body of the collar should be made in such a way that it will have a level bearing on the horse's neck from the top down to the point of the shoulder then slacking off to allow the point of the shoulder to work easily without interferring with the motion of the horse. A great many collars are made too full at the point of the shoulder and as a consequence a sore develops at this point.

The manufacturer must also look after the style and finish of the collar for if it is wrongly cased it will always be an eyesore for the lack of proper filling and smoothing.

Many collars are made too light in the top and too full on the draught. A collar of this kind will rock on the horse's neck and when hauling will either pull back on top or down on the shoulder points.



Key To Chart of Horse.

1, Poll, Seat of "Poll evil" 2, Forehead; 3, Face; 4, Muzzle; 5, Throatlash; 6, Windpipe; 7, Jugular Groove; 8, Point of shoulder; 9, Chest; 10, Arm, from shoulder point to elbow; 11, Forearm; 12, Knee; 13, Fetlock; 14, Pastern; 15, Neck; 16, Crest; 17, Withers; 18, Back; 19, Shoulder; 20, Elbow; 21, Seat of splint; 22, Seat of Sidebone. Quarter-crack indicated below; 23, Loins; 24, Coupling; 25, Hip; 26, Croup; 27, Flank; 28, Stifle; 29, Hip joint; 30, Thigh; 31, Quarter; 32, Point of Hock; 33, Hock joint; 34, Gaskin or lower thigh; 35, Seat of thoro' pin; 36, Seat of curb; 37, Seat of bog spavin; 38, Bone spavin; 39, Seat of ringbone.

The idea that a hard collar with a sweat collar under it is the proper kind of collar to use is a great error from a practical standpoint. Every experienced collar-maker knows and will admit that a collar for heavy work should have a soft facing so there will be some give to it.

All horses' necks are not shaped alike and consequently each horse should have his own collar. It is a mistake to use one horse's collar on another horse as it destroys the conformation of a collar and its adaptability to the proper horse's shoulders.

In the United States they have tried pulp collars, and sheet iron collars and they all have their failings which prove that no hard substance is suitable for the manufacture of collars.

Pneumatic collars have also been manufactured and they too have met the fate of the impractical. They were made with a rubber tube inside the leather casing and pumped full of air from the top. The oily nature of the leather covering of the collar soon rotted the rubber air tube inside and, as the air compartments in the sides were not connected, one side would frequently get soft, and, as a consequence, it was only a question of a short time until the horse would have to contend with a side draught and be obliged to haul his load by one shoulder. A great many of these pneumatic collars had to be stuffed with some other material before being placed on the market.

The short straw, machine made collar is also a failure to a certain extent as they are mostly made of short straw and whenever a break is made in the casing the stuffing drops out and the collar is ruined. Beside this many of the short straw collars have no facing to protect the horse's shoulders but the hard cut up straw.

The proper filling for a collar is a good hair facing. Moose hair makes a splendid facing for a leather-faced collar. It does not, however, do so well for a cloth-faced collar as the sweat works through the cloth and hardens the hair. The proper facing for a cloth-faced collar is curled hair, which manufacturers and teamsters know is the most durable material that can be used for this purpose. These hair facings are used in the manufacture of long rye straw packed collars, which makes a strong and durable collar with a soft, pliable face that conforms readily to the horse's shoulders.

A long straw collar being uniformly stuffed by hand and made to shape will always retain its shape. Short straw collars are only blocked or pressed into shape and very soon become a shapeless piece of harness.

There are a great many different styles of collars: The sweeney collar, the hard and soft pipe collars, etc., which are very largely stocked by retailers. The sweeney collar is uncalled for and of no benefit whatever to a horse that has good shoulders. It is made expressly for horses that have sweeneyed shoulders, caused by a strain in hauling or repeated bruisings by ill-fitting collars. In cases of this kind the top of the shoulder blades become very prominent and caloused lumps may form on the shoulders. The sweeney collar is narrowed opposite to where the lumps occur to allow the collar to set on the horse's neck without interferring with the lumps.

The pipe collar is also made for a purpose. Perhaps a great many of the readers of the Maritime Farmer have never seen pipe collars and consequently do not know what they are. The pipe collar is made to a point at the throat and runs straight to angles at the point of draught. A piece of iron piping in the rim of the collar helps it to maintain this shape. The pipe collar is used on horses that have prominent wind-pipes and that are chicken-breasted or have prominent breast bones. In cases of this kind the ordinary collar presses too hard on the wind-pipe and sometimes on the breast bone and irritation and sores result. With the pipe collar, the angular shape at the throat makes ample room for conditions of neck and breast as indicated above, without bringing the draught too low. A great many people think that when a collar is choking their horse that they should buy a pipe collar but the choking is from a different cause.

The reason why a collar pulls up on a horse is because it has not enough top to balance it properly and is in all probability much too wide and the longer the collar that is put on the more it will choke the horse. Some horses require their collars much heavier in the top than others as the shoulders slope back much more in some horses than others.

A horse that is worked in a tip cart should have a collar that is good and heavy at the top as the draught is usually high and the tendency is to pull the collar up and backwards at the top.

The soft pipe collar is the same as the hard pipe collar only it has no iron piping to keep its angles in shape and is used for the same purpose as the hard pipe collar.

A great many sore necks and shoulders are caused by not having the collar snugly buckled on top and by having the hames too slack. You will frequently find teamsters that will let out the top strap of the hames so far as to give them so wide spread on the top that the collar is allowed to widen out and roll and slip on the neck. This is a piece of neglect for which there is no excuse.

When the collar is first put on, it should fit the horse close to the inside of the neck, bearing the whole way from the draught to the top. The driver should see that the hames are put on with the draught coming at the proper place and have them buckled snugly into the hame room of the collar by drawing them up as tightly as possible. After the horse hauls into the collar for a day or two, the top strap of the hames will require adjusting so that the collar will be kept in close to the horse's shoulders. In fitting a horse the collar should be one inch longer than the measurement of the neck when the collar is shoved back on the collar seat and fitting closely to the neck.

The collar should have a heavy enough rim to prevent the hames from slipping off.

The most durable facing for a collar is grain leather. Not infrequently manufacturers use sheep skin leather for this purpose but it is not at all durable.

The hand sewn collar is also much more durable than the machine sewn collar and the little extra cost at time of purchase will more than repay the purchaser in extra durability.

Editor's Note:— Mr. Currie is a practical collar manufacturer. He has been engaged in the business for about twenty years and as he learned his trade with and was associated with the foremost collar manufacturer in Eastern Canada, the ideas gleaned from his former employer and his own personal experience puts him in a class by himself as a collar manufacturer. See his ad. on another page of this issue.

How I Make a Profit With Sheep.

By Mathew Lamont, Yarmouth Co., N. S.

Awarded First Prize in the Maritime Farmer Sheep Raising Contest.

IT was among the hills of Scotland, while tending my father's flock, that I first heard of the suitability of these Maritime Provinces, and especially Nova Scotia, for raising sheep successfully.

It was not of much use for the young farmer and stock raiser in Great Britain to look around the land of his birth, with its limited area all utilized to the utmost, for an outlet for his energies.

Australia and especially New Zealand, though far distant, were attracting a good many; but the former, with its immense stretches and flocks in thousands, needs quite a capitalist to handle a commercial flock, and the latter, at that time, seemed to be having a period of depression. Although there was not one-quarter so many sheep there then that there is now, yet there was no satisfactory outlet for the muttom. The Statesmen that have been at the helm there, for the past fifteen years or more, had not then come to the front with the freezing and freight-subsidizing solutions for her difficulties. Her wool and surplus mutton from some twenty-five million sheep now fetch good prices on the British market and those distant islands have become the safest and most profitable part of the world in which to keep a flock of sheep.

At that time the Provincial authorities in Nova Scotia had a handbook circulating among the farmers in Scotland showing how easy it was to own and equip a farm in that Province for sheep raising and that a fortune was awaiting anyone with some knowledge of the business and sufficient capital to make a start. So, some twenty-five years or more ago, I ventured thither, anxious to get where the winters were fairly open and the climate not much more severe than that to which I had been accustomed. I headed for the South Western Counties and eventually secured some 300 acres of land, near Short Beach, in Yarmouth County, where I still abide.

This farm seemed well adapted for sheep; plenty of dry, ridgey land with short rich grass on it, while the northern end of it, 100 acres or so, resembled the moorlands on which our well known Black-faced sheep get a living. It is true this moorland is not covered with heather like the Scottish, but it has a kind of a heath composed of crowberry, cranberry, blueberry and other vines and the wild cotton, an excellent spring bite for sheep, grew abunhantly on sections of it. The buildings on this place were poor and the fences not much better and I was out some $5.00 per acre for the land. No one had lived on the place for a good many years but the mowings and pastures, cranberry bogs and woodland brought in a good rate of interest on the investment. It was bounded by the seashore, for a mile, on the westward; and a lake shore on the southward; but a public road running through the place for a mile made a good deal of fencing necessary. I had quite a few fields on the south end of the farm, near the lake, that had been cultivated some and were enclosed by a low stone wall—too low to make a satisfactory fence for sheep.

It was early summer when I took possession of the farm and I spent the most of the first season fixing up buildings and fences, securing the hay and tending a few crops. I let the cattle run in my pastures that season and towards fall commenced to gather up all the ewes and ewe lambs I could get. I got one small flock of pure-bred Shropshire ewes and a ram. Before winter was over I had bought up, from far and near, 98 head. I had plenty of hay for them, that was hardly saleable, although of good quality, and some turnips. My records of that year show that I saved 93 lambs in the spring of 1886 from this flock. Some of the yearlings had lambs, but there were very few of the flock raising twins. I kept them around the mowings till they had their lambs and then I spread them over the pastures and did not get them sheared until June. I stubwashed the wool, dried it and found I had no less than 418 pounds for sale.

I Need You and You Need Me.

Do your part by bocoming a member of the Maritime Sheep Breeder's Association and working for the protection of the industry I represent. Mr. J. A. Telfer, the gentleman who is posing me, is Secretary of the Maritime Sheep Breeder's Association; he will be glad to get your application for membership. Mr. Lamont has had trying experiences. Cannot matters of this kind be alleviated by concerted effor on the part of the Maritime Sheep Breeders.

The market for wool was better then than now. Every country family and fisherman's household wanted quite a few pounds of wool to make into stockings, mittens, etc. There were double the sheep kept around then that there is now but not enough to supply the demand for wool. The best wool brought 40 cents per pound and inferior wool 5 cents to 10 cents less.

The demand for lamb was also very lively; almost every household then used lamb during the summer months. The butchers were around by the end of June for 12 of my March lambs paying me $3.00 each for them. Such lambs the past few years would bring more than double that money. During July I sold 28 lambs at $2.75 each; in August 32 lambs were sold at $2.50 each and the balance (14) in September at $2.25 each. This left me with 7 of my best ewe lambs to add to my flock, leaving me with 105 ewes and 1 ram. Five of these ewes, not being up to the mark, I fattened up a little on fall feed and turnips and got $3.00 each from them by the end of the year.

I am giving these details so that readers can compare them with present prices. It is evident that if there was money in raising sheep then, there must be much more in it now, if there is not at the same time a good deal more risk and expense connected with the business.

The following figures show what I got out of my flock in the year 1886:

It cost me to buy my flock,	$348.00
Hay, roots, dip and fencing...	54.00
Hire of extra ram.....	1.00
Total.....	$403.00
SALES	
240 lbs. wool @ 40 cents.....	$ 96.00
178 lbs. wool @ 35 cents.....	62.30
86 lambs realized.....	224.50
5 fat ewes @ $3.00.....	15.00
Gain in value of flock by the lambs added.....	15.00
	$412.80

Thus a flock of sheep after being wintered and fenced, costing some $400.00 had returned more than they cost and I still had that flock readier than before for another year's business. I felt well satisfied with the year's returns and the prospects for the future.

FENCING, ETC.

The problem of fencing is one that every sheep raiser has to face. Good straight spruce poles that sawed up into 3 or 4 strips, I found to be cheapest and most satisfactory; first, because I had them growing on the farm and second, because the saw mill was handy. I found that 2 boards with a wire between made a good fence for turning sheep; but if the ground was very uneven it required a barbed wire underneath also, with another barbed wire on top you have a fence that will turn stock of any kind. I have seen small sized dogs and foxes turn aside rather than take such a fence. A fence like this well put up with spruce or tamarac stakes will last 15 or 20 years or more. It will want some fresh stakes but that is not much of a tax to find every 8 or 10 years. Barbed wire would not make a suitable fence for sheep by itself, but mixed in with boards the barbs do little harm to the fleece of the sheep. Also when more than 2 board rails are put on a fence it catches too much wind and it is very hard on the stakes.

WINTER FEED.

After fencing, the next problem for the sheepman is the winter feed for his flock. To the shepherd from Scotland, where the winters are comparatively mild, and large flocks are carried with little provision through the winter, this seems, at first, quite a difficult job. A few years of experience soon simplifies the problem for each of us. I had a great deal of old mowings that were not yielding much hay so I turned over 2 acres of them for oats and another for turnips, to help to provide feed for my hundred sheep during my second winter in the sheep business. The sheep manure composted with kelp and the manure from the oxen also heavily composted were spread evenly over this ground and worked in with the harrow. The turnip ground had also some $10.00 worth of bone and superphosphate spread over it and well harrowed in. Then the rows were drawn out, evened off and the seed drilled in about the middle of June. In a few days they are ready to thin out and it is an easy process, if you tackle the job before they get much growth. Then they need going through with the horse cultivator a few times and I always expect a pretty good crop ready to pull and put away before the middle of November.

In raising oats for feeding to stock of any kind, especially sheep, I sow 4 bushels to the acre. They will come up very thick and fine and if the land is in good heart will grow quite tall. If the weather is fine I commence cutting them as soon as they are fully headed out. They need a lot more making than hay and are best kept in cock for a week before putting in the barn. The cocks, of course, should be turned over occasionally. My first experience here was in 1886 with this crop and I put in the barn nearly 8 tons from two acres. This was very cheaply raised feed but it proved rather wasteful for sheep so I got a straw cutter and fed it cut. I have another method of getting inexpensive wintering for sheep which I will mention. A great deal of my sheep and cow pasture is old mowing, in which the June grass and daisies come up quicker than they can be fed off. I go over this with the mower before it gets tough and gather it up with the horse rake. Some years I secure quite a few tons of it. The sheep are fond of this during the winter months and it is quite nourishing. I generally mix in a few handfuls of coarse salt with it when putting it on the mow and it is quite appreciated. A pound of this kind of hay in the morning and another pound at night for each sheep with two or three pounds of turnips and a run outside during the day will carry a small sized sheep like the South Down or Cheviot along in very good shape.

WINTERING THE FLOCK.

Sheep must have plenty of room and light in their winter quarters, and plenty af air too, but it must be overhead. My barn was only 30 feet by 30 feet and there was not floor space enough for 100 sheep, so I got a shed put up 15 feet wide along one end of the barn. Wool was quite an object in keeping a flock at that time, so I was very careful in constructing my racks to keep straws and seeds from the fleeces of the flock. I believe sheep do best where they have lots of exercise, during the finest part of the day, in the winter time.

When the snow is not deep and the wind not too bitter my flock are apt to find their way to the beach where there is usually fresh supplies of dulce and sea-weed piled in. However

(Continued on page 485).

The Hill Grove Farm Ayrshire Herd.

Dispersion Takes Place on May First.

WE had the pleasure a few days ago of visiting Hill Grove Farm, the home of one of the finest herds of Ayrshire Cattle in Eastern Canada.

Hill Grove Farm is situated in East St. John, about ten minutes walk from the street car line at Haymarket Square.

A great boom, in the way of dry docks and other harbor improvements has come to St. John and consequently land values in sections bordering on the tide waters, where the proposed works are to take place, have increased very materially in value. Speculators are anxious to buy every foot of land that has a water frontage with a view of dividing the various blocks into building lots.

As the Hill Grove Farm occupied a commanding position on the shores of Courtenay Bay, Messrs. James Barrett & Sons, the proprietors of said farm, were approached with a tempting offer for their property and after due consideration they decided to sell. The major portion of Hill Grove Farm is now owned by the Eastern Terminal Realty Company and is being sub-divided into what is now known as the Bay View Lots.

Owing to the fact that they have disposed of their farm and that they must vacate it to the new owners early in May, Messrs. Barrett are obliged to disperse their magnificent herd of pure-bred Ayrshires. They do this almost reluctantly as each and every member of the firm is a lover of good stock and to them the ideal cow is the Ayrshire every time.

The dispersion sale will take place on Wednesday, May First, commencing at 10.30 o'clock a. m., when auctioneer, Jas. A. Telfer will wield the hammer and each and every animal in the herd will go without reserve to the highest bidder.

As the proprietors of Hill Grove Farm have operated an extensive milk route in the City of St. John, for a great many years, one of the primary aims in view when founding their splendid herd, was to establish it with bulls, cows and heifers of high producing quality. After keeping grade cattle for many years they came to the conclusion that it would not cost any more, in proportion to the returns, to keep pure-breds than it would to keep grades and as a large flow of milk testing a fair percentage of butter fat was what they required to keep up their city trade, they systematically followed a rigorous system of weeding.

The grades have gradually been supplanted by pure-breds until we find no fewer than twenty-nine head—24 females and 5 bulls—catalogued for the sale.

Despite the rigors of the long, cold winter that we have just passed through, a visit to the Hill Grove stables will convince the visitor that Messrs. Barrett are good stockmen and that the appetites and comfort of their animals are well looked after. The cows are clean, sleek and fat. The capacious udders, with large well placed teats show that the various cows do not belong to the "robber" class; they give every indication of being good producers. While producing quality has been the first consideration in establishing the herd, the Hill Grove Ayrshires have not been neglected in regard to show ring qualities and they more than held their own, in keen competition, with the best herds in the Maritime Provinces and some of the leading Quebec herds at the big Dominion Exhibition at St. John, in 1910.

All the Hill Grove Farm milk is requited for the city trade and consequently Messrs. Barrett have found it impossible to take their herd away to any exhibition other than that held in the vicinity of St. John, and are therefore not so well known to our readers as they might otherwise be.

Hill Grove White Heather.

Owned by James Barrett & Sons, East St. John, N. B.

Reda of Maplehurst.

Owned by James Barrett & Sons, East St. John, N. B.

Among the richly bred animals that we saw in their stables is the bull, Cherry Bank Sunrise and as a glance at his get, in adjoining stalls, indicate he is certainly showing his worth as a sire of typical, breedy looking stock. Some of the younger things all from good dams, are beauties, of good size, perfect in type, true color and possessing strong dairy conformation. The yearling heifers would hold their own in any company. Cherry Bank Sunrise is a son of America's champion Ayrshire bull, Barcheskie Kings Own, which was imported in 1905 by Mr. R. R. Ness, Howick, Que., who is America's greatest breeder and importer of Ayrshires. Barcheskie Kings Own has never been defeated in any show ring either in Scotland as a yearling or in America since he was a two-year-old. He also has a great number of daughters that are not only show cows of a high order but also good enough producers to qualify them with good margins for the Canadian Records of Merit. The dam of Cherry Bank Sunrise is the grand imported Pansy 5th of Carston, a cow of rich breeding and a prize winner in Scotland as well as in Canada and as a persistent producer has made a daily record of upwards of sixty pounds milk on grass alone. With this rich breeding behind him, and the quality of his get, Cherry Bank Sunrise is the right kind of a bull to head any herd where improvement is desired.

Another grandly bred bull is Springhill Prince. This grand yearling was bred by Robert Hunter & Sons, Maxwell, Ontario and was selected by the Messrs. Barrett at the great Hunter dispersion sale last June, to head their young herd and eventually take the place of Cherry Bank Sunrise. His sire is the imported Lessnessock Durward Lily, also a great Canadian winner and a champion at many shows; his dam was Blossom 3rd of Bargenock, the highest official record cow in Scotland. The dam of Springhill Prince, Susan of G. F. has a record of 11,000 pounds milk testing 3.9 per cent. fat. With such grand dairy breeding behind him, Springhill Prince will surely prove a valuable sire.

The cows offered for sale include: The fine, imported, young cow, Southwick Kate, of large size, splendid type and grand quality that will undoubtedly make a great record as a producer. She dropped her first calf on January 25, 1911 and has milked up to forty pounds testing 4.1 per cent. butter fat per day. She is due to freshen again on August 15th, in good season for the fall shows. She should have a grand future as a breeder as well as a producer.

Scottie of Stockwood also is worthy of special mention. She won second prize as three-year-old in milk and also second prize in the corresponding Canadian bred class at the Dominion Exhibition, at St. John in 1910. She is a large, strong cow and a good producer. Her dam was Lily of Kelso, first in the Canadian bred class at Ottawa and Sherbrooke in 1909. She is due to freshen in August, for the fall shows.

Two other grand, good cows are Maggie of Silver Falls and her half sister Pearl of Silver Falls. As yearlings they were respectively first prize senior and first prize junior yearlings at the 1908 St. John Exhibition. Pearl was also second prize three-year-old in the dry cow class at the 1910 Dominion Exhibition. These are a fine pair of cows. They have varied very little in their daily milk flow which tests 3.35 per cent. fat, since they calved in September and October.

Another cow that we must not forget is the richly bred three-year-old, Lady Mary Stuart. This cow won second as a two-year-old heifer at the great Ormstown Quebec Fair, held on May 24th and 25th, 1911, which was one af the greatest shows of Ayrshire cattle ever held in America. She freshened with first calf in August 1911 and her heifer calf is in the sale. She is due again to freshen in August and will make a strong three-year-old for the fall shows, when she will be a hard cow to beat.

There are a number of other splendid young cows in this sale, all heavy milkers and high testers that have only to be seen to be admired.

In yearlings there is, Hill Grove White Heather. She is by Cherry Bank Sunrise and out of Pearl of Silver Falls. She is a beauty from head to tail, about perfect in every particular and undoubtedly will make a grand producer as well as a high class show animal. She will be a great yearling for the fall shows.

Then there is Hill Grove Lily, Hill Grove Maggie and Hill Grove Dairy Queen, a bunch of yearlings from which any judge would have a hard job to pick out his choice for first place.

Another yearling that is far above the ordinary is Reda of Maplehurst. She is out of the Record of Performance herd of Victor Begg, of Ontario. She is indeed a model of Ayrshire type and beauty, and was a winner at the great Ormstown, Quebec, show in May 1911. She is about as near perfect in every way as we generally get them and will make a flyer for the fall shows.

There are also a number of heifer and bull calves, of the best breeding and that are sure, with fairly good care, to give a satisfactory account of themselves whereber their new of themselves wherever their new

The pluck and energy that the Messrs. Barrett have displayed in the upbuilding of their herd also characterizes the manner in which they are planning to conduct their sale. Teams will meet intending purchasers at Haymarket Square, St. John, and will convey them to Hill Grove Farm. The stock is already catalogued and any interested parties would do well to send for a copy right away. Luncheon will be served at 12.30 o'clock p. m., so that intending purchasers may remain on the grounds until the last animal is sold.

The Canadian Farmer--His Past, Present and Future

"This is the forest primeval. The murming pines and the hemlocks. Bearded with moss and in garments green, indistinct in the twilight. Stand like Druids of eld with voices sad and prophetic."

By W. S. Poole, St. Stephen, N. B.

MANY years ago when the cities of the Maritime Provinces, as well as Quebec and Ontario, were first settled, hardy pioneers pushed their way back into the forest (that, until then had not been touched by the axe of the woodsman) and started to cut from the virgin forest a home for the maintenance of their families. From the first, in some parts of the Country the settlers were harassed by Indians, who did not want the white man in what he thought his country. They would ambush and kill the settlers while at work in their fields, kill or take into captivity their wives and little ones, and burn their homes. Whole settlements were sometimes anninilated and their live stock driven off or killed. The farmers never knew at what time the Indians might make a raid on them, and for their protection they carried their rifles with them when going to their work in the fields. Did these men give up in the face of such discouragement? No, they organized for their defence. Soldiers from the different forts and stations assisted them in driving the Indians back, many on both sides being killed and wounded in fights, but the settlers triumphed in the end and the Indians were compelled to submit to terms of peace, and were given land on which to live and beyond which they must not stray. One after another the hardiest and most venturesome of these strong men, took up an area of woodland sufficiently large to make a good farm when cleared, leaving enough uncleared to furnish them with fuel. As the land was taken up, the settler kept pressing his way back into the almost impenetrable forest, until settlements were being cleared from ten to fifty miles from the places which are now the cities, and from whence they obtained what provisions they had to buy. The roads were simply foot paths from one farm to another. Horses were few and far between, oxen being used for the work of clearing the land. Houses were built of the logs as they were cut in the clearing process, barns were put up in the same way.

The brush was burned as the land was cleared, and the ashes being rich in potash made a valuable fertilizer. As fast as an acre or two was cleared and burned over, it was put in crop of a kind most necessary to their use at the time, grain of some kinds, potatoes and other vegetables. Their stock of cattle, sheep and swine were increased as their farms grew in productiveness. The first crops were put in among the stumps of the trees that had been cut. A hand hoe being used for this work. Only those who have tried this way of putting in a crop of grain or potatoes, have any idea of the amount of work it entails.

In marketing their produce such as butter and eggs, the women often walked with a load to the nearest market sometimes 30 miles or more away, make the trip in one day, and return home the next, with a sack of flour on her shoulder and other household necessities besides. Their butter and eggs sold for a comparatively low price, while they had to pay high prices for what they got in exchange. I may remark right here that the cities have had the fixing of prices of farm produce almost altogether from that time to the present, the farmer himself, and the law of supply, and demand, having very little to do with the prices, so far as concerned the farmer's pocket; and it was largely this condition that made of him more a beast of burden than a man with the stamp of God's recognition on him. He lost for a time in a measure, his birthright, he allowed other men to tell him what he ought to do, and to fix the prices he was to receive for his produce. He was under that yoke for a long time, and in some parts of the country he is still under it to acertain extent, but he is getting his eyes opened and the scales are beginning to drop from them.

But to return to my story: The hardships endured by our pioneer forefathers were not all confined to Indians, and hard work. Wolves and other wild animals devestated their flocks, and constant vigilance on their part was the price of safety. But the dark days of the past were almost over. Large towns and cities were springing up, railways were being built, broad farms and fertile valleys, with large flocks and herds met the gaze on every hand.

Dairymaid of Pinehurst 24656 Adv. R. 843.

Her Remarkable Record as a Dairy Cow.

Year's record as a two-year-old, 7913.50 lbs. milk; 405.51 lbs. butter fat; Year's record as a three-year-old, 14562.40 lbs. milk 860.26 lbs. butter fat. The highest public record for a three-year-old of any dairy cow, and was also the winner of the Iowa State; Dairy Cow Contest. Year's record as a four-and-one-half-year-old, 17285.30 lbs. milk 910.67 lbs. butter fat. Average of her three consecutive years' records, 13253.73 lbs. milk, and 725.48 lbs. butter fat. See page 513

Bred by Mrs. E. W. Strawbridge, Moorestown, N. J. Owned by W. W. Marsh, Waterloo, Iowa. Cut by courtesy Guerns y Breeders' Journal.

Machinery was being invented and manufactured for the tilling of the soil and the planting and harvesting of crops. The steady going old oxen were being replaced by the noble horse. The old ox cart, by the more modern truck for work, and the carriage for driving. Instruments of music were being placed in the homes, good schools were being built, education being recognized as a necessity second only to the food problem.

What progress the farmer is making! the clouds of discouragement and despair, are about to be dispelled, one is seen with a silver lining, it grows brighter and brighter, until at last the sun bursts through, the past is rolled back, and the Canadian Farmer stands triumphant, and rejoicing, in the present. A monument to his courage and heroic self sacrifice.

THE PRESENT.

The farmer has left the woods. He is out in the open now. The past has imparted to him that courage and tenacity of purpose born of long years of adversity. He is beginning to see that he has a goodly heritage in this country of vast possibilities. He is pressing forward to take advantage of the opportunities that surround him. He wants his share of the good things, which others have enjoyed for a long time, and which have been denied him. He is going to have some of them now. In fact when he looks around over this country of abounding prosperity and realizes that it is due in a large measure to his industry, he thinks he is entitled to some recognition, and to at least share in the general prosperity. The present day progressive farmer is a whole College faculty rolled into one man. He is more or less of a chemist, an entomologist, a botanist, a horticulturist, and a veterinary surgeon, he is all these combined, plus quite a lot. And he should have written after his signature the degrees: M.S. and E.M. T., the M.S. for Master of Sciences and the E. M.T. for Earned My Title.

Mr. Farmer is getting to be a power in this land of ours. You have often heard people remark of some strong animal like the horse. "If he only knew how strong he is he would not let man control him so easily." That is the way with the farmer, he has not realized his great strength until quite recently, even now he underestimates his capacity as a force in the development of Canada. Others have felt it before the farmer himself was aware of his strength. Farmers of this country put aside party politics, and unite for your advancement and progress, and all you desire you can have. To use a slang expression, "It is up to you now."

Agriculture is being recognized all over the civilized world as the pivot on which every other industry hinges. Governments are spending more on their departments of Agriculture every year. From the Atlantic to the Pacific are a chain of Experimental Farms, Agricultural Colleges, and Exhibition Buildings that are a credit to the country and of which we are justly proud. Large factories manufacturing farm machinery are working to their utmost capacity to provide the farmer with the machines and implements he demands for his up-to-date farm. Other factories are making his fences, where thousands of miles of wire are woven, ready for the farms every year. Great cold storage plants on land and sea, are being placed at his disposal, in order that his meats, fruits, and dairy products may be kept sweet and fresh, pending their delivery to the home and foreign consumer.

Why! some factories are even manufacturing automobiles for the farmer now. Motor cars for the farmer, just pause a moment in your reading until you realize the full significance ol that short sentence.

"Motor cars for the farmer." Well of all things! But it is even so. Canada has one-half a million farms. In some parts of the country where the farmers have organized for their mutual protection and advancement, they are succeeding better than they are in New Brunswick. Some of them are getting rich, and having their motor cars delivered to them direct from the factory in car load lots. There are some New Brunswick farmers who have auto's too, and still others who could have them if they wished. I wish to impress right here tne necessity of immediate and concerted action, by the farmers of New

Our Serial Story: "Love's Barrier."

(Continued from last issue)

CHAPTER XXI.

THE PRICE.

Helen knew that they had been under his observation for some few moments before he revealed himself to them. She had never before seen such an expression on his face. It frightened her. Her breath came quickly, but she made no attempt to speak. No excuse could be attempted even if she had wished to excuse herself. Nothing could explain the fact that she was alone with Gerald Hunt in a remote part of the Mardocks Wood, except that she had met him by appointment. Realising that, she held her peace. A sinister smile was on Hunt's lips, and it was he who spoke the first word.

"Your wife and I are renewing an old acquaintance, Mr. Secretan," he said lightly. "For some reason or another she did not give me the light of her countenance last night."

Secretan did not smile.

"My bicycle broke down just outside Iffley Carr," he said to Helen. "I shall have to walk the rest of the way home. Are you ready to come now?"

"Yes," said Helen mechanically. "I am ready now."

She did not again look at Gerald Hunt, but began to walk rapidly away down the path she had come such a short time before. Secretan dismissed Gerald Hunt with a curt nod, and left him to ruminate on the two-fold disaster of the afternoon. It was a disaster that Helen, for some stupid unfathomable reason should have elected to take up such a stand; her husband's sudden appearance on the scene complicated the whole affair. He thought on the whole, however, it would be likely to help him. Secretan would stand no nonsense, and his wife would have a bad quarter of an hour with him; so much Hunt had read in the man's eyes. He grinned rather bitterly as he turned away rolling up a cigarette paper. What fools women were! was his reflection. Why couldn't Helen let well alone? She was doing no good to anybody by her behaviour. He hoped Secretan would give it to her hot enough to make her regret her stupidity, and render her willing to temporise.

Secretan followed slowly, wheeling his machine, and presently they left the woodman's gate and were out upon the open moor. Not a soul was in sight, and the glow of the clear autumn afternoon made an immensity of space about them which at the moment helped Helen. They both stood still as if with one accord, and Secretan steadied his bicycle in a rut of the uneven road.

"What does it all mean, Helen?" he asked quietly, but with a certain harshness in his voice. "For what reason had you to pretend last night that you had never met Major Hunt before?"

"I cannot explain myself, Claude. I acted on a sudden impulse which I cannot now account for."

"Have you any explanation to offer to me now, then?"

"No, none. I knew Major Hunt in the old Colchester days, and that is all."

"It will be better, perhaps, if you give me a full confidence now, Helen. It is not a pleasant thing for me to meet you in Mardocks Wood in such circumstances. My faith in you is very great, and my love is strong, but—but——"

She made him no answer. "You can't tell me anything further, then?"

"Not to-day, Claude," she said with extreme difficulty. "Don't ask me. Trust me if you can a little longer."

A View of Centerville, Carleton County, N. B., Soon to be Reached by the St. John Valley Railway.

"May I ask you just one question? You met him by appointment, of course; when and how was that appointment made?"

"Last night, at High Ridges, when I was playing the piano."

"I see; just one more. Is he the man of whom you told me that day at Colchester?"

She hesitated just a moment. Everything seemed to be slipping from her. She had never seen this cold, hard, judicial side of her husband. It continued to terrify her, simply because she loved him and feared to fall one jot or tittle in his estimation.

"I am waiting," he said quietly. "Is he the man?"

"Yes."

He lifted the machine from the rut and began to move on, dragging it as if unconsciously behind him. So they came without another word spoken to the edge of the moor, and out upon the road which led in one direction through Midcar village, and in the other way across the open country towards High Ridges and the Court Farm.

"If you don't mind, Claude," said Helen, a little hurriedly, "I will not come home just yet. I will walk on to the Court, and take tea with Jane. They will look after you at home. It will be better if we—if we have a little time apart just now."

He did not answer her, but turned in the opposite direction, and walked away much more quickly, wheeling the machine. She glanced back once at him as she took the Court Road, but he made no sign.

When she walked on again, a sob broke from her lips. Her thoughts were a blind chaos; she must have time and opportunity to arrive at some clear understanding of where she stood. When she had, after much travail of spirit, decided where her duty lay, and had set out bravely to fulfil that duty, which was to save another woman from a life of sheer misery and disappointment, she had not taken into account her own husband's possible attitude. He had been so tender, so considerate all through, that she had taken no account of his strength, nor of the darker passions which are in every man's soul, making at once his strength and his weakness. It was going to be a far more serious thing for her than she had imagined, and just for a moment she faltered. She must tell some one. She would seek her house of defence. She was not afraid of Jane's clear eyes, nor of her quiet, convincing tongue. She would never be blinded by passion, but would be able to present as well as to take the sanest view. By what Jane said, then, she would stand or fall.

A little over a mile from the spot where she parted from her husband, a stile marked the short cut through the fields to the Court Farm. Her steps hastened as she approached the house, and her eyes visibly brightened. A few minutes more, and she would be able to lay down her burden in the house of defence. She wondered, as her feet quickly crossed the green sward of the little park, whether such a strong, beautiful friendship was not, after all, a more satisfying thing than love, which could so torture the heart that gave it a home. Love, but especially man's love, was so selfish. She had imagined her own husband different; she had set him on a pinnacle above other men, and lo, he was but common clay after all, the easy prey of the passions he so often condemned! She was not quite just to him, in these first moments of her tortured perplexity, and only regretted that she had so wholly misjudged her own power over him.

The fates seemed all unkind that afternoon. The apple-cheeked damsel who answered her knock informed her that Miss Jane had gone to Bradfield for the day, taking the little boys with her. They were not expected home till eight o'clock, when a fly was to fetch them from the station.

"But won't you come in, ma'am?" said the kindly creature. "I'm just takin' in the master's tea."

At the moment, Courtney, hearing voices, appeared at the dining-room door; Helen was very tired, and in need of refreshment, but the sight of Courtney made her hesitate. She judged from the colour of his face that he had been drinking. He came forward with much show of cordiality.

"Mrs. Secretan, yus sure coom in, and they'll hurry oop th' tea. A'ave been waitin' ever so long. Ivverything goes to sixes an' sevens when sho's out."

Helen did not quite know what to do. She had no love for Tom Courtney at any time, and considered him outside the pale, even when he was sober, but her bodily fatigue pleaded for the rest and the refreshment she so badly needed. She stepped across the threshold of the door and entered the dining-room.

"Surely this Bradfield visit was rather sudden, wasn't it? I heard nothing of it on Wednesday when she was over."

"I don't know. She doesn't tell me much," he said thickly. "She's gotten verry close of late. We beant pullin' in the same boat, worse luck, Mrs. Secretan. How's th' parson, eh?"

"Quite well, thank you," said Helen, and sat down rather gingerly on the edge of the chair nearest the door. She had had no experience of men who indulged in strong drink, and was not certain whether Courtney in his present state were desirable or even safe company. Jane could have told by a glance at him that he had indulged to the extent of a glass and a half of whisky neat. "No, the parson doan't coom verry often this way," he said, as he spread his great arms across the table, and fixed her with his somewhat glassy eyes. "Nobbut doan't coom much here. Sho frightens them aal away. Woan't allow a man a pald or a glass. A'am sick ov it."

"Why not get another housekeeper, then?" said Helen spiritedly. "We should only be too glad if you would, and let her came back to the Rectory I assure you."

"Aa doan't mind, a'am sure," said Courtney, who in his cuus invariably reverted to the broadest tongue of the West Riding. "A'ave noan use for her noo, sho hass noan use fur me. We're quits."

Helen smiled in spite of herself. At the moment the little maid fetched the tea-tray, spread with its fair white cloth, and set it down in front of Mrs. Secretan, who proceeded somewhat mechanically to pour out the tea. She made sure that the cup she filled for the master of the house was good and strong, and when he had drunk it at a gulp, and pushed his cup in for more, she thought his eyes looked steadier.

"See here, Mrs. Secretan, hast tha got a'a tha wants? Mekk thysen to whoam an' let me taak. Couldn't tha do something noo fur me wi' Miss Jane? A'am fair keen on her, A'a am."

Helen shook her head.

"I'm afraid not, Mr. Courtney. Miss Jane is a very strong-minded person. She always knows her own mind, and I don't think she would like me to interfere."

"But couldn't tha noo, just fur onst? A tell tha A'am varry keen. A nivver saa sich a woman. There beant annything she can't dew, and dew weel. Sho's a marvel, an' theer's somethink aboot her that draws a man loike. A'a could get plenty ov them to coom in as missus o' the Court Farm, but they be a'a ower keen. Miss Jane she luks at a man as A'a might luk at an insect on tha window pane, that A'ave noan use fur. That's the kind a man wants, by thoonder, it is."

Helen, munching her bread and butter, wondered how Jane had been able to endure this sort af thing for so long. It was intolerable for her to sit in the room with Courtney even for these few moments.

"A'a say, Mrs. Secretan," he said, waxing more confidential, and drawing his chair round the end of the table to be nearer to her, "A'a want to tell tha something. It was goin' a'a fair an' square 'tween Miss Jane an' me afore that auld red-faced chap coom to Mardocks."

"What old red-faced chap are you talking about?"

"Why, th' noo Squire, av coorse, Sir Anthony. He's been smellin' round here off an' on for th' last fower months, and av coorse Miss Jane, sho beein' the clever woman she is, smells a rat. She thinks to be ma leddy, see. Sho's lookin' a bit higher than bein' an honest farmer's wife."

"Oh, nonsense," said Helen hastily. "You are talking pure nonsense. Let me give you another cup of tea, then I must be going. I have a long way to walk back."

"Theer be noan hurry," he said in the same low, eager tones. "Sit tha still an' gies tha crack. It's the

God's trewth A'am tellin' tha. Sho's a deep un, Miss Jane, sho's playin' her cairds sly. But A'Ave noan done wi' they yet, and if Sir Anthony put a spoke in me wheel, A'al mebbe put a spoke in his, see, Mrs. Secretan?"

Helen rose and drew her white scarf about her shoulders. She hated to hear him speak of Jane like that; it was more than discourteous, it almost seemed like sacrilege. Jane, as Lady Brede, mistress of Mardocks; what a triumph! She almost wished there might be a germ of truth in the half-drunken farmer's words.

He insisted on accompanying her nearly half a mile down the road, begging her most of the way to put in a good word for him to Jane, and waxing almost maudlin over his own loneliness, and the bitter assaults of fate against him. She was thankful to get rid of him at last, though the unexpected diversion into a totally different scheme of things had done her more good than she knew. It had lifted her for the time being clean out of the dismal and chaotic area of her own thoughts, so that when she came to it again in her solitude, she found herself amazingly saner and stronger. Of course, it would be quite easy to smooth Claude down, to assure him that all his suspicions were unworthy. On one point, however, she was determined; she would not, unless driven to it in self-defence go into that sad and sordid story, abase herself by all its details. She had told him all that was necessary that day in the Castle Gardens at Colchester, and he wodld prove himself both ungenerous and unkind to go back upon that day.

She shivered a little, however, at the thought of what Gerald Hunt might do in the way of revenge, if she pushed her resolve to its conclusion. She knew him as an unscrupulous person who would not hesitate to destroy her happiness if she should stand in his way. That happiness had become very precious to her; she had thanked God for it on her knees.

Very gradually the beauty of the Christian life, its power over conduct, its victories over self, had stolen into her heart with unforgettable appeal. She had met men and women who, instead of choosing without hesitation the path of selfish ease and enjoyment, paused as a matter of course to consider whither God would lead them. And even when the way was flinty they did not shrink from it. The spirit of the martyrs seemed to have been wafted from the earlier days, and was still a subtle and strong essence inspiring men and women to heroic deeds in homely places. She would not fall short of these; she would be in line with that high nobility of purpose.

To save Audrey, even at cost to herself, was Helen's motive; no thought of sordid revenge had touched her. So far as she herself was concerned, she would only too gladly have allowed Gerald Hunt to go his own way. She erred, perhaps, in the method, especially in her treatment of her husband. She forgot that the priest is not immune from the weaknesses and passions of common men, nay, that in some respects he may become more easily a prey to them. His sedentary life, his long hours of study and solitude, if he be a priest worthy of the name, undoubtedly conduce to introspection, to morbid dwelling upon troublous thought. He who fights in the open breathes a purer air. Helen, so ready to sacrifice herself in her new zeal for the welfare of others, forgot that her first obligation was to her own husband. Therefore disaster, misunderstanding, bitterness, was inevitable.

She felt very tranquil when she reached the village, greeting many as she passed through it with that sweet cordiality which had won them all. She had completely usurped Jane's kingdom now; "th' passon's wife" had become not only the power behind the throne,but the power upon it.

Jimmy Bates was waiting for her at the open door, a troubled expression on his cherubic face.

"Now, p'raps master will have some tea, ma'am. I made it ever so long ago, and rang the bell, then I knocked at the study door, but he's never come out to touch it."

"Hasn't he, Jimmy? And where are the children?"

"Picnicking at the Fell, ma'am; don't you remember?" he asked in surprise.

Helen did remember then, and felt relieved. The house would be very quiet. So much the better for her, and for Claude.

She passed through the hall, and tried the study door. It was locked, and she could obtain no response to her knock. She passed through the hall again, and went round to the end of the house, where the French window opened on the croquet lawn. The westering sun lay strongly there, in a beautiful golden flood. The study caught the setting sun all the year round, and was thus in the later hours of the day always a cheerful place. The blind was drawn, however, and the window closed. A sharp fear assailed her heart then, and she tapped loudly and quickly on the pane.

"Claude, open the window at once! Don't shut yourself up. I won't have it," she called in a voice of imperious sweetness. After a long moment his hand drew up the blind with a jerk.

"I am busy," he called through the pane. "I don't wish for any tea, and please do not disturb me again."

He turned his back and left her standing on the broad step. After a moment she walked slowly away.

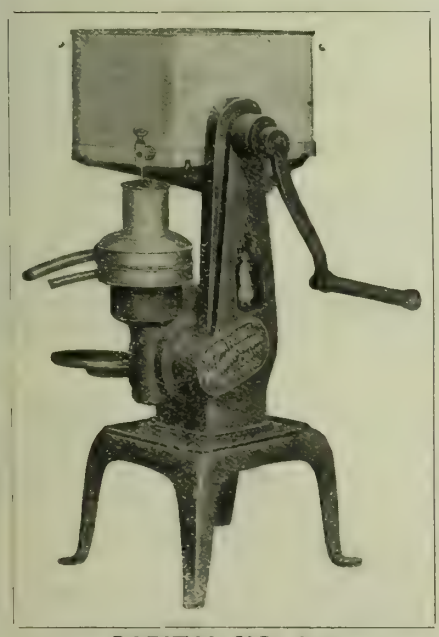
(Continued in next issue).

Don't Whine.

A recent number of 'Medical Talk' has an article on the evil physical effects of 'whining.' Complaints, says the writer, are usually made in the minor key. This monotony rasps the vocal cords, taxes nasal nerves and muscles that should not be brought into play at all in speaking, and tends to shallow, uneven breathing. The whiner, too, is almost without exception, a more or less idle, lazy person. The habit of whining itself tends to sap initiative impulse, and increases phlegmatic tendencies. Habitual whining, not healthy, vigorous fault finding where fault really exists, but the helpless, futile complaining of a narrow nature too indolent to make any effort to right the causes of complaint, has a definite deleterious physical effect upon the whole constitution. Add to this the fact that eternal fault-finding is more than likely to wear out the staunchest friendship, and take the light from the loveliest countenance, and the full effect of this insidious and prevalent habit will be better appreciated.

'Get the whine out of your voice or it will stop the development and growth of your body. It will narrow and shrink your mind. It will drive away your friends; it will make you unpopular. Quit your whining; brace up; go to work; be something; stand for something; fill your place in the universe. Instead of whining around, exciting only pity and contempt, face about and make something of yourself. Reach up to the stature of a strong, ennobling manhood, the beauty and strength of a superb womanhood. There is nothing the matter with you. Just quit your whining and go to work.—Evening Gazette.

Capital Cream Separators



CAPITAL NO. 6-8

Height of milk tank from floor, 38 inches.
Speed of crank, 55 revolutions.
All bearings on which gears run are the most improved type of ball bearings.
Instantaneous clutch—self oiling. An absolutely clean skimmer.
Capacity No. 8, 800 lbs. per hour,
Capacity No. 6, 500 lbs. per hour.

Sold Under a Guarantee and Insurance Bond

Protecting you against loss by fire or accident.

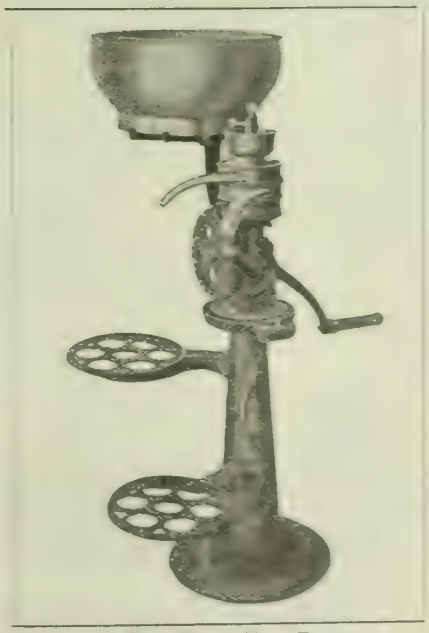
YOU ARE PROTECTED

against any loss (by fire or other damage not wilfully done) of any part or parts of the within mentioned Separator for a period of TWO YEARS from the date of purchase and the company agree to replace with new parts any part or parts that become damaaged as above described. If the Separator is totally destroyed by fire so as to be unfit for repairs the company agree to replace such separator with a new one of similar capacity on receipt of satisfactory proof that within mentioned separator was so destroyed.

The Capital Separator is made by skilled workmen from the best material we can buy and all the parts thereof are most carefully inspected before being used and they should last a long time if cared for properly and operated according to the printed instructions accompanying each separator.

If, however, notwithstanding our most careful inspection, a defective part should inadvertenly find its way into this Capital Separator we further agree for a period of FIVE YEARS from the purchase date, to replace free of charge at our Maritime Sales Office, Moncton, N. B., any part or parts that may be required to replace such defective part or parts. The purchaser agrees to return to Moncton, N. B., any defective parts replaced if so requested by the Company and to prepay charges thereon.

A postal to our nearest branch will bring you our latest Book, Turning Milk Into Money. Write for it today.



Capital No. 5

Capacity **500** lbs. per hour.
Height of milk tank from floor, 45 inches.
Speed of crank, 60 revolutions.
The easiest running separator of its capacity on the market. All bearings are made from the very best grade of phosphor bronze. Instantaneous clutch. All gears stop when handle is dropped.

THE Sussex Manufac ing Company line the best in their c on the market toc You will see by the cuts the catalogue which we wo like to send you that we h made many valuable and tensive improvements and h added to our lines a numbe new machines which have b designed by expert mechan

In the construction of machines we have availed selves of the services of hig practical men of long stanc thus enabling us to offer to public goods which are un passed both for quality service.

As an evidence of this la numbers of strong testimon which we will furnish upon quest, have been received f satisfied customers.

Also being closely conne with one of the leading lum

Wood Sawing Machines

We make these machines in three sizes and kinds; short swing, long swing and flat roller table.

The Long Swing is a winner, being built for heavy work and will do a large amount of it. The tables are built of the best seasoned hardwood and strongly braced.

The greatest care is exercised in the iron and steel work.

The balance wheel is a solid web and very heavy, weighing 180 lbs.

All machines are equipped with 28 inch saws unless otherwise ordered.

Four Horse Thresher

Built especially for use with Gasoline Engines.

Experience has shown us that Gasoline Engines are coming more and more into use as a power for threshing purposes.

With this Power, the demand is for a machine small enough to be moved from place to place with ease and yet of sufficient capacity to turn out a big days work.

Our Four Horse Machine is especially built to meet this demand. A five to seven horse power Engine will operate it with ease. Can be supplied with or without tailings elevator, bagger and also with trucks if so desired.

Two Horse Thresher

This is the machine on which our reputation has been built and is without doubt the best machine on the market.

Can be operated with Two Horse Tread Power or with Gasoline Engine. It is decidedly in favor where limited quantities of grain are to be threshed.

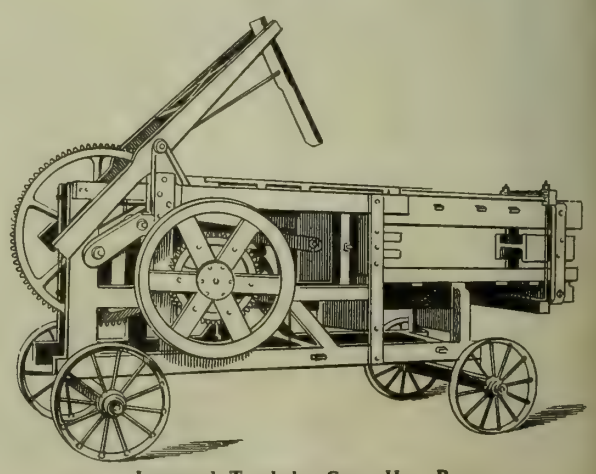
Improved Trenholm Gear Hay Press

Very strong and substantially built. The parts subject to the most strain are built of seasoned Rock Maple and the whole machine is so powerfully constructed that no jar is felt in any part when in operation. The bale is steel lined. The side spri which are thoroughly tested made of 1-4x3 inch best qua spring steel. The folder is perly located to do perfect w with ease and requires but slight spring pressure to oper Every bale will be uniform weight and neatly folded.

The capacity of this pres limited practically to the skil the man in charge and the po supplied.

This machine will do more w with less power than any o on the market. It can be o ated with a Two Horse T Power or Gasoline Engine. course the more power supp the more work can be done.

Wood Sawing Machines.

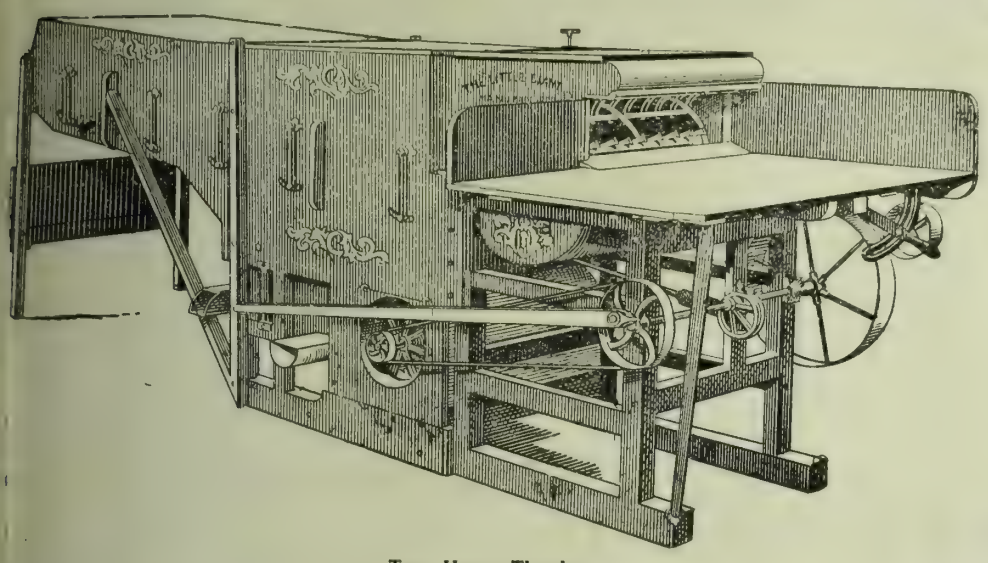


Improved Trenholm Gear Hay Press.

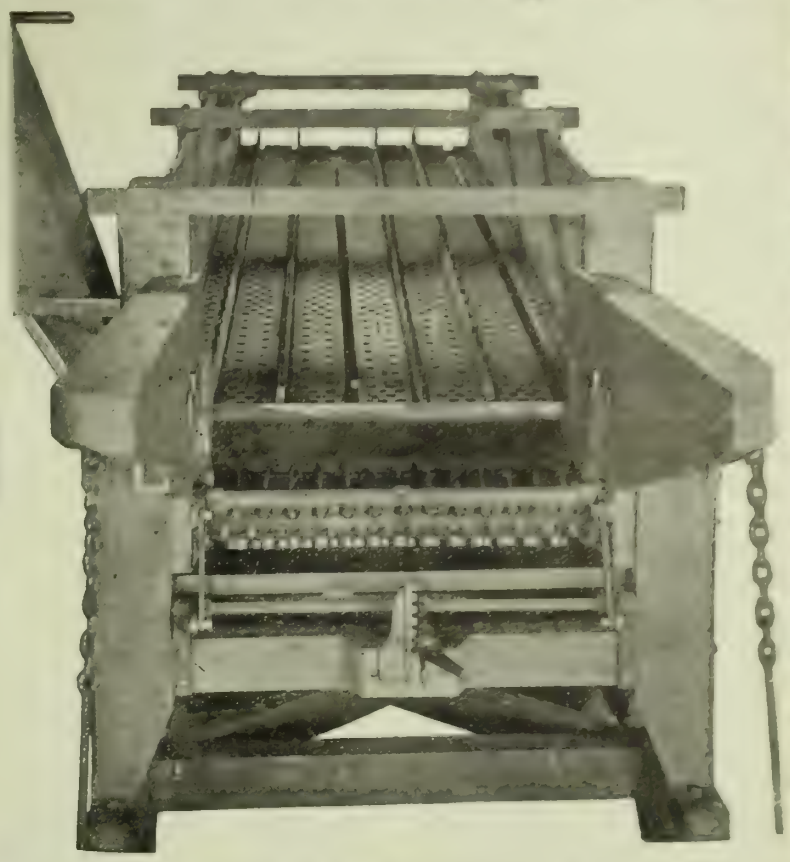
Company's Line Is Complete

concerns in Eastern Canada, we are in a position to get the very best lumber some years in advance of the time when it is required to be used ; thus giving us an opportunity of thoroughly seasoning the wood by the air dried process and it is found that our machinery which is so constructed gives splendid satisfaction and is better able to stand the climatic changes to which it is subjected in actual use.

One of the strong features is, that every machine we build is set up and given a thorough test before it leaves our factory.



Two Horse Thresher.



Inside of New Model Undershot Thresher.

Garden Seeder

In selecting a Garden Seeder he best obtainable is the one ou should have.

Our seeder has years of success ehind it and with improvements ecently added, makes it without loubt the best machine of the ind on the market.

The seed discharge of this nachine can be exactly regulated y moving the steel plate at the ase of the seed cup as per direcions on the side of each seed cup.

The flow of seed can be intantly stopped by a swinging cut ff operated by a chain attached to one of the handles. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim, keeping it from sinking into the soft earth.

No better seeder can be built for the accurate and fast sowing of turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seeds.

New Model Undershot

This Undershot Thresher is designed to meet the requirements of those who need a heavier and faster threshing machine than our Four Horse.

It is made very strong throughout. The frame is of the best straight lumber, well joined and thoroughly braced, so that when the machine is running at its full capacity there is very little vibration. The grain can be taken from either side of the machine and change can be made while in operation.

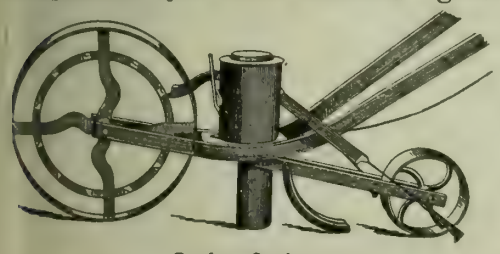
It is fitted with trucks, tailings elevator and one length of straw carrier. A bagging attachment is supplied at a slight additional cost and can be used on either side, to which bags can be easily attached, provision being made for two bags.

The New Model Undershot Thresher is operated with an eight to ten horse power Engine. The main bearings are all equipped with compression grease cups. A convenient tool box is placed underneath the cylinder. thus keeping the tools that you need near at hand.

Inside of New Model Undershot

The body is 40 inches wide. The separating device consists of a number of kickers which thoroughly agitate the straw and take it direct from the cylinder.

For the perfect separation of grain, this machine has no superior.



Garden Seeder.

Owing to our limited space, we are not able to show cuts of all the farm implements that we manufauture. We will be glad to send our catalogue to to anyone who sends us his name and address on the attached coupno or drops us a card.

Manufacturers of Threshing Machines in four sizes; Horse Powers in two sizes ; Hay Presses, Wood Cutters, in three different sizes ; Grain Grinders, Root Pulpers, Garden Seeders, Feed Boilers. A large and well assorted stock of Plow Castings, a large and complete line of House Finish. Refrigerators, School and Church Furniture and General Workers in Wood and Iron.

How I Make a Profit With Sheep.

(Continued from page 481).

the beach has some risks. In severe weather ice makes quite a sea wall and there is usually some entrance which the tide sometimes closes up before the flock get back to come home again. On my second winter here I got a lesson that I have never needed again. Wondering why the flock did not turn up one night, I hurried to the beach where I last saw them and found them out in quite a rough tide. It took Herculean efforts to save the most of them, but 11 of them perished before I could get them out. To those handy to the seashore the sea-weed and dulce is quite a help towards wintering a flock of sheep, but they should not have to depend on it altogether, as they do on many of the islands around the coast.

I have not been in the habit of feeding grain to my flock, as it adds just a little too much to the expense.

In keeping a flock of sheep profitably I have always made it a point to look out that the fleece paid the expenses of wintering and it takes quite close figuring to manage it; but I cannot recall a winter when it did not do so for me. I simply count the cost of making this June grass and daisy hay, that I have mentioned, against the sheep as otherwise it would simply go to waste. I only remember one season, and that was an exceedingly dry one, last year, when the crop of June grass failed. After more than the usual efforts, I managed to secure only one ton of it. However, I did not have to look far for something just as cheap and nourishing to take its place. A neighbour had a small field of weeds that he did not think much of. Usually weeds are pretty hard to make, but this was mainly Lady's Mantle, which cures easily, and makes a nourishing feed for sheep. I got the stuff for $3.00 and it cost about another $3.00 to make it and put it in the barn and there were 3 horse loads of it. By the way the sheep look now and the way this feed is spending it will not consume all the value of their fleece to take them through this winter.

While on this subject I might mention another economy I practise towards the flock in turnip raising. It is no use to count the cost against the flock by the price per bdshel of turnips on the market. Simply count the cost of raising the turnips and raise them as economically as possible. But to lower the cost of production to the flock, I plan to raise quite a few more than I need. Then I pick out all the saleable turnips, when taking up the crop, for which I can find a ready market for table use and sometimes I sell as many as will pay most of the expense of raising.

Thus the reader will see, that it is very little more expensive to get a flock of sheep through the winter here than it is in Scotland. Our pastures get quite a rest and do better for it next summer, our mowing fields, many of them need turning over and seeding, and a patch of land that a good crop of turnips have been taken from is usually in fine condition to be seeded down again.

SHEARING THE SHEEP.

If the lambs come in May it is best if the weather is not too disagreeable, to shear some three weeks earlier; but the sheep must be handled with great care ot you may lose some lambs and perhaps sheep by it. I do all my shearing at that time of year between 9 a.m. and 2 p.m. I do not shear if the day is damp or very chilly. I like to have a little sunshine and try to get a hold of each sheep without any struggling. The sheep to be sheared is set gently on her hind quarters, and the breast and belly are first sheared; then the left side is taken to the back and around the neck, finishing off on the right side. At this season of the year I always avoid shearing close to the skin. The warmth and well being of the sheep is of more consequence than an extra half-pound of wool. All the shearing machines that I have seen are objectionable because they cut too close to the skin. I believe that what we leave one year we will get the next and it is very valuable to the sheep for the time being. I rarely have occasion to tie a sheep's legs while shearing, and when I do, it is with a soft rope made of cloth. Only 3 legs should be fastened, leaving a hind one free. As soon as each sheep is sheared, I commence basting her with grease slightly warmed. Sometimes the grease is rancid butter or lard picked up cheaply at the grocery stores. More frequently it is fish oil but I give them a good dose of it all over and if there are any ticks around, it soon ends them. After the sheep are well greased, they do not seem to mind the cold very much; but their sleeping quarters should be well bedded and dry.

THE LAMBING SEASON.

When the sheep are getting within a week or two of having their lambs, I drop turnip feeding for a while; but as soon as a sheep lands two lambs, I give her all she will consume again. A sheep with a single lamb can generally look out for her own needs. While the lambs are coming it is well to be with the flock pretty frequently. Sheep, however, should never be disturbed at this time as they are apt to be nervous, but a good shepherd can go to and fro among his sheep at all times without their paying any attention to him. If you wish to save your flock from any mishaps do not at this time allow any strange persons or dogs to come anyway near it. When a dead lamb comes I always make it a point to replace it as early as possible, if I have a twin on hand. There is no need to allow a good sheep to run idle a whole season when there are others around raising two lambs. It is a simple process to tie the skin of the dead lamb on to the live one which I wish to take its place. Then the sheep and her foster lamb want to be put in rather dark and warm quarters for a day or so till they are quite attached to each other. If the sheep has plenty of milk she soon gets fond of the lamb. I am often troubled by one sheep stealing a lamb from another, and when I come across a sheep with 3 lambs and others around having only one I always give her credit for having stollen one, and set to work to put things right again. When the lambs have all arrived it is best to dock your likliest ewe lambs as there is less risk doing it while they are young. I have never found that it paid to trouble ram lambs that are meant for the butcher, when 3 or 4 months old.

SUMMER PASTURE.

A good summer pasture for sheep and lambs should have a variety of feed of a nourishing nature, but they do not care much for tall grasses of any kind. The lambs love the clover, the dandelion and the daisy and will put on weight rapidly amidst them.

If there is a flat place in your pasture that has been flooded over and come up flush and green, it should be fenced in to keep the sheep away from them as it is a dangerous feed for sheep. There are apt to be germs in such grass that will cause liver rot for which there is not much remedy. When the sheep begin to show swellings under their jaws they are in too advanced a stage of the disease to be cured. I lost a great many sheep from this cause till I fenced off or drained the dangerous spots and limed and salted them too.

Your pasture should also have plenty of shade and some good water. Sheep, it is well known, will do with

less water than any other stock, as they are most industrious when the fields are wet with dew.

I have had no experience raising rape or other sdmmer feed for sheep because feed is usually quite plentiful on my ranges, but it is certain that if your pastures are not good enough to make single lambs dress 40 lbs. when between 3 and 4 months old, it will pay you to have some rape for the flock to help fill their stomachs. At the price of lamb now-a-days there is nothing pays so well as to get as much weight on the carcass as possible. I know a small flock owner who had been in the habit of raising 20 or more lambs, that would dress on an average 30 lbs. each when between 3 and 4 months old. About two springs ago he put quite a patch of old mowing into rape, which made a good growth and so did the lambs when they got to it and the following August they dressed over 40 lbs. each. The work and fertilizer on his rape patch cost him $13.00 and the gain from his lambs amounted to $28.00, leaving him $15.00 clear profit, not to speak of the improvement in the land which was in fine readiness for another crop.

A great many of our run-out mowings are not poor. The grass on them have become exhausted, for when well stirred up and fertilized a little, they respond generously. Now it pays to keep them yielding something, and there is nothing so well worth yielding something for as to add to the weight of our lamb crop.

If it pays to get weight on your porker that only brings from 8 to 10 cents per pound, weight on your beef cattle for which you are glad to get 9 cents to 10 cents per pound, consider how much better it pays to get weight on your lambs that sell readily during August at 14 cents per pound.

DIPPING THE FLOCK.

By greasing the sheep well after shearing, I do not find it necessary to dip before August or September. Dipping the flock then gives them quite a protection against the maggot fly, which is at its worst from the middle of August till the 20th of September. If a little pine tar is put on the nostrils of the sheep, at the same time, they will be safe guarded from another pest, the nasal fly, which is apt to make maggots in the head of the sheep, and which annoys a flock dreadfully at this season. If a flock is going to do its best for its owner, it must not have to submit to annoyances of any kind.

MARKETING THE LAMBS.

When the lambs get over 3 months old and are well fleshed up, I am ready to sell either on foot or dressed at the market price. A good lamb during August will dress half its live weight; so if the market price is 14 or 15 cents for lamb, I want 7 or 7½ cents on foot. If I sell dressed, the skin will pay the expense of dressing and getting to market.

My pure-bred lambs, at least the likeliest are weaned towards the end of August, and have the run of a clover patch, where they are kept gaining till Fair time, when there is usually quite a little call for them. Il the local demand is poor, a small advertisement in the Maritime Farmer brings me all the customers to which my flock can cater.

The worst disadvantage in shipping to a distance, and it is one that public attention should be called to, is the high express charges. Ram lambs cannot be shipped two or three hundred miles by freight as they are too young to stand it, and if sent by express they go promptly forward, but it adds too much to the cost of the lamb and a great many owners of small flocks, who would like to have a pure-bred ram, will get along with some handier grade for this reason. It seems to me that what stock owners want is a fast freight at just

double ordinary freight charges. The railways in other countries provide that stock can go promptly to its destination. All that is required is that a freight car be attached to the passenger train. Much more business could be done in the sale and exchange of stock if we had this convenience.

A GLANCE AT THE PAST.

It was many a year before I had such another big year for results as my first year here in the business. Somehow the dogs found me out and pestered my flock unmercifully for many a year. Such a large body of water alongside the sheep pasture became a great source of danger and loss. The dogs in the first instance probably set out to hunt rabbits, but coming on a flock of sheep and finding them as ready to run as the rabbits, they would follow the sheep up and perhaps single out one or two, which when hard pressed would take to the water. Some dogs would follow the sheep out till she drowned. Others would yelp around the beach preventing the sheep from landing anywhere till she would have to give up and all the time the tide would be making such a racket that I could neither hear nor assist till all was over. Sometimes a few sheep would get clear and come for home and give warning and I would get up with the gun and sometimes do a little execution.

On one occasion I went up and found two dogs had a flock of over 50 out in the tide, while they were yelping at them from the beach. So busy were the dogs that they never noticed me till I had one shot dead; the other got off in a wounded condition. Fortunately the whole flock kept together and were bunched around some high ledges, but as the tide was quite rough, I had perhaps the biggest job of my life getting them ashore. A lot of such experiences, year after year, made me sometimes sick of my business.

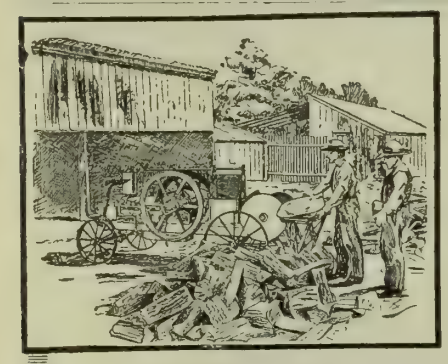
Sheep will not do so well when they are frequently disturbed. An animal of any kind kept in a nervous, excited condition is not feeling very susceptible towards putting on flesh. If you cannot get your lambs to put on flesh as they used to, the sheep business does not seem such a desirable one to be in, so I turned my attention more towards dairying for a few years. Of course I still kept looking to my flock for some returns and they never quite failed me.

To those who have been getting their living, in the easy way that I had been accustomed to get it, from a flock of sheep, dairying seems an immensely labourious business. One is kept at the constant grind, while a flock of sheep, if there are no troublesome dogs around, require very little care and attention.

MY SOUTH DOWN FLOCK.

After a few years I found myself starting a small flock of South Downs. My flock of this breed was founded with eight ewes, all recorded, and one ram bought from the late John Miller, of Markham. A little later in the fall, I got a very fine ram from Wm. Hamilton, Fredonia, N. Y. Two more yearlings the following spring, from Mr. Miller completed my foundation flock. I kept them in the fields handy to the house and did not have much loss for a few years. The increase was encouraging. There was a ready market all around for the ram lambs at a moderate price, and quite a call for ewe lambs and yearlings. Quite a few of them

(Continued on page 492).



An I H C Gasoline Engine Will Pay You Best

IF you really want your money's worth when you buy a gasoline engine, buy an I H C with plenty of power to do your work.

A gas engine that is not well designed, that is built roughly or of inferior material, is worse than none at all. It costs almost as much as a good engine to begin with, and costs much more afterward in repairs and loss of time.

Buy a reliable I H C engine and save yourself an endless amount of worry, lost time, money, and temper.

I H C Gasoline Engines

are simple, dependable, durable. The carburetor or gasoline mixer is the simplest and most effective known. Anyone can regulate it perfectly. Ignition is positive. The ignition apparatus is so simple you can understand it at a glance. The fine-grained, grey, cast iron cylinders and pistons are worked together to a perfect fit. The ground piston rings insure maximum power from the explosion.

All moving parts are perfectly balanced. The bearings are unusually large and carefully fitted. Every part is amply strong and no part is too heavy to be most efficient. In every detail, the I H C is a good engine—one you can depend upon for years to do your work when you want it done.

I H C engines are made in all styles—vertical and horizontal, portable and stationary, air and water-cooled; in sizes from 1 to 50-horse power, to operate on gas, gasoline, naphtha, distillate, kerosene or acohol. Gasoline and kerosene tractors, 12 to 45-H. P. Grinding, sawing, pumping, and spraying outfits, etc.

The I H C local agent will show you the good points of the I H C engine. Get catalogue from him, or, write the nearest branch house.

TAMLIN'S

Nonpareil Hot Water Incubator

Holder of the World's Championship in hatching. Used by the Royal Families of England and all European Countries. Awarded 53 Gold Medals in hatching competitions against Incubators from all parts of the Globe. Breeders of fancy and Exhibiiion stock swear by it. Three shipments already sold this year to the Dominion Government at Ottawa. the delight of Macdonald College, St. Anne, Que. The pride of Ontario Agriculture College, Guelph, Ont. The Danish Government, the World's formost poultry country, would not be without it. Crowds gather around it at every exhibition. Two American Incubator Firms have bought one for their own private hatching, these two sales were made at Winnipeg 1910 Exhibition on condition that we did not use their names. Wherever you see it it will always go. Wherever you go you will always see it. The Nonpareil is the only Incubator in the World that the Sun never sets upon, as it is in use in every country on earth. One Manitoba Farmer says he has never been lonesome since he bought one, as the neighbors for miles have been hearing about it and coming to see it. Thermometer of the Nonpareil registers on the outside of the egg drawer, right before your eyes all the time. Not made down to a price but up to a grade standard. Lamp burns 30 days with one filling. Oil always at the same level in the lamp. Finished like a piano. Fit for the parlor of a King. Made in London, England, and will wear forty years. Canadian customers joyful with results. Different from common makes. 100 egg size will give you more grown up birds to sell in the fall than any other machine of 200 egg capacity. No cold death trap below the egg drawer called nursery in other Incubators, for the chicks to drop into immediately after hatching, where a cold is developed with great loss afterwards. Heated drawer shown in picture with open lid, directly above the egg drawer, where little chicks rest comfortably and happy until ready for the brooder. Our Patent Wick is a revelation to other Incubator Firms, burns smokeless, odorless, will not combust, gives a strong heat with a clear white light that does not flicker and consumes very little oil, sold at 10c. each to fit any Incubator, or honse lamp. The Nonpareil Incubator is the machine you will eventually buy. It will save you $5.00 every hatch over any other Incubator on the market.

The Best Time to set an Incubator

is any time in May or the first week in June, chichs hatched at this season will grow faster and lay earlier in the fall than earlier hatched chicks that have started to moult.

Waterloo Boy Gasoline Engines have all the Good Points that go into any Gasoline Engine!

Superior points of their construction are the open jacket, speed lever, governor, mixer and igniter. Our catalog describes these points fully

---

WATERLOO BOY ENGINES are practical and reliable. They have few working parts, are so simple that anybody can run them, extremely economical in use of fuel, develop greater horse power than rated.

WATERLOO BOY ENGINES can be started when thermometer is twenty degrees below zero nearly as easy as in July.

WATERLOO BOY ENGINES are backed up by an iron-clad five-year guarantee.

Waterloo Boy Engines are placed in your hands with an absolute five-year guarantee

---

These are some of the reasons why the Waterloo Boy Engines are the best for farm use.

"It hath been said" by other manufacturers of gasoline engines that WATERLOO BOY GASOLINE ENGINES are built of poor material and are cheaply constructed, but we say unto you, that verily our competitors do not speak the truth. We challenge any manufacturer of gasoline engines to show a better grade of castings and other material than go into our engines, or to show more pains taking care in machining the important parts of these engines. From the standpoint of material and careful workmanship WATERLOO BOY GASOLINE ENGINES rank with the best.

We frankly admit that we do not put as much labor on our engines in buffing them and polishing certain parts as do some. These things are not the essential parts of a gasoline engine. Labor spent on the unessential parts of the engine does not add one whit to its strength or efficiency, but it does increase the manufacturing cost materially, and these polished parts of a gasoline engine soon get rusty, when exposed to the action of the weather.

Our supreme aim is to produce engines of the greatest efficiency and durability at the least manufacturing cost.

WATERLOO BOY GASOLINE ENGINES are lighter in weight than any other gasoline engines manufactured.

In reducing the weight we have not reduced the strength of the engines.

Unnecessary iron is a dead loss. It adds to the manufacturing cost, it increases freight, it makes more weight to haul around and to handle.

We build, not for show, but for service. The WATERLOO BOY is not a city dude. He is a plain, honest, every day sort of a fellow.

You can depend upon him day in and day out, in sunshine or storm, in heat or cold, year in and year out. Just turn on the switch, give the flywheels a turn or two and he is ready for work. He never shirks, but is always ready and willing to help you.

WHAT THE PICTURES REPRESENT

A few interior and outside views of barns that are equipped the B. T. way are shown in these pictures. Barns equipped this way reduce stable work to a minimum. They are bright and attractive in appearance. It is no trouble to keep them in a clean sanitary condition.

First we show a long row of cow stalls. Next a row of calf pens, then a barn with litter carriers, another interior view showing stalls (heads out), and, lastly, an outside view of what we consider is a model dairy barn.

FREE BARN PLAN SERVICE

With B. T. Sanitary Barn Equipment you get something besides your equipment. To get the best results from your cows your barn must be properly planned, properly ventilated and constructed up to a certain standard. Good equipment alone will do it. We want our customers to be thoroughly satified with their stables wherever B. T. Stalls are used. For this reason we have gotten out our book, "How to build a Dairy Barn." Fill out the coupon, and you will get it free.

The information and plans shown in this book, if supplied by any competent architect would cost you a large amount, but we go further than supplying general plans and information. We will adapt the plan to meet your specific requirements' no matter what they may be. Whether you are building remodeling or just making a few changes, whether your barn be large or small, the special knowledge of barn-designing and the wide experience of Beatty Bros. is at your service.

YOU dairymen who want increase profits from your milk production must look carefully to the arrangement and equipment of your barn. The inside of your barn is of vital importance. Through the equipment alone you may gain or lose hundreds of dollars each year. Dairy farming is like any manufacturing business. Your farm and your stock represent you plant. As in any other business, one most important means of increasing profits is the cutting down of expenses. In farming this may be accomplished by the correct planing of your barn, together with the use of B.T. Sanitary Barn Equipment. Correct planning of your barn and proper arrangement inside will secure you greater storage room for grain and feed without extra cost. Your barn will be so arranged that your grain and feed can qe housed with the least possible labor. It will enable you to care for more cows in the same sized barn. It will save you and your men time and labor every day by cutting in half the work of feeding and watering stock, in cleaning the stable, and in doing other barn work. It will protect your stock against disease, worry and accident, and many other advantages will be brought to light when you investigate every feature thoroughly—read on and see.

B.T. Sanitary B

DANGER OF FIRE LESSENED

A stable equipped with steel stalls and a cement floor is in very much less danger of taking fire than a stable equipped with wood stalls and a wood floor. In case of fire. cows tied with B.T. Stanchions can be released in buarter the time necessary to release them from a chain tie. Steel stalls and a cement floor offer absolutely no place for harboring vermin.

DURABILITY IS IMPORTANT

A stable equipped as above is practically indestructible. You are not troubled year after year with replacing and repairing. Should it ever be necessary to remove the barn, the steel stalls can be knocked out from the cement floor and set up in any other barn without any loss.

Many of the finest dairy barns have been built according to the plans we have submitted, and equipped throughout with B.T. Equipment.

No matter how many cows you have, no matter whether you are building or remodelling your barn, the saving effected by B.T. Sanitary Barn Equipment will pay for itself in one year's time. In addition, the expert counsel and advice we can give you, due to our wide experience in skill and planning, may save you a large amount of money on the original cost of building. Just by an inspection of plans, we have frequently suggested changes that resulted in the saving of hundreds of dollars, besides making marked improvements.

We have large completed blue prints with floor plans, sides and end elevations, and measurements for a great many different sizes and styles of barns. They embrace the most improved methods of construction, and we can furnish them with complete specifications and bill of material.

THE GOVERNMENT USES B.T. EQUIPMENT

During last summer a great number of Government barns were built in different parts of Canada. In every instance B.T. Equipment was used throughout. Careful investigation was made in every case by the Government authorities before orders were placed. Price was no object. In fact, in at least two cases other firms offered their equipment free, but in every case the full price was paid for B.T. Equipment.

B.T. Equipment must have merit, as these orders given below show, which are just a few of the large barns which we equipped last year. These barns put in B.T. Equipment throughout:

Three barns for the Dominion Government, one at Agassiz, B. C., one at Charlottetown, P; E. I., and one at Cape Rouge, Que.

Two barns for the Ontario Government, one barn at Monteith, New Ontario, and a very large barn at the new central Prison Farm at Guelph.

The large barn for the Saskatchewan University and Agricultural College at Saskatoon.

Possibly the largest and best dairy barn in Canada for the British Columbia Government Asylum Farm at New Westminister.

Seven dairy and horse barns for the Alberta Government for their seven experimental farms which they are establishing in different parts of Alberta, and also a large barn for their Asylum Farm at Ponoka.

Besides these Government barns, we equipped this last year many very large dairy barns. Among others a barn with 100 steel stalls for the Edmonton Dairy Company, two barns with 160 stalls for the Price Dairy Co., of Toronto, one barn with 120 stalls for the City Dairy Co., of Toronto, a barn with 125 stalls for the Moose Jaw Dairy Co., a large barn for Hayes Bros., of Carstairs, to supply Calgary with certified milk a large barn for the Homewood Sanitarium of Guelph. Also stables on the Farmer's Advocate farm "Weldwood."

You will notice that this list includes many of the largest and best dairymen in Canada. These men won't monkey with equipment that gives trouble. Its got to be right. B.T. Equipment is right.

Our Broad Guarantee

Every feature of B.T. Sanitary Barn Equipment is thoroughly tested in actual use before it is placed on the market. When you buy B.T. Equipment you know that you are not being experimented on, and we know that our equipment in every case will give satisfactory service, therefore, we are able to give an unqualified guarantee with all our equipment. You take no chances in buying B.T. Equipment. It is absolutely guaranteed to give satisfactory service in your barn.

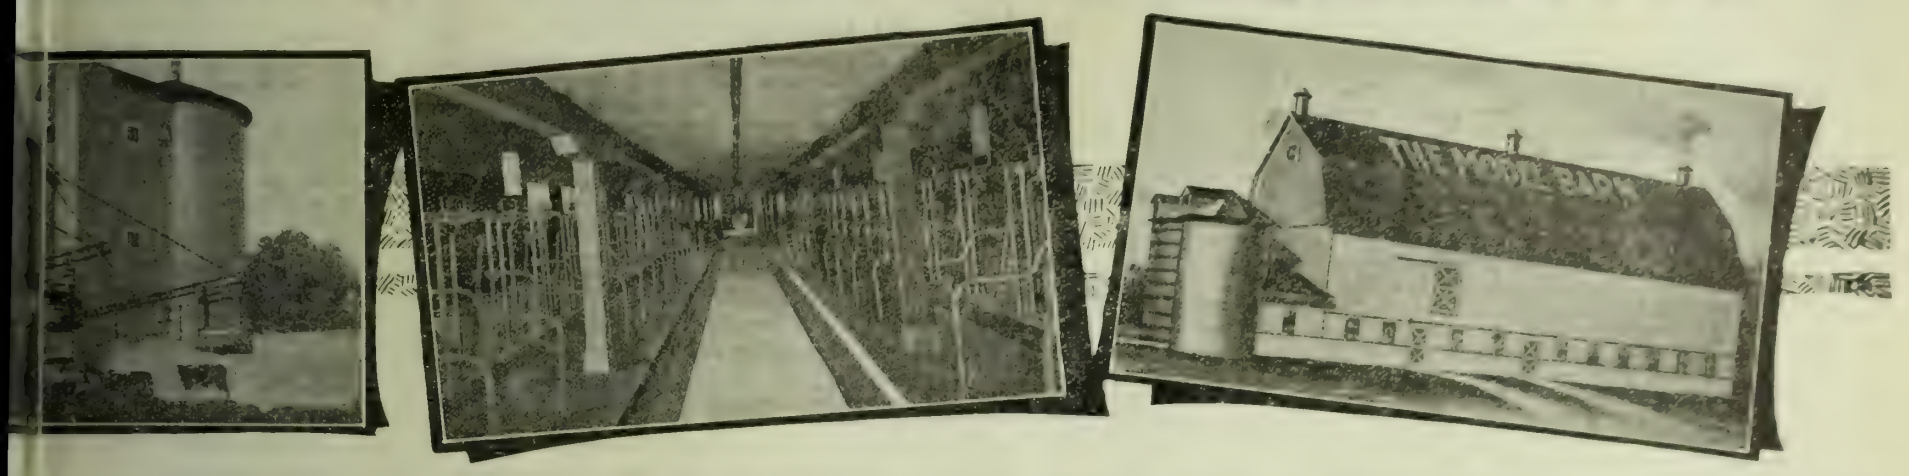
...nitary Barn Equipment



NOTE THE EXCLUSIVE FEATURES ON B.T. STALLS

There are many outstanding features in which B.T. Stalls excel all others. Some of them are illustrated in the pictures at the bottom of this advertisement. The saving on feed and labor, made possible by the adopting of these features, will pay for the equipment in a year's time.

And in addition, the perfect freedom and comfort given the cows and the greater cleanliness made possible will increase the yield and improve the quality of the milk.

No other investment will pay as big dividends as B.T. Barn Equipment. No other investment will give you greater pleasure than seeing your stable equipped with a bright, sanitary and up-to-date steel stall equipment.

When you install B.T. Barn Equipment you will note many advantages and convenience and a greater protection for your cows. You will see how this equipment lessens abortion, and does away with the principal causes of big knees, ruined udders and many other injuries. You will see how the individual mangers prevent over-feeding and under-feeding.

Read on learn some of the features that mean dollars and cents to you, and comfort and protection for your cows. And, remember, only on B.T. Barn Equipment can you get these features, because they are patented and used exclusively by us.

...Barn Equipment

Double Curved Stall Partition

The B.T. Double Curve Stall Partition affords protection for the cow which you cannot get with a single curved partition. The cow, when lying down, Is protected from her neighbor stepping on her udder and ruining her. The downward curve permits the cow to turn her head in the stall and walk out in the natural way. They are very neat in appearance.

Alignment Device

This, perhaps, the greatest improvement on stanchions ever brought out. It makes possible clean cows, because all the cows, large, small or any size, are aligned up evenly on the gutter. By means of this device the stanchion can be moved back or forward in the stall a distance of twelve inches. This device is patented and used only by us.

Sure Stop Swinging Posts

This device provides a rigid point between the rigid arm of the stanchion and the stall partition when the cow is coming into the stall making it impossible for her to put her head anywhere but in the stanchion. When the cow is in the stanchion, this post may be swung back out of the way, giving the cow perfect freedom.

Stanchion Rates

The stanchion, when open, is held in place by a small clip on the partition. This clip keeps the stanchion always in place, and is very easy to drop the stanchion into, compared to the ordinary little clips and trappings used for holding the stanchion in place while open, and the beauty about it is that it leaves the stanchion open the maximum width, so that it stands from 6 inches to one foot wider open than any other stanchion. With this device, combined with the Sure Stop Post, there is never any trouble getting the cows into B.T. Stalls.

Self-Cleaning Manger

Our Self-Cleaning Manger is made without a bottom—the concave trough built into the cement serves that purpose. The manger is easily raised. All refuse is left in the smooth continuous trough, which when swept out, can be used for watering in. This saves the cost of water bowls. You have a good capacious manger that insures you against waste of feed. You also have an individual feeding place for each cow, so that she can be fed according to her needs.

Other Important Features

We would like to tell you about the B.T. Stall clamp. The B.T. Stanchion Clevice. which gives us our high level curl. The B.T. Stanchion with its strong features. The B.T. Calf Pens. The B.T. Bull Pens, all containing special features which, owing to our patents, cannot be used by other firms, but the space in this ad. will not permit. Let us send you our catalogue. It will cost you nothing, and you will then be able to see for yourself, that what we claim for B.T. Equipment is true.

You will then see that all the large dairymen who buy nothing but B.T. Equipment, and also the Dominion and several Provincial Governments, who always use it and have good reason for their choice.

Fill out the coupon, and we will send you our catalogue, giving you full information, and also our book, "How to Build a Dairy Barn," free.

WRITE TO-DAY

Beatty Bros.

Fergus, Ontario.

The B.T. Litter Carrier

The best way to keep the dairy stable clean is by means of a good litter carrier. They are water-tight. There is no drip or dirt spilled along the passage-way. On a level overhead track it is easy to handle large loads of manure and no matter what condition the yard may be in, the manure can be placed a good distance from the barn. Or, if desired, with just the one handling dumped directly into a wagon or sleigh for hauling to the field.

The B.T. Litter Carrier is well known. More of them are sold in Canada each year **than all other makes combined twice over.** They are built strong enough to give satisfactory service year after year and have many features of advantage not found on other carriers. We show our faith in the B.T. Litter Carrier by guaranteeing it absolutely for five years. Ask your neighbor who is using one about it.

B.T. Hay Carriers

No storage barn is complete without a hay carrier outfit. In fact, today, no one thinks of building a barn without putting one in. The B.T. Hay Carrier Line comprises some 16 different styles of Horse Fork and Sling Outfits. They are in use everywhere. Our catalogue will give you full information about them.

Don't think that B.T. Equipment is too expensive for you. B.T. Stalls cost no more than other makes of steel stalls, and a good steel stall outfit can be installed in your barn as cheaply as the old style wood stall.

Why not have the best? By filling out the coupon you will know what it will cost you to fit out your barn with B.T. Equipment.

How I Make a Profit With Sheep.

(Continued from page 490).

were shipped to fill orders from the West Indies and elsewhere at good prices. The crossing of my grade Shropshire flock with South Down rams gave me some handsome lambs. It was not uncommon to get single lambs at 3½ months old that would dress 12 pounds and over per quarter.

To illustrate the rapidity with which these grade lambs put on weight and also to show how I could get more money out of some of my pastures by a flock of sheep than by good Jersey cows, I am in a position to give you the following figures: In May, 1905, I put 12 ewes with 16 grade South Down lambs on my lake shore pasture. They had been sheared a few weeks earlier and, as usual with me, their fleeces more than paid for their wintering. They owed me nothing, consequently what I made out of them would be clear profit. For the three previous years this pasture had been used for cows during the months of June, July and August, later than August it would dry the cows up. It was not a good pasture for cows as there were too many weeds, such as Black Dandelion, Wild Garlie, Lady's Mantle and Yarrow which tainted the butter some during the summer months. During the summer of 1902, three cows yielded 271 lbs. of butter. In 1903, the same cows only yielded 259 lbs. and in 1904, they gave 264 lbs. This slightly tainted butter only brought 18 cents per pound, so that the average yield for the three years was $47.64. The skim milk would not half pay for the labour of milking the cows and making and marketing the butter. I marketed the above mentioned 16 lambs in August, 1905. They were very plump and their live weight was 1282 lbs. which at 7 cents per pound came to $89.74. This was an amazing sum to take out of a small pasture, of 18 acres, nearly half of which is bog and bush and the most of it very rocky. Not more than an acre had ever been cultivated and was then in a run-out condition. If I had tried to sell this pasture no one would have given me a hundred dollars for it. For some years when short of sheep stock I had rented it to pasture a yoke of oxen and got $10.00 by the season for it. It had also been used as a colt pasture bringing in an equal amount. I tried the same flock of sheep on it another season and noted the results. They stayed in this pasture till December when they were put with the ram. They were wintered as usual on hay and roots, sheared in April and their fleeces again more than paid for their care and keep. They were put back in the same pasture on the 16th of May, 1906 and with them they had this season 17 lambs. Nothing troubled them, they were seen to frequently, and occasionally a load of seaweed was spread around the pasture which was much appreciated. This August, 1906, I dressed the 17 lambs myself, and sold 651 pounds mutton at 15 cents per pound, making $97.65. I would like to have some of the Maritime Farmer readers show me an other kind of stock that could be put into a small pasture like this and bring out of it as much or more,

INTERNATIONAL

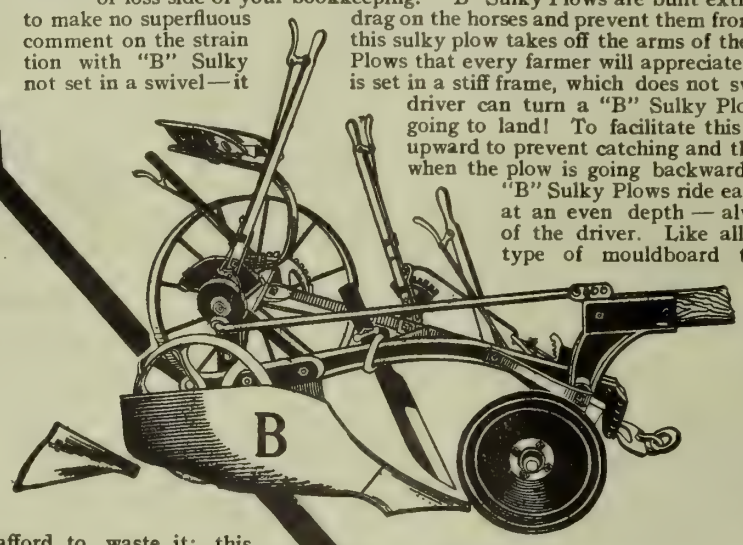
Light Weight Combined With Strength Makes This Plow Stand For Profit On The Farm

WEIGHT and strength are the two essentials in a sulky plow—the strength is needed to stand the wear and tear, of course, and on the weight depends to a large extent whether the plow is to stand on the profit or loss side of your bookkeeping. "B" Sulky Plows are built extra strong for heavy work and still light enough to make no superfluous drag on the horses and prevent them from covering the ground they should in a day. To comment on the strain this sulky plow takes off the arms of the driver is unnecessary. One point in connection with "B" Sulky Plows that every farmer will appreciate is the action of the rear wheel. This wheel is not set in a swivel—it is set in a stiff frame, which does not swing to right or left. The result is that the driver can turn a "B" Sulky Plow around backward—and know where he is going to land! To facilitate this back-up, the rear of the sole is also rounded upward to prevent catching and the colter also tilts automatically on the beam when the plow is going backward. It does not catch in roots and stones.

"B" Sulky Plows ride easily, cut evenly, turn a good furrow, and work at an even depth — always. They are always under full control of the driver. Like all "B" Plows, they are fitted with the exact type of mouldboard to suit the soil where to be used. This mouldboard, of course, is made from soft-centre steel. "B" Sulky Plows enable you to get more work out of your horses without driving them to anything like the exhaustion the ordinary plow demands—even in tough, sticky soils—they will scour anywhere—wet ands have no terrors for "B" Sulky Plows. Why not let a "B" Sulky Plow, backed by the Belanger reputation, save money, time and horseflesh for you—why not buy your plow on the basis that you are going to make it earn enough extra to pay for itself?



This is the light draft "B" Sulky Plow

If your dealer does not sell "B" Plows, write us and we'll tell you where you can see them.

FILL OUT THE COUPON GET THE BOOK FREE

THIS book is an authoritative work on the preparation of the ideal seed-bed,—the foundation of good crops. To buy this book would cost you a dollar, but if you are really interested and will fill out the coupon as an evidence of good faith, we will send you one copy of the complete volume FREE. The story is told in three chapters, — "Soils and Fertilizer," "Plowing and Plows," and "Seeds and Seeding." Each chapter deals with its subject fully, tells the whole story and tells it in such detail that its genuine, practical value to the active farmer is unquestioned.

Your invested capital is your land—your great asset—and you cannot afford to waste it; this book tells you about the most modern methods of conservation — facts which you owe it to yourself to know.

in one season, than the whole pasture would bring if put on the market. If there were lots of little flocks like this spread over these Maritime Provinces, what a source of wealth and well being they would be.

Who would bother raising chickens when lambs can be raised at one-quarter the cost, and brings about as much in our summer markets; or who would raise pork when lamb can be raised so much cheaper and bring on the market fully one-half more?

While talking with a farmer recently, who used to keep a small flock of sheep but who had gone out of the business because the dogs had made several raids on his flock, he admitted that he was not doing quite so well without them and that he was only waiting for the dog nuisance to be regulated so he could start again. Said he, "the constant worry and risk from dogs made me nervous, I could not sleep nights for thinking about them."

That dogs are the greatest draw-back towards doing a successful sheep business is generally admitted. I would not like to state fully just how much of a draw-back they have been to me during the past 25 years in case it might deter others, unnecessarily, from venturing into the business; for it must be admitted that the nuisance is much worse in some sections than in others. Before closing this article I must state how they wound up my flock of recorded South Downs. One dark night towards the end of August, 1908, I had been keeping them on my sea-shore pasture, for the previous few years as they had grown too numerous for the fields and I had lost quite a few of them from dogs the previous year. During June and July 1908 some of them began to go again in the old way, chased out into the water and drowned. As the pure-breds were more valuable than the grades, I put them into my lake shore pasture and turned the grades on to the sea-shore. The lake-shore pasture had always been pretty safe from dogs prior to this, because it was quite handy and partly in view. I find dogs always like to get out of sight before they commence to do do much damage. One night, when the wind was blowing strongly, two dogs came into this lake-shore pasture. The sheep were all right at dark, but at daybreak next morning I found them all dead, mangled or drowned in the lake. Not one was saved. I had now only my small flock of grades left. As soon as some of the worst of the dogs were destroyed, I began to buy back a few of my South Downs where I had been selling them in previous years.

So my flock to start the winter of 1908 was only 22 head. I had a liberal supply of feed, of the usual inexpensive but nourishing quality, and they reached the following spring in fine shape. Their fleeces as usual paid well for winter feed and care and they brought forward 29 lambs, anxious to pile on weight for me out of my very much under stocked pastures. I saved 5 ewe lambs to add to the flock. The remaining 24 lambs dressed 1003 pounds, which, at 14 cents per pound realized $140.42. Add $17.50 prize money to this and $25.00 for the 5 ewe lambs added to stock, and it shows $183.00 made out of a flock of 22 sheep in 1909.

My returns from 1910 were even better, but in the fall, the dogs reduced my flock again to some 26 head. I made some reduction in their numbers also, for by the end of the year I had a compost pile to which dead dogs largely contributed that spread over nearly a quarter of an acre of turnip ground next spring.

The summer of 1911 was very dry and the sheep wandered further out of sight than usual. The dogs did not trodble the flock much till July but then quite a few of them disappeared, while I was busy haymaking. Partly owing to the dry season and partly from being frequently disturbed by dogs, the lambs were not so plump and very few of them dressed over 36 lbs. each. The price, however, was good and the receipts from the flock amounted to $167.00, including premiums at the County Fair. The most discouraging circumstance is, that I cannot get my flock to increase. The dogs are bound to keep the numbers down. I have sold on some of my outlying pastures, but still what I yet own, should keep 3 times the number of sheep I have on hand. Yet, until our various authorities can regulate the dog nuisance somewhat, I see little prospect of increasing my flock.

The Nova Scotia Agricultural Report.

The Annual Report of the Secretary for Agriculture for the Province of Nova Scotia has been issued. It contains a review of the work of the various departments of the Agricultural College, including a report of the Experiments carried on with field crops, fertilizers, live stock, etc., as well as a statement of the number of students attending and the character of the work done by the College students during the year. One of the most striking paragraphs of this part of the Report is that which deals with Dairying in the Province of Nova Scotia, in which it is shown that, despite the drought of 1911, 5 per cent. more butter was manufactured in the Creameries than in the previous year.

The Report also contains an outline of the work connected with the various Agricultural Societies and Associations in the Province of Nova Scotia and a most flourishing condition of affairs is indicated.

In accord with the practice established five years ago, of introducing into the Annual Report a series of popular articles on topical subjects, the present Report contains a series of very interesting and valuable articles on Horse Breeding in Nova Scotia. These articles deal with almost every phase of the Horse Breeding business, including a description of the various breeds, articles by horsemen on the various phases of the management of horses, and a practical discussion of the methods of treatment of the ordinary diseases of horses.

The whole Report is well illustrated and will prove a most interesting and valuable document to the farmers of Nova Scotia. It is now available for distribution and will be sent free to those who make application for it.—M. Cumming.

Buy A McCormick Binder This Year

GO to the McCormick agent in your town, before the harvest season begins, and have him set up a binder for you to inspect. Buying a McCormick binder is the easiest way yet devised for saying good-by forever to all harvesting and haying troubles in the field. Seventy-five years of invention and experimentation go into this binder. The hardness or softness of every shaft and bolt in McCormick machines is a matter of accurate knowledge. Making a good binder is a matter of many kinds of knowledge and experience, and a good harvest is a matter of a good binder.

Tell the local agent you want a binder made for your province, designed especially for upper and lower Canada, and he will show you the 1912 McCormick, made at Hamilton, Ontario. Ask him to explain the reel adjustment to you. It alone is enough to establish a reputation for any machine. It can be adjusted high, low, forward, or backward to save grain under all conditions, whether it is short, tall, standing, down, or tangled. This reel eliminates the possibility of waste.

Have the local agent show you a McCormick binder, mower, rake, tedder, or hay loader, or, write the nearest branch house for a McCormick catalogue.

Raise The Crop That Never Fails

Just sit down and write us for full particulars of the best business proposition you are likely to hear this year. Let us tell you, in plain words, how very little money will start you in the profitable business of poultry-raising The Peerless Way. Let us show you why it will pay you well to adopt the Peerless methods, to make use of the advice and aid of the Peerless Board of Experts—pay you well, and profit you speedily.

One PEERLESS user will sell 200-000 fowl this year

Scores and hundreds—twenty thousand people in fact,—all over Canada, are following The Peerless Way to their profit. More than eleven million dollars' worth of eggs were sold in Canada last year. Yet with all this output prices stay high for every sort of good poultry and eggs. The market is far bigger than the present product—and it grows bigger day by day. Poultry-raising is the best business for any farmer, any farmer's child. Pays better for the time and money invested. Profit is surer. Isn't overcrowded—and never will be.

Poultry ought to be a side-line on every farm —

The poultry-crop is the one crop that never fails. Every farmer certainly ought to make poultry a side line, at least—it is a certain profit for him, no matter how bad a year he may have with his other crops. And the Peerless customer need feel no worry about finding a market for all he wants to sell in the way of poultry or eggs. We look after that for him. We find him a buyer who pays the best market prices in spot cash.

Your credit with us makes it very easy to start —

Your credit is perfectly good with us. You can equip yourself fully for successful poultry-raising, and you don't need ready money to do it. We trust you; and we will make the terms so easy for you that you will never feel the outlay. In fact a Peerless Outfit pays for itself and quickly, too.

Within a month or so from this very day, you could have a poultry-for-profit business well under way.

Write and ask us to prove to you that success with poultry, The Peerless Way, is possible for anybody of good sense in any part of Canada. Get the facts about it. They are facts that will probably be new to you. Send for them—it's for your own benefit we suggest that you send for them at once, without another day's delay. Just use a post card, if you haven't a stamp handy—put your name and address on it—say 'Show me'—that's all that's necessary.

LEE Manufacturing Co., Ltd.
118 Pembroke Avenue
PEMBROKE ONTARIO, CANADA

PEERLESS users get valuable help and service free—

Besides finding a buyer for our customers' poultry-products, (which we do free of any cost to you) our Board of Experts stands ready always to advise, counsel, help with practical suggestions free,—entirely so, to Peerless users. These practical men have developed the greatest poultry business in Canada—The Poultry Yards of Canada, Limited. Long experimenting in the hatcheries of this great plant brought the Peerless to perfection and proved it as the one successful incubator for use in every section of the Dominion.

More than 20,000 PEERLESS users are successful —

Poultry-raising with the difficulties taken out of it—that is the reason why The Peerless Way has proved profitable for over twenty thousand people, scattered all over Canada. There is not a reason on earth why it would not do as much for you as it has for the most successful of them. No matter where your farm is, you can do well the Peerless Way—and you won't have to depend much on plain farming, either.

Send right away for interesting offer and FREE very valuable information.

You will know why The Peerless Way is the way to get profit from poultry, once you have read our booklet and proposition that we want you to ask for. With that we will come an offer to equip you for poultry profit on terms that will suit your wishes and fit your means. Please write and ask for this now—make your start now—it will pay you to.

We carry ample stocks in our big distributing Warehouses at Winnipeg, Regina, Calgary, for the convenience of our Western friends. Address all letters to Head office, Pembroke, Ont. They will receive prompt attention.

The Care of New Born Foals.

(Continued from page 473).

in the stable. Navel infection is less liable to occur on grass, but this is possible and preventive treatment, therefore, is necessary, no matter where the foal is dropped.

TREATMENT OF THE FOAL AT BIRTH.

Attend to the navel cord (umbilicus) as soon as the nose of the foal has been cleared of afterbirth. If possible avoid tying the navel cord. It is best for it to break off naturally. If it fails to break and the mare is lying down, make her get up and the cord may then break.

If found necessary to tie the cord use a clean, disinfected string. A dirty string may cause infection. Soak the string in a five per cent. solution of lysol or carbolic acid, or a 7-500 solution of corrosive sublimate (bichloride of mercury). Tie the cord one inch or a little more from the belly; then sever the cord with a clean knife. An emasculator or ecaseur (castrating instruments) may be used to sever the cord in place of tying it and then cutting through below the knot.

Saturate the stump of the navel cord immediately whether tied or not, with the following disinfectant: Powdered corrosive sublimate, 2 drams; boiling water, 1 pint. When it has cooled, color the solution with 2 drams of tincture of iron, label the bottle "poison" and keep it out of the way of children. Repeat the application twice a day until the cord shrivels up, drops off and no raw spot remains. To keep the solution from blistering the foal's belly smear carbolized vaseline or unsalted lard around the navel before making the first application.

A good way to use the solution is to put some of it in a shallow, wide-necked bottle, then hold the bottle against the foal's belly with the navel stump immersed so that it will be completely covered by the fluid. If the navel cord has been tied remove the string as soon as possible, squeeze out the blood clot and instantly soak the navel stump with the corrosive sublimate solution. Use the solution twice a day until the navel is perfectly healed. Remove sloughing portions of the cord each morning, so far as possible, to allow the solution to wet all raw parts of the cord.

GIVE ATTENTION TO THE BOWELS.

A strong foal will be on its feet and trying to nurse in less than an hour from birth. Such a foal needs no help, but a weak one will have to be held up to suck until strong enough to do so without help. Wash the udder of the mare with a lukewarm 2 per cent. solution of coal tar disinfectant and then rinse off with warm water before the foal is allowed to suck for the first time. The external organs (genitals), tail and hind parts of the mare should be washed with a similar solution once a day for the first week or so after the birth of the foal.

Keeping the udder free from infective matter in this way tends to prevent the foal from scouring, for that condition of the bowels often is due to germ infection of the intestinal tract by way of the mouth. Disinfection of the navel cord also tends to prevent scouring. At birth the intestine of the foal contains a sticky mass of fecal matter (meconium). This should come away promptly and usually this is accomplished by the first milk (colostrum) which possesses purgative properties. To assist nature, either insert a small tallow dip candle (made for this purpose) in the foal's rectum, or, within an hour from birth, give an injection of either warm water, warm slippery elm bark tea, flaxseed tea, sweet oil, or a mixture of equal parts of cream, molasses and warm water, and repeat in 12 hours if required. Harm may be done by injecting a large quantity of strong, soapy warm water with an ordinary "horse syringe." A fountain syringe is to be preferred and small, hard rubber nozzle, or a small, clean rubber hose and funnel. Smear vaseline or lard on the nozzle and in rectum before giving the injection. If the bowels do not move within 24 hours from birth and the foal seems sick, shake up two to four tablespoonfuls of pure castor oil in milk, or a mixture of equal quantities of castor oil and sweet oil, according to size of foal, and give as one dose. Then continue the injection at intervals of six hours.

RAISING AN ORPHAN FOAL BY HAND.

In case the mare dies or has no milk the foal may be raised on cows' milk, if the attendant conducts the work patiently and intelligently. Choose the milk of a cow that has recently calved, preferably one which gives milk low in butterfat, for mares' milk while rich in sugar, is poor in fat. Sweeten the milk with molasses or sugar and dilute with warm water. Give a little of this prepared milk at short intervals from a scalded nursing bottle and large rubber nipple. Be careful to keep the bottle and nipple scrupulously clean. Add an ounce of lime water to each pint of the prepared milk and allow half a cupful once an hour at first.

As the foal grows, gradually increase the amount of milk fed and lengthen the intervals between meals. In a few days food may be given six times a day and, later, four times daily. The foal will soon learn to drink from a pail, if allowed to suck the attendant's fingers at first.

Until the bowels move freely, give rectal injections night and morning. If the foal scours at any time, give two to four tablespoonfuls of a mixture of sweet oil and pure castor oil shaken up in milk and stop feeding milk for two or three meals, allowing sweetened warm water and lime-water instead. Let the foal lick oatmeal as soon as it will eat and gradually increase the amount and add wheat bran. In five or six weeks some sweet, skimmilk may be given and the amount gradually increased daily until, in three months or so, it may be given freely three times a day in place of new milk. The foal at this age also will be eating freely of grass, grain and bran.

At all times supply pure cold drinking water. Let the foal run out in a lot or grass paddock for exercise. Accustom it to be handled daily. Feed small quantities of nutritious food often, keeping all food vessels clean and the foal should thrive and develop well.

We are Head to Foot Clothiers, "at a saving." We will send to your address, no matter where you live, anything from a Shoe String, to a complete outfit of Clothing. Write for our catalogue of bargains in Shoes and Clothing and free gifts to cash buyers. Mail orders shipped the day we receive them, and we pay all delivery charges on all orders of $5.00 or over.

We can save you money. Try us. —C. B. Pidgeon, Cor. Main and Bridge Streets, St. John, N. B.

Some Durability Facts For You

On account of the remarkable records for close-skimming that the **"STANDARD"** Cream Separator has established, it has become known as "The World's Greatest Separator." While we are proud of the **"STANDARD'S"** reputation for close-skimming, still we do not want you to lose sight of its other great features, such as:

The Enclosed Dust-Proof Gearing—The Self-Oiling System—The Low Supply Can—The Centre Balanced Bowl—The Liberal Space Between Disc Edges and Bowl for Holding Accumulation of Impurities—The Materials used in Construction of the Machine.

Standard

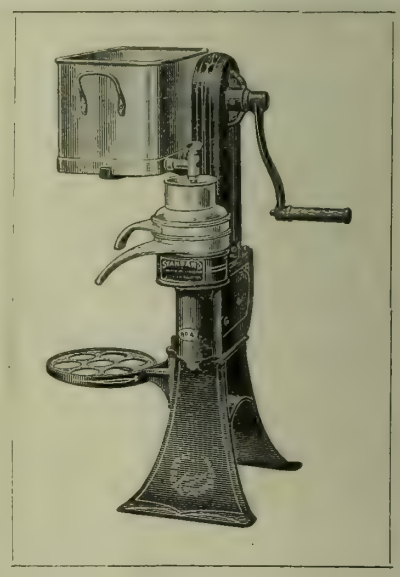
The materials used in the construction of a separator are very important. We could skimp, and build the **"STANDARD"** of cheaper materials. You would not likely know the difference. It would skim well too, but it wouldn't last nearly so long.

There is no separator in the world made from finer materials than the **"STANDARD,"** Every single part of it is made of the materials best suited for the purpose. For instance the gear spindles are made from a special grade of tool steel, ground and polished—a steel so hard and wear-resistent that tools are made from it for drilling through ordinary steel. This special tool steel costs five times as much as steel in ordinary separators, but ten ordinary steel spindles wear out before one **"STANDARD"** spindle.

The **"STANDARD'S"** Discs are made of steel, heavily and smoothly tinned. Stand on one and test its strength in comparison with aluminum or tinned iron discs. The Bowl Bottom is made from special steel forging. If the **"STANDARD"** bowl falls on the floor it won't bend or break.

The gears are machine cut. They are tested for accuracy on a special machine that can be adjusted to a 1-10,000 of an inch.

But why go further? You've learned enough to know that the **"STANDARD"** is built to last



long. And it has been given a test equal to skimming 100 pounds of milk every day for six years. At the finish there was no wear visible on the working parts. It was easily good for 20 years more. The test is fully described in our booklet. Write for a copy today.

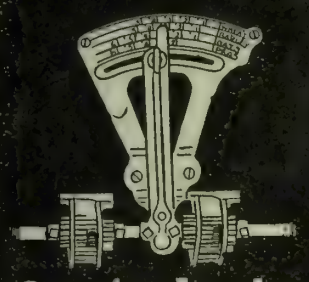
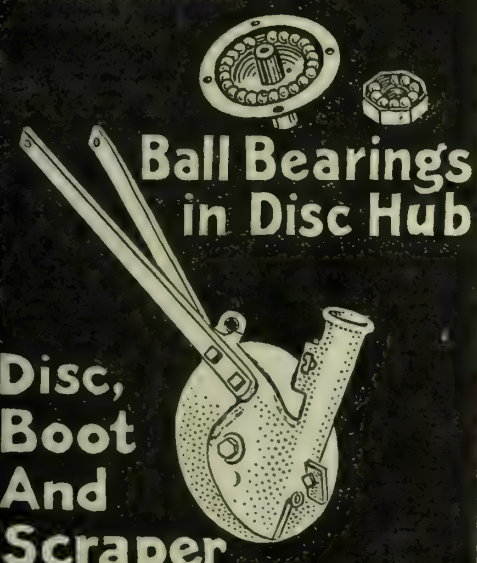
Sow Your Grain in Drills Get LARGER Crops More Profits

Sowing grain in the old style way is wasteful. While some spots get too little seed, most of the ground is generally too thickly seeded.

But sow your seed with the Champion Disc Drill and waste is eliminated. It sows with precision, just the right amount of seed in every inch of every furrow. The same amount of seed goes farther, produces larger crops and yields you more profits. The Champion way is the profitable way to sow your grain.





Frost & Wood

Champion Disc Drill

The Champion Disc Drill has made a great name for itself in "dirty" fields. Corn roots, tangled grasses and straw manure do not bother the Champion. It cuts right through the "meanest" field, sows the seed and covers it up.

The Champion is a wonderfully light draft machine. Instead of the usual iron to iron bearings at the hubs of the discs, the Champion has sets of dust-proof ball bearings. It's the only disc drill so equipped. This smooth-running, friction-reducing feature, together with no neck weight, make the Champion Disc Drill easier on horses than any other disc drill we know of.

The Champion Disc Drill is a strong substantial machine. It has a stationary axle to which the frame and grain boxes are solidly attached. It is built to give you many years of satisfactory service.

It is so built, too, that it is a pleasure to sow seed with it. There are no notches into which a shifting lever must be shoved. You can sow to a fraction of a pint by simply adjusting the Index. The Champion is thoroughly tested before it leaves the factory, and you are thus assured of getting perfect satisfaction when your Disc Drill bears the name "Champion."

We have a special Drill Catalog that we are waiting to send you directly we receive your name and address. Send us a card by next mail.

General Progress of the Annapolis Valley

(Continued from page 472).

vesting there will probably be thirty. A central association has also been formed.

The central association last year handled 300,000 barrels of apples in addition to those handled by the local societies direct. It now looks as if very soon practically the whole crop of the Valley would be handled through one central association, or through a number of central associations each acting for a number of contiguous local societies. The purchase of seeds, fertilizers, etc. is also being taken up by the co-operative organizations.

Along with these improvements in the apple industry have come very tangible evidences of progress. In the past fifteen years the yield has twice doubled. The half a million barrels raised in 1896 was the largest yield up to that time. The crop of 1911 was over two million barrels. If the same ratio of increase continues, it will mean four million barrels in 1918, or eight million in 1926.

Whether, or not these large figures will be realized time only can reveal, but a new spirit of progress and optimism is abroad among its people which promises great things for the Annapolis Valley.

Charlottetetown Market Report.

GRAIN—Oats, white, 50c. to 58c.; black, 55c. to 65c.

FEEDSTUFFS—Bran, $1.50 to $1.55; Shorts, $1.60 to $1.70; Middlings, $1.60 to $1.70; Oil-Cake, $2.50 to $2.75; Corn Meal, $2.00.

GRASS SEEDS—Timothy, 16c. to 20c.; Com. Red Clover, 25c. to 28c.; Mam. Red Clover, 25c. to 28c.; Alsike, 25c. to 30c.

LIVE STOCK—Butcher's Cattle—5½c. to 6½c.; Stockers, $18 to $35.00; Milch Cows, $24 to $45; Sheep, 4c. to 4½c.; Lambs, $3.00 to $3.75 each.

DRESSED MEATS—Beef (carcass), 8c. to 12cf; Beef (retail), 8c. to 16c.; Mutton, 9c. to 11c.; Pork, 8c. to 8½c.

HORSES—Drafters, $150 to $250; Roadsters, $150 to $250; Carriage, $150 to $250.

DAIRY PRODUCTS—Creamery Butter, solids, 33c.; prints, 34c.; Dairy Butter, 25c. to 28c.; Cheese, 15c. to 15½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 20c.; Fowl, 8c. to 11c.; Chickens, 10c. to 13c.

FRUIT—Apples, $2.50 to $4.00.

MISCELLANEOUS—Hay, $12.50 to $13.50; Straw, $6.00 to $6.50; Wool, 25c.; Beef Hides, 10c.; Sheep Skins, 65c. to 90c.; Lamb Skins, 15c. to 20c.

VEGETABLES—Carrots, 60c.; Potatoes, 60c.; Turnips, 17c.; Beets, 60c.; Parsnips, $1.25 per cwt.

Since our last report there has been some changes, especially in vegetables, the supply of which is limited, except potatoes which have been offering very freely considering the season of the year, the high prices having induced the farmers to bring them out but most of the receipts are still in the hands of the shippers here awaiting opening of navigation. The Minto opened the harbor here on Sunday last and boats are now running here regularly, which will have the effect of stimulating trade. Oats are coming in very slowly and the demand for seeding purposes has established a price beyond the value for shipping. We have quoted a wide range of prices which even the price shippers are willing to pay and prices being paid for seeding purposes, but these prices do not mean the prices charged for recleaned seed—true to name sold in a retail way by seed houses. Butter remains scarce and prices are firm but increased supply which may be expected shortly will cause a drop in value. The prices on eggs have held up remarkably well and demand is good at prices quoted.

The Maritime Farmer's Competitions

for the best articles giving practical experiences on the questions "How I Make a Profit with Sheep" and "How I Grow Potatoes on a Business Basis" which closed on March 20th, brought out some excellent practical, personal experiences. The first prize article in each competition is published on other pages of this issue. The other prize winning articles will appear later.

How I Make a Profit with Sheep Prize Winners are :

First prize, Mathew Lamont, Short Beach, Yarmouth Co., N. S. $25 00
Second prize, Andrew McPherson, Rocklin, Pictou Co. N. S..... .... $15 00
Third Prize, Donald Innis, Tobique River, N. B. .....$ 5 00

How I Grow Pptatoes on a Business Basis Prize Winners :

First prize, Fred C. Fawcett, Upper Sackville, N. B. $25 00
Second prize, A. E. L. Fritz, Lunenburg, N. S. $15 00
Third prize, John Howlett, Annandale, P. E. I. .... $ 5 00
Fourth Prize, James Howlett, Gowaen Brae, P. E. I. ..... $ 3 00
Fifth prize, H. R. Flemming, Debec. N. B. .... $ 2 00

We wish to thank the gentlemen, who responded to our offer as we feel that accounts of how they attend to details, in the succesiful management of their flocks and fields will be helpful to other readers of the Maritime Farmer.

St. John Market Report.

Beef, western, 9c. to 10½c.; Butchers beef, 8c. to 10½c.; Beef, country, 7c. to 8½c.; Mutton, per lb., 8c. to 9 c.; Veal, per lb., 8c. to 10c.; Lamb, per lb., 11c. to 13c.; Pork, per lb., 9c. to 9½c.; Cabbage, per doz., 70c. to $1.00; Lettuce, per doz., 40c. to 50c.; Eggs, hennery, per doz., 24c. to 26c.; Eggs, case, per doz., 22c. to 24c.; Tub butter, 22c. to 24c.; Creamery butter, 34c. to 36c.; Calfskins, per lb. 15c.; Fowl, per pair, $1.00 to $1.25; Ducks, $1.25 to $1.50; Celery, 80c. to 90c.; Calfskins, per lb., 16c. to 17c.; Hides, per lb., 11½c.; Turkeys, 27c. to 30c.; Maple sugar, per lb., 14c.; Maple syrup, per gal., $1.00 to $1.25; Turnips, 80c. to 90c.; Carrots, per bbl., $2.00 to $2.50; Beets, per bbl., $2.00; Potatoes, per bbl., $2.50 to $2.60; Lamb skins, 75c. to 90c.; Sheep skins, 80c. to $1.00.

SEEDS.

Timothy, Canadian, per 100 lbs., $19.50 to $21.00; Red clover, $24.00 to $26.00; Mam. clover, $25.50 to $27.00; Alsike clover, $22.50 to $24.00.

"The Man Who Makes Two Blades of Grass Grow, Where Only One Grew Before, is a Benefactor to His Country."

Every progressive farmer is a benefactor to his country.

Intensive farming must naturally follow increased values of farm lands, so that one acre can be made to produce what two acres did before.

Even greater increases than these may be obtained by the judicious use of fertilizers, containing a large percentage of Potash.

Write us for copies of our free bulletins which will instruct you how to fertilize economically.

Dispersion Sale of High-Class and Show AYRSHIRES

Having sold their Farm, Messrs JAMES BARRETT & SONS, will on

Wednesday, May 1st, 1912

At their farm **East ST. JOHN,** sell by auction their entire herd of **30 Head** of richly bred, heavy producing and Prize-winning Ayrshires.

As a result of careful breeding and selecting this herd is composed of some of as good specimens of the Ayrshire breed as may be found anywhere in Canada, many of them descending from the world's famous Nellie Osborne and the celebrated imported Bull Glencairn 3rd. There are also a large number of grand-daughters and grandsons of America's Champion Ayrshire Bull, the unbeaten "Barcheskie Kings Own" imp. They are certainly a grand lot of young animals, all out of Prize-winning and high producing dams many of them giving over 50 lbs. a day testing as high as 5.2. No animal in this herd over 7 years of age and all have the best of their lives ahead of them. This is a grand chance for breeders to select a winner for the fall shows. All animals in this herd tuberculin tested.

Cherry Bank Sunrise

On day of sale conveyances will meet intending purchasers at Street Car Line, Haymarket Square, every 15 minutes.

TERMS: Under $40, Cash. Over that amount Notes will be accepted with approved security, bearing interest at 6 per cent. for 6 months.

Sale will begin at 10.30 a.m. Luncheon will be served at 12.30

The richly bred stock bull, Cherry Bank Sunrise and the grandly bred yearling Bull "Springhill Prince," will be included in the sale. Among the cows included in sale is the choicely bred imported cow "Southwick Kate" who has given 40 lbs. milk a day testing 4.1 with first calf.

JAMES A. TELFER, Markhamville, N. B.,

AUCTIONEER.

Catalogs on application to JAMES BARRETT & SONS, East, St. John P. O., N. B.

Picking Apples.

Editor Maritime Farmer:—

I have been a dealer in apples for quite a number of years and during that time many cases have come to my notice of people who do not know when this king of fruits should be picked. Sometimes we find apples that are almost worthless owing to the fact that they were picked either too early or too late.

Although I am the largest grower and shipper of apples in the County of Lunenburg and have talked and advised the growers of this County personally and through the public press still I find that a great many are inclined to follow the haphaszard system.

A few months ago a certain buyer was buying a lot of apples in the Annapolis Valley. He met with a fruit grower who had picked too soon and found that the apples he was offering for sale were too green and consequently he would not buy them.

W. A. Hebb.

A prominent farmer and fruit grower, Lunenburg, N. S. He is also an accomplished musician and leader of the Lunenburg Brass Band.

Fruit growers who make mistakes of this kind must suffer great losses which they try to alleviate by palming off inferior stock on some one who does not know his business.

A brown or green Baldwin is flat, bitter and a mean tasting apple. If the tree carries too much wood, it should be pruned and the apples should remain on the tree until the underside or green side, turns from green to a lighter tinge or cast.

Spies, in most cases, should not be picked until they begin to turn as mentioned above.

Ribstons should be picked early or they will deteriorate on the tree and in a very short time become very inferior.

Golden Russets should be picked fairly early and kept covered from the air as they wilt if long exposed.

In picking Kings and Spies it is best to pick off the outside and top of the tree first and then wait about a week and go over the trees again, when the remainder of the fruit will be much improved in color. In some cases it is advisable to leave the greener apples for a third picking. In this way they will all become of fair color and will grade a greater percentage of No. 1's.—W. A. Hebb, Bridgewater, N. S.

The Dairy Courses at the Provincial Dairy School, Sussex.

The Course for Butter and Cheese Making at the Provincial Dairy School Sussex, closed on April 12th. In all there was an attendance of twenty-five, a number being from Prince Edward Island and Nova Scotia. Eleven ladies attended for Butter-making and Soft Cheese-making.

A Butter-making Course framed to meet the requirements of farm dairies is being considered for next Autumn. It is during the winter season that most of the churning difficulties are experienced, and as a course in the fall would supply an opportunity for preparatory work, it is felt that this departure would be warranted.

An incident of this season's course that was of considerable interest was the trial of a hand cream separator supplied by a dairyman. The dairyman had not been able to make the separator do satisfactory work even with a new bowl supplied by the manufacturers of the machine.

The separator was subjected to tests that embraced: Separating at different temperatures; separating at high, medium and low speeds; separating at rich and poor cream adjustment and separating at full and reduced capacity. In the main the results obtained justified the conclusion of the dairyman that the machine would not do satisfactory work. It would seem again necessary to repeat our advice that dairymen purchase hand cream separators only on condition that they do satisfactory work.

Echoes from the 1911-12 N. S. A. C. Session.

The 1911-12 session at the Nova Scotia Agricultural College closed on Friday, April 12th. The session has been by far the most successful in the history of the institution, the attendaace in the regular course having been 80 in comparison with 65 the previous year, and the Short Course 342 in comparison with 230 the previous year. The examination results have not yet been published, but on the concluding day two Cups, awarded for proficiency in Live Stock Judging, were presented. The Cup presented by the Hon. G. H. Murray, Premier of Nova Scotia, for the best all round judging of live stock, was won by H. S. Cunningham, of Tatamagouche, Colchester County, a Senior student, with Vernon Durling, of Lawrencetown, Annapolis County, a very close second. The Cup presented by the Prince Edward Island Short Course students of 1911, for the best judging of seeds, was awarded to Ora C. Hicks, of Petitcodiac, N. B.

In order to accomodate the increasing number of students at the College, considerable additions will be made to the institution during the ensuing summer. An addition will be added to the main building, which will increase its capacity about two-thirds. A separate Horticultural building and green houses will be erected during the summer.

It is extremely satisfactory to note the progress that has been made at this Agricultural College of the East, not so much because of the institution itself, but because it is indicative of the new interest in Maritime Agriculture, which spells a new life in these Eastern Provinces of Canada.

The small farm that produces up to the limit is better than the large farm that yields only half a crop.

The up-to-date farmer is always busy laying his plans ahead, no matter whether it is summer or winter coming.

The social life of the community may well center round the district school.

Condiments that stimulate egg production are very much like anything that stimulates a human being. After the immediate results wear off the bird is in the worst shape than before being fed.

SIMMERS' Collections of Garden SEEDS

NOTE—They are free by mail on receipt of price.

These Collections contain ONLY TRUE AND TRIED KINDS

Considering the extremely low rates we cannot possibly permit any change in the varieties.

THE "CITY AND SUBURBAN" CARDEN COLLECTION

Price $1.00. Free by Mail

$1.00 Contains 17 Distinct Varieties of Vegetables

Beet—Blood Turnip, 1 pkt.
Beans—Dwarf, yellow wax Pod, 1-2 pint.
Cabbage—Early Jersy Wakefield, 1 pkt.
Carrot—Scarlet Horn, 1 pkt.
Corn—Early Sugar, 1-2 pt.
Cucumber—Long Green, 1 pkt.
Lettuce—Cos. 1 pkt.
Lettuce—Nonpareil, 1 pkt.
Onion—Yellow Danvers, 1 pkt. Mammoth Silver King, 1 pkt.
Parsley—Triple Curled, 1 pkt.
Peas—(None of which require staking) American Wonder, 1-2 pt.; Strategem, 1-2 pt.
Radish—Scarlet Olive, 1 pkt.
Squash—Vegetable Marrow Bush, 1 pkt.
Tomato—Imperial, 1 pkt.
Turnip—Snowball, 1 pkt.

FARMERS' VEGETABLE COLLECTION

Price 75 cents

75cts Contains 1 ounce Beet, 1 pound Beans, 1 ounce Carrot, 1 pound Sweet Corn, 1 packet Cucumber, 1 packet Lettuce, 1 packet Watermelon, 1 packet Citron, 1 ounce Onion, 1 packet Parsnip, 1 packet Radish.

GARDEN COLLECTION No. 2

13 Packets for 50c.

50cts. **Beans**-Simmers Giant Wax.
Beet — Blood Turnip.
Carrot—Scarlet intermediate.
Corn, Sweet—Cory.
Cucumber—White Spine.
Cabbage—Vandergaw.
Celery—White Plume.
Lettuce—Simmers' Nonpareil.
Onion—Large Yellow Danvers.
Parsnip — Improved Hollow Crowned.
Parsley—Champion Moss Curled.
Peas—American Wonder.
Radish—Olive Scarlet.
Flower Seeds and Packet mixed Annual.

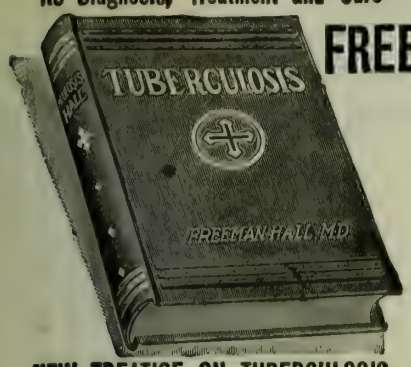
Consumption

Its Diagnosis, Treatment and Cure



FREE

NEW TREATISE ON TUBERCULOSIS

By FREEMAN HALL, M.D.

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you. Even if you are in the advanced stage of the disease and feel there is no hope, it will instruct you how others, with its aid, cured themselves after all remedies tried had failed, and they believed their case hopeless.

Write at once to The Yonkerman Co., 1709 Rose St., Kalamazoo, Mich., and they will gladly send you the book by return mail Free and also a generous supply of the New Treatment absolutely Free, for they want you to have this wonderful remedy before it is too late. Don't wait—write to-day. It may mean the saving of your life.

FREE GIRLS

Girls, Here is Your Chance to Obtain FREE a Handsome Bisque DOLL Do you want to receive *Free* a beautiful doll? We have them for you. Our large handsome doll will sit down, fold its arms, turn its head, shut its eyes and go to sleep like a real baby, the best kind of a doll, 18 inches tall, with long curly hair, real eye lashes, handsome turning Bisque head, full jointed body, pearly teeth, very stylishly dressed, fancy underwear, with hat, shoes, stockings, etc., dressed completely from head to shoes, *free* to you for selling only 15 packages of our famous Marvel Bluing at only 10c per package. We send a beautiful finished Turquoise Brooch to give to every customer who, buys a package from you. This makes them sell quickly

Return the $1.50 when sold and we will promptly send you this handsome doll. Write to-day Address Dept 77

MARVEL BLUING CO., TORONTO, ONTARIO, CANADA

The All Canadian Route to Montreal.

Via the Intercolonial Railway Maritime Express is the only All Canadian Route to Quebec and Montreal from the Maritime Provinces. The Maritime Express is generally admitted by experienced travellers to be the most comfortable train in America. This is especially true in regard to the dining and sleeping car service. The diners of the I. C. R. are roomy and well ventilated and furnished in the best of taste. The excellent meals are served Table d'hote at a price away below the a la carte rates prevailing on the company owned lines. The sleeping coaches are up to date in every particular, and the smoothness of the road bed makes the long journey easy and pleasant. Being popular with a class of travellers who are generally found to be the acme o' good company the through journey is never found dull, and even during the winter months there is much of scenic interest in the day's ride through the Province of Quebec. Montreal is reached at the convenient hour of 6.30 p.m. and connections are made at Bonaventure Union Station with the through trains of the Grand Trunk Railway for Toronto, Buffalo, Detroit, Chicago, and other points in Western Canada and the United States.

The Worthy Son of a Worthy Sire.

On another page of this issue will be found a cut of the Jersey Bull, Foxhall St. John 'O Dreamwold owned by Messrs. Josselyn & Young, Silver Falls, N. B.

Foxhall St. John 'O Dreamwold is a grandson of the famous Flying Fox, the first Jersey bull on record to sell at public auction for the snug sum of $7,500. Following are some of Flying Fox's achievements in breeding and showring circles.

Flying Fox No. 61441 was imported as the 1899 first prize winner over the Island of Jersey. He was sold at auction in 1902 for $7,500 to T. W. Lawson, of Boston, Mass., in whose possession he remained until he died on December 6th, 1909, in his 12tn year.

He sired the great bull "Oxford Lad" P. 3123 H. C., winner of the first prize at St. Saviors in 1902 and sweepstakes at St. Saviors and Growille and State prize over the Island in 1903, and sold at public auction for $3,300.

He also sired Stockwell, 3550 H. C. Stockwell sold at public auction for $11,500. He sired Brookhill Fox, 65303, also, champion winner in England as, a yearling, and leader of all the imported bulls at the World's Fair in 1904.

Fox's Flower 'o D, the greatest cow in America to-day, was sired by Flying Fox.

His get has won many firsts all over the United States and a number of his daughters have already made great tests.

His get won first and champion honors in 1902 and 1903 at the Royal shows, on the Island of Jersey and England and at Toronto, also at Kentucky, Minnesota, Wisconsin, West Virginia, Maine, Massachusetts, Illinois and Missouri State Fairs. At the last World's Fair in bull and progeny class of 23 entries, Flying Fox's get won 2nd, 3rd and 4th and at the great Brockton Fair in 1911 his get won 1st, 2nd and 3rd. At the same Fair his get won the Jersey special for four cows, in milk, bred by ex. hibitor and the same get won 1st at the great National Dairy Show at Chicago in 1911.

Fox's get has done more than that of any other bull by winning 1st at the Dairy shows East and West in the same year, winning at the Brockton Fair, in 1910, $669.00 out of $1000.00, in hot competition.

In 1911 his owners won at the Brockton Fair $639.00, which is more than any other exhibitor did, winning all herds. Out of 120 head shown at Brockton 95 per cent were descendants of Fox's descendants.

At the National Dairy Show in 1911 the same per cent. were of Fox blood. Champion Flying Fox is also the grand sire of the famous bull Noble of Oakland, P. 3909 H. C., that sold for $15,000 on Decoration Day, 1911. He is also the grand sire of Gamboy's Night, 95698 A. J. C. C., that sold at the same sale for $6,700.

He also sired the famous Flying Fox's Foxhall 61435 A. J. C. C., that was picked out by the Jersey Cattle Club to be used on the cows in the Dairy test at the great St. Louis Fair in 1904. Flying Fox's Foxhall is the sire of the famous bull Foxhall St. John 'O Dreamwold, whose dam is Golden Bess of St. John, winner of the Parish prize in 1899 and winner of 1st prize at St. Peters show in August 1900. Golden Bess also won 1st with her progeny at the great St. Louis Fair. T. W. Lawson paid $1600 for her at public auction in 1902. She is a magnificent dairy cow with large beautiful udder and well placed teats. Last year she gave over 10,240 lbs. milk average 5.4 per cent. butter fat. She dropped a beautiful bull calf in December 1911 and is now in her sixteenth year.—P. H. Robinson.

An I H C Manure Spreader a Necessity on Every Farm

IF you expect to continue farming and raise a paying crop every good year, you must arrange to return to the soil the plant food taken from it by growing crops. Neglect is bound to decrease the productivity of your farm, and, in the end, to ruin it. When a farm is once run down it takes years of slow, careful upbuilding to bring it back to its original fertility.

If you attempt to fertilize by spreading manure with a fork, you fertilize unevenly and waste fully half the manure. When you use an I H C manure spreader properly, the fertility of your soil remains at a constant standard, while its physical condition improves from year to year, assuring bumper crops in good years, and the best possible stand when weather conditions are unfavorable.

I H C Manure Spreaders Corn King and Cloverleaf

will spread manure as it should be spread; in an even coat all over the field, light or heavy as may be needed, and pulverized so that the plant food elements in it combine with the soil.

An I H C spreader has many mechanical advantages. The apron moves on steel rollers running on steel tracks. This construction reduces draft and prevents the apron from slipping under the load. The apron feed mechanism and beater gears are provided with shields which protect them from sleet, snow, and manure. A strong, durable feed moves the apron steadily toward the beater at any desired rate of speed. This steady movement insures even manure spreading whether the spreader is going up hill or down

Compare the I H C apron feed mechanism with that of any other manure spreader and see how much stronger and more positive it is. I H C spreaders are so constructed in every detail that they do their work positively, with the least effort on the part of driver or horses.

I H C spreaders are made in different styles and sizes, for use in orchards, vineyards and gardens, on small and large farms. The I H C local agent will show you the machine best adapted to your needs. See him for catalogues and full information, or, write nearest branch house

TRADE MARK REG.

SHEATHING FELT

Makes Houses Snug and Warm

"Sovereign" Sheathing Felt compared with ordinary building paper is like a woollen blanket compared with an ordinary cotton sheet.

"Sovereign" Sheathing Felt is made partly of WOOL, saturated and coated with the same tasteless, odorless gum that gives **Ru-ber-oid Roofing** its recognized superiority. It does more than break the wind—it acts like a blanket in the wall, and prevents the heat from leaking out in winter or filtering in in summer. As a result it makes a substantial saving in your winter coal bills and adds to your summer comfort.

"Sovereign" Sheathing Felt is waterproof—will not mould, rot, dry out nor crack, and is strongly fire-resisting.

Get a sample of "Sovereign" from the nearest Ru-ber-oid Dealer, or write us for sample and Booklet.

THE STANDARD PAINT CO. OF CANADA, LIMITED

MONTREAL. WINNIPEG. VANCOUVER. 91

N. B. F. & D. A. County Vice Presidents' Reports.

(Continued from page 479).

The oat crop gave a good average yield of good quality.

Buckwheat was a fair average crop, but not extensively sown.

The potato crop was about one-half the average crop, owing to rot and wet weather.

Turnips were an average crop.

Other root crops were good.

The apple crop was good.

In regard to horses, we are in need of a good general purpose horse for farm and road work.

Our cattle could also be improved by importation of some good large stock, more especially the beef type. —Eben Ferguson.

ST. JOHN COUNTY.

I hereby beg to submit my report of the conditions in ST. JOHN, COUNTY, regarding Agriculture, Live Stock, etc., for the year 1911.

After a moderately cold winter, spring opened fairly early and seeding began about April 25 th. The weather was excellent for seeding, but much too dry for grain and grass to make much headway, and as a result Stock were later being put on pasture than for some years.

Hay was a good crop, but much below 1910. Roots of all kinds, potatoes and small vegetables were much above the average.

Through the efforts of our Agricultural Society for the City and County of St. John, a quantity of Alfalfa Seed was procured and a large number of the members have sowed and grown Alfalfa in St. John, in 1911, with very encouraging results. While we had a splendid catch it depends on how the plant survives in the winter whether it can be grown successfully or not.

Our St. John City and County Agricultural Society held its annual Fair on the Moose Path Trotting Park on Sept. 25th' and it was one of the most successful yet held by the society. Some fine herds of Ayrshires and Jersey Cattle came out in competition; no beef cattle were shown. Three prizes were given in each section and in many cases decisions were given on fine points. Horses were also out in large numbers and of very good quality. A feature of the Horse Classes being in the driving section when some beautiful turnouts were in audience.

Hogs also made a fine showing, Pure Bred Yorkshires predominating. A very regrettable feature of the Fair was the absence of any kind of Sheep, this is the first time Sheep were not shown at a St.John Fair.

Henry Glendinning of Ontario placed the awards in all the Live Stock Classes and gave fairly good satisfaction. After having judged the Live Stock in Fredericton and having attended most of the Big Exhibitions in the Maritime Provinces, Mr. Glendinning declared the stock he judged at St. John Association Fair were as good and in some cases superior to those he had seen at the large exhibitions in the Maritime Provinces.

The Dairy Products were judged by Mr. L. C. Daigle and were pronounced as excellent. Poultry also made a fine showing. St. John County can boast of some of the best Poultry in the Maritime Provinces. Fruit was also a very interesting feature and the specimens of Apples shown, proved beyond a doubt that St. John County is admirably adapted for orcharding.

Another interesting feature of our Fair was the Domestic Science Department. Some very fine exhibits of cooking preserving and fancy work were here displayed. This is a very interesting department of our exhibitions and the ladies deserve credit for making it a huge success, and also for the skilful exhibits that were to be seen in this department.

On the whole our Fair was a grand success, and I feel assured if each Agricultural Society in New Brunswick would hold Fall Fairs it would stimulate an interest among the farmers of the district and surrounding country and should have every encouragement from the Provincial Department of Agriculture. I may add that although many new Societies have been formed during the past few years in New Brunswick, the grants to those Societies are so small as to render it almost impossible for much progress to be made in the upbuilding or improving of Live Stock, especially Dairy Cattle and Sheep in those districts where the Societies are established and as a result the farmers do not see anything to arouse their enthusiasum as suould be the case.

I would suggest that the Farmer's and Dairymen's Association use their best efforts to impress upon the Departmeut of Agriculture the importance of making a special grant every year to the Socities in districts, where the dairy cattle and sheep need to be lifted up to a level that would make them return some profit to the farmer who depends upon them for his living. This grant to be used exclusively for purchasing good Pure Bred Stock.

Encouragement is what farmers need the most, and there is nothing I know of that will encourage a farmer more than to see his stock improving and becoming more productive and every year giving him larger returns for his labor. There are too many farmers throughout New Brunswick who labor year after year trying to make a living by working hard feeding and milking from five to fifteen or twenty cows that are hardly paying for their feed let alone returning a profit for his labor, where if by some generous assistance on the part of the Government and a little enthusiasum on his own part the farmer should in two to four years hence be making more butter, producing more milk and as a result making a good profit which he is unable to make under present conditions, and from half the number of cows he is keeping at the present time. There are many other branches of live stock, Horses for instance, that need improving upon, but none that in my mind need attention so much as do Dairy Cattle and Sheep in this Province.

There is no doubt that we have some of the finest Herds of Ayrshires, Jerseys and Holstein Cattle in New Brunswick that can be found anywhere in Canada, but, they are confined to only certain districts in certain counties and how easy it is to tell when passing through those districts that good stock is being kept.

You will note the beautiful green fields, with their splendid crops of waving grass and grain, turnips and corn which is evidence that the cow is there to keep up the fertility of the land.

The enthusiastic farmer has his buildings neat and clean outside and in. The paint and whitewash brush has not been spared and the buildings and fields and beautiful herds and flocks as they graze on the pasture, show every indication that they are paying their owner for his labor and a good interest on his investment.

Success in farming depends on the fertility of the land being kept up.

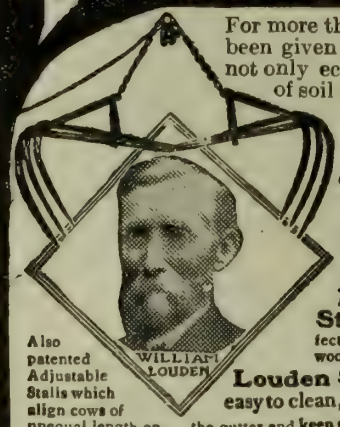
The lands must produce more crops, and I am firmly of the opinion that the only way to do this is to get the farms well stocked with the kind of stock best suited to the district in which any certain branch of farming may be carried on, and those crops consumed by the stock kept on the farm as far as is practicable.

Too many farms in New Brunswick depend too much on commercial fertilizer to get a crop from their land, but this is too expensive and many of our New Brunswick farmers cannot afford to purchase those high priced fertilizers and have a profit from their crops. All this is not necessary when we keep our farms well stocked with a good class of live stock.

Too much butter and cheese, beef, mutton and eggs are being imported into New Brunswick every year. This is important in order that the wants of the people may be supplied; but why should not New Brunswick supply her own needs in those necessities?

There is no province in Canada better adapted for supplying her own needs in hose necessities than New Bruni wick,

Louden Perfect Barn Equipments STOP WASTE



For more than 45 years our best thought and energies have been given to the problem of stopping waste on the farm—not only economy of time and labor, but also conservation of soil fertility.

Our first patented device was a crude wooden hay carrier produced in 1867. From this beginning there has been developed and perfected

The Great Louden Line of Barn Tools the most perfect, efficient, and economical ever devised—KNOWN AND USED ALL OVER THE WORLD.

Louden Flexible Tubular Steel Cow Stanchions keep the cows lined up but allow perfect freedom of movement and comfort. Can be hung on homemade wooden frames.

Also patented Adjustable Stalls which align cows of unequal length on pens, self-cleaning steel mangers, etc.

Louden Sanitary Steel Stalls are made of tubular steel, easy to clean, keep the barn light, perfectly ventilated and sanitary. the gutter and keep them in line; patented adjustable stanchion holders; bull and calf

Louden Feed and Litter Carriers of galvanized sheet steel, running on overhead tracks. Reduce the time and labor of chore work one-half to three-fourths.

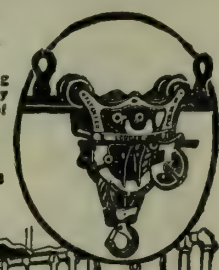
The LOUDEN LINE includes also, Louden Hay Tools; Louden's Bird Proof Barn Door Hangers; and all fittings and accessories for completely equipping barns of every size.

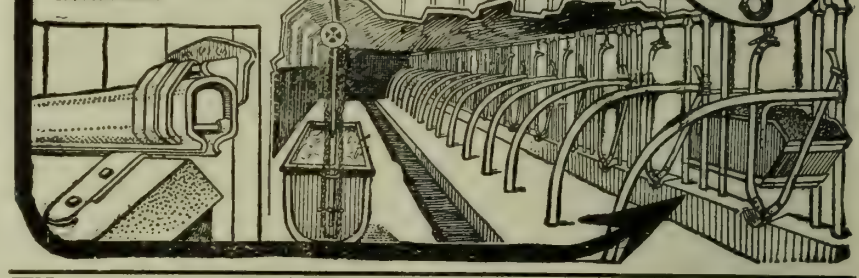
Let them make you money by making your cows give more and richer milk, and by saving time and labor—every hired hand saved, means $400.00 or more per year, which is 8% interest on $5000.00. And they will last longer and give better service than any other Barn Tools made.

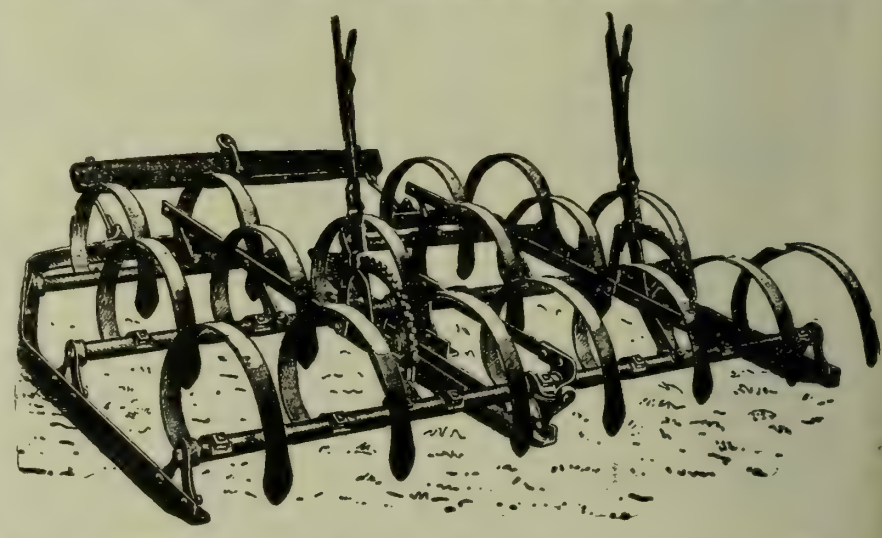
Patents—All Louden Tools are built under original patents covering all essential features. We guarantee our tools to be free of infringement on any patents owned by others. We guarantee to hold each and every purchaser of LOUDEN goods safe from all harm or damage from infringement claims.

Send sketch of your barn plan and we shall advise you what equipment you need. We shall also tell you what the cost will be. Send for our Catalogue "Everything for the Barn". Write to-day. See the Louden line of Barn Tools at your dealers.

Louden Machinery Co.,
Dept. 415 Guelph, Ontario.







HARROWS The above cut shows a harrow which has proven itself absolutely to be the best working Spring Tooth Harrow on the market to-day. It is built of the highest grade material throughout. It will hold steadier to its work and do more effective work and deeper when desired than any other. With the levers the depth can be regulated instantly while in work, thus easing the draft on the team at first and getting deeper cultivation without increasing the draft at the final scrape.

Every farmer who needs a harrow will look after his own interest well by buying a **BAILEY-UNDERWOOD LEVER.**

Made in sizes 9 and 11 Tooth, Single Section. 15 and 17 Tooth, Double Section.

BAILEY-UNDERWOOD CO., Limited. New Glasgow, N. S.

An advertisement in the Maritime Farmer will sell your surplus stock---Try it !

and still we hear of New Brunswick im porting those necessities with which she should supply her own people, from as far away as Austrslia and New Zealand.

What will New Brunswick do in the matter of food stuffs when the population increases as we expect it to increase in the next five or ten years?

The farmer should wake up and the Farmers and Dairymen's Association will have to wake up and get after the Provincial Department of Agriculture to give there utmost assistance in advancing the farming industry in New Brunswick as quickly as possible.

Within five or seven years St. John will have almost have doubled in population. Fredericton, Moncton, Woodstock, Chatham and all those other cities and towns in New Brunswick will increase in population accordingly. What is New Brunswick going to do to meet the demands made on her for Dairy and Farm products for this increased population?

I would suggest that an Agricultural College and Demonstration Farm be established in New Brunswick. I feel convinced that when such a College and Farm for demonstrating just what can be accomplished in farming when practical methods are applied that our farmers will become practical. I believe many would attend such a College if we had one in New Brunswick that will not go to Truro while some of our young men will travel to St. Anne DeBelleveu to acquire a practical knowledge of farming.

I would suggest that the Farmer's & Dairymen's Association appoint a commitee to wait on the Government and urge them to establish an Agricultural College and Experimental Farm in New Brunswick,

I may say that I would not advise a farmer to wait until an Agricultural College has been established in order to acquire a knowledge of farming, There is another source through which a farmer can become quite practical in his profession. I refer to the reading and putting into practice of what is put before the farmers and stockmen in the columns of our Agricultural Papers.

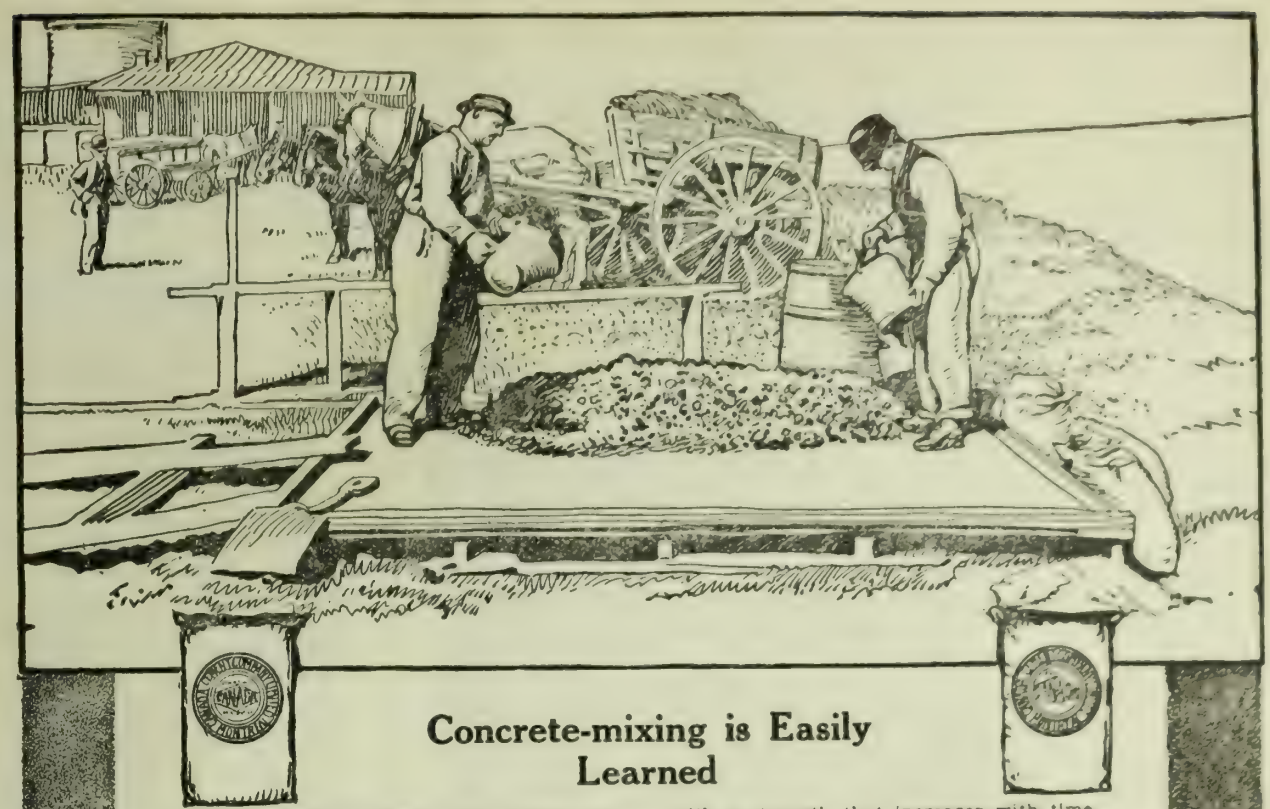
Every farmer should be a subscriber to some good farm paper and by concientiously reading and putting into practice what is put forth in the columns of any of the leading agricultural journals, he will gradually become practical in his methods even before he can realize it. And his evenings may be spent to good advantage if instead of reading some worthless novels or daily papers, he would sit by the fire and educate himself to be practical in nearly every branch of farm work as it is advocated in those good Farm Journals.

I feel if some of my suggestions would be carried out that Agriculture and Live Stock would soon show a marked improvement. Farmers will learn to be more practical and New Brunswick will become what she was destined to be, second to no other Province in Canada—John P. Barrett, East St. John. N. B.

SUNBURY COUNTY.

I cannot help feeling a certain amount of pleasure in presenting you the report for the County of Sunbury. While it is the oldest and at one time the largest County in the Province, it has been so carved up that with the exception of St. John it is the smallest in area and is the smallest in population; but Gentlemen, it is within the boundaries of this little County in the parishes of Maugerville and Sheffield that one of the first English settlements was established.

While in attendance at the Congress, held in this City a few days ago, I could hardly keep my seat while delegates from different sections arose and in turn of eulogy recommended their several localities as the one place most desirable. Now Mr. President and Gentlemen I am going to have my innings. In our fair County we have some of the very best intervale farms in the Province, which are not only unsurpassed for the raising of hay and all kinds of vegetables,



Concrete-mixing is Easily Learned

IT is no more difficult than mixing bran mash, once the simple instructions have been read.

The materials—sand, crushed rock or gravel and cement—each play a separate part. The rock provides the bulk of volume at very low cost. The sand fills in all crevices between the pieces of rock or gravel. The cement, mixed with water, forms a "bond," in other words a rocky "glue," that binds the other materials firmly together with a strength that increases with time.

Concrete is really artificial rock, more firmly bound together than natural rock, which often has cracks, veins, fissures and other weaknesses.

Any farmer can learn how to mix Concrete and to apply it to the hundreds of uses to which it is fitted.

But in order to be absolutely sure that his proportions are correct and that his materials are properly suited to the purpose, he should send for the book,

"WHAT THE FARMER CAN DO WITH CONCRETE,"

and read the careful directions for mixing Concrete for all purposes. It also describes in detail hundreds of ways in which Concrete may be used to make the farm more comfortable, more convenient, more profitable and more valuable.

Just send us your name and address—in a letter or on a postal—and the book will be sent to you by return mail free. Address

BELLEVUE STOCK FARM.

Bellevue won male and female championships and all the herd prizes in Shorthorns at the 1910 fairs. The championship for Ayrshire bull has been held by us for three years with our Morton Main's Gerthrope, an Osborne bred bull. All our prize winners, with the exception of our herd bulls were bred by ourselves. Write for prices or call and see us. We breed our winners and sell them too.

C. A. ARCHIBALD, Proprietor, TRURO, N. S.

You will look a good while before you find a better medicine for coughs and colds than Chamberlain's Cough Remedy. It not only gives relief—it cures. Try it when you have a cough or cold, and you are certain to be pleased with the prompt cure which

but cannot be beaten in most respects for market gardening, and some of our intervale farms have excellent orchards which are doing splendidly when taken proper care of. Now right here I will give a few of the reasons for the great fertility of our soil. In the first place our soil is all what we call made land, consisting of the annual deposit from the river St. John. Some present may question this, but I think I can give ample proof for my ascertion from the fact, that in digging a well on my father's farm, we came to a deposit of rushes at a depth of over twenty feet, which when uncovered looked as natural as if they had only been growing the year before. Of course they disappeared almost as soon as they were exposed to the air.

Another source of fertility is the annual overflow which still covers the lower portion of our farms during the early Spring, and leaves a deposit which enriches the soil very materially.

Some present may ask: "Why is your whole County intervale?" Not by any means. We have some most excellent upland farms. I think the equal of any in the Province, which are eminently fitted for the raising of potatoes and all kinds of grain; also for the growing of apples; and Gentlemen let me tell you right here that I do not think it will be many years before the St. John River Valley Fruit Farms will be as noted as the Annapolis Valley ones are at present.

As to the crop report for the present year, I would say that with the two exceptions of buckwheat and potatoes, our crops were about average. Buckwheat being away below and potatoes far above, for taking 60 barrels as an average yield per acre, in some instances they went as high as 125 and in one case a farmer told me his whole crop was yielding at the rate of 150 barrels. Now I will take 100 per cent. as representing a full crop and will give you the averages as nearly as I could ascertain and although they may not be strictly accurate, I think you will find them fairly so.

Potatoes	100	per	cent.
Turnips	90	"	"
Carrots	85	"	"
Beets	90	"	"
Mangels	90	"	"

Cucumbers (for pickles) (low average due to bad seed furnished by factory).	50	"	"
Onions	90	"	"
Tomatoes	90	"	"
And other garden truck about	90	"	"

—Ashley Harrison.

VICTORIA COUNTY.

The general character of the past season has been very favorable for doing farm work. The last part of April the snow was all off the ground.

The first part of May the farmers commenced to put in their crop.

The hay crop was early and 80 per cent. of an average crop, but housed in a good condition. Berries were plentiful in this upper county, more so than they have been for a good many seasons.

Grains, of all kinds, yielded about average crops. Potatoes turned out from 80 to 100 bbls. of good quality per acre.

There are four Agricultural Societies in Victoria County, which have formed a seed fair association and will hold a seed exhibition this Spring, in the town of Perth, on the 4th day of April, for the purpose of securing good seed, and also to encourage the farmers in the selection of good seed.

The apple crop was about an average.

I would suggest that the Farmers' and Dairymen's Association urge upon the local Government the neccessity of establishing a cheap money rate, to assist in the colonisation of the Crown Lands.—Carl O. Hansen.

YORK COUNTY.

In drawing up this short report on the condition of this County from the agricultural standpoint, it has been brought to my notice that there is a need of some regular correspondence between the more progressive farmers in different localities in regard to the overcoming of climatic conditions by artificial means, the return from their crops, and their different experiments in farming and stock raising along scientific lines. For lack of this, my report must be more or less of a very local nature, and the smaller the locality, the less valuable are the observations however accurate they may be.

Generally speaking the farmers have had a fair return for their labours this past season. Owing to an early drought the grain crop, especially the buckwheat, has not been up to the average in this County, but the market has been strong and the crop on the whole has been profitable.

Handling, as I do a good deal of oats for sale, I have noticed that western oats can not compete with ours in open market, owing to the noxious weed seeds and dirt in almost every sack imported. Many parts of this County grow excellent wheat, but it is of little value to the farmer in nearly every instance, because there is no mill to grind it. In the Stanley—Nashwaak district I have seen considerable excellent wheat cracked for feed this past year on this account, and the farmers in that locality should endeavour to obtain the government subsidy and have a mill erected at once.

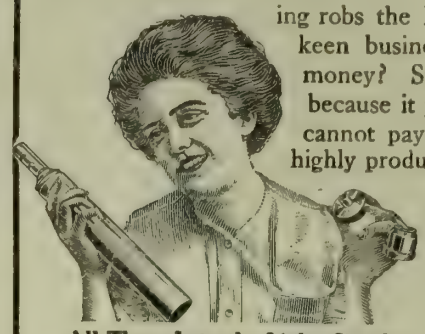
The root crop has been slightly below the average the past year as has also the potato crop, but with the latter this was more than compensated for by the excellent market, potatoes in many places selling from $1.30 to $1.50 per bbl. from the field.

Many farmers in this County were not in a position to reap the large reward which might have been theirs from the phenominal apple production this last year. On account of lack of scientific growing, packing and marketing of our apples, we were not able to compete in the market with the growers in Nova Scotia and Ontario who use more up-to-date methods. I sincerely hope the farmers in York County will give this interesting and lucrative branch of their work more careful attention in the future and confidently predict that many sections in this County will be found to be second to none in Canada as apple producing localities.

The hay crop this past season has been well above the average, and in conclusion I wish to point out one more instance where I believe the farmers in York County allow money which should be theirs, slip through their fingers. This past season I have bought and shipped upwards of one hundred carloads of hay, paying $9.00 and $9.50 per ton for the same. This is only a small fraction of the hay exported from the County. At the same time we are importing carload after carload of beef at a high price. I believe our hay is worth more than $9.00 per ton as a beef producer. Why can we not feed this hay at a good profit? With the Valley Road building in the near future, the demand for beef will be great while there is practically none available in this County.—Jas. G. Douglass.

WHERE MONEY IS MADE

Finest homes, biggest barns, heaviest crops are found on dairy farms. Dairy farming improves the land. Wheat or similar crops without dairying robs the land. Why not follow the lead of keen business farmers who are making most money? Such men use highly productive land because it pays them profits which inferior land cannot pay, and they use and recommend the highly productive



All There Is to the Light, Simple, Sanitary Dairy Tubular Bowl

SHARPLES Tubular Cream Separator

for similar good reasons. Tubulars have twice the skimming force of others, skim twice as clean, pay profits no other can pay.

The widely known T. Eaton Estate, here shown, near Georgetown, Ont., is but one instance out of many too numerous to mention. Dairy Tubulars are used both on this farm and at Mrs. Eaton's summer home.

No disks in dairy Tubulars. Easy to clean. Wear a lifetime. Guaranteed forever by the oldest separator concern on this continent. One-quarter to twice as much butter as setting milk in pans or cans. Tubulars produce enough more every year over next best separator to pay a big part of the price of the Tubular.

A Lame, Sore, Blemished Horse

Can Be Made Clean and Sound with

ABSORBINE

" The Antiseptic Liniment "

It is the Safest, Surest and Most Economical Liniment I Know Of

ABSORBINE is scientifically and carefully compounded of the best ingredients I can buy. Each ingredient has its particular known work to do, and it is put there for a specific purpose. Careful analysis by the Emerson Laboratory, Analytical and Industrial Chemists, conclusively proves its **antiseptic** and **germicidal** properties, although containing no minerals or poisons.

This means that ABSORBINE applied to an open sore or wound, not only makes it aseptically clean, but **kills the germs** and causes a healthy healing. This is why ABSORBINE is so successful in **Poll Evil, Fistula, Quittor, Wire Cuts,** etc. No danger of infection or proud flesh formations where ABSORBINE is used.

Especially if your horse is a valuable one it is necessary that you use ABSORBINE, as you surely cannot afford to experiment with blisters, "hit-or-miss" or toxic liniments. That is one reason why trainers and breeders of high-grade stock use ABSORBINE exclusively.

The discutient and resolvent properties of ABSORBINE are positive, which accounts for the promptness and certainty with which this liniment permanently removes soft and calloused bunches wherever they may be located.

ABSORBINE is very penetrating and soothing, consequently **stops lameness** promptly and **allays pain.**

Notwithstanding its powerful results ABSORBINE is a mild and pleasant remedy to use, **does not blister, stain or remove the hair,** and horse can be used.

It is economical, as only a few drops full strength are required at an application A bottle of ABSORBINE diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon.

A twenty-year record of results makes ABSORBINE the remedy for you to use in removing **Bog Spavin, Thoroughpin, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings** and Affections; to cure any strain or lameness, to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.

The Emerson Laboratory

177 State Street, *Springfield, Mass.*

MR. W. F. YOUNG SEPT. 14, 1911.

124 Temple Street, City.

Dear Sir,—We recently made an exhaustive test of Absorbine Jr. to determine its efficiency for killing germs. We made numerous tests to determine the dilution, the length of time required to kill disease-producing germs, and we find that your Absorbine Jr. in a dilution of 25 p.c. kills the staphylococcus aureus, the common pus-producing germ, in six minutes; that a 10 p.c. solution kills the bacillus coli, an organism similiar to typhoid bacillus, in three minutes, and that a 10 p.c. solution also kills diptheria germs in four minutes.

Yours truly,

THE EMERSON LABORATORY,

(Signed) Herbert C. Emerson.

You can buy ABSORBINE at regular dealers, price $2.00 per bottle or sent to you, express prepaid, with full instructions. OOK FREE.

The Canadian Farmer—His Past, Present and Future.

(Continued from page 483).

Brunswick to form themselves into a combine to regulate the prices of all farm produce. They should have Provincial and County organizers, and business meetings held in every Parish at least once a month. Hitherto the larger part of the profits have gone into the pockets of the middlemen. We want that rule reversed, and in the future we must have the profit between the producer, and the consumer, even if we have to eliminate the middleman altogether. The production of meats, poultry, eggs, vegetables, fruit, dairy products, grain and hay mean very hard work and heavy expense for the farmer and his profits in this Province are small, in some things he is producing, often at a loss. For instance, the price of potatoes in this market is usually about $1.00 per bbl., this winter, owing to a scarcity the price has gone up to $2.50. The former price is a ruinous one as they cannot be raised for that figure except at a loss. The latter figures mark a new

Mr. Lewis Smith

The new President of the New Brunswick Farmers and Dairymens' Association.

era in the price of potatoes, as they have seldom or never reached that price in this market before, and considering the labor, and cost of production, it is a price that should be maintained. Butter is very scarce in the St. Stephen market at the present time. Storekeepers have not half enough to supply their customers. The reason for this condition is that the price of butter has not advanced with the price of feed for cows. Cows must be well fed to produce butter in the winter. If the price of butter is 25 cents per lb. and the cost of production is 30 cents, it does not need a very brilliant mathematician to forecast the result. With the increased cost of living in every department, there must be arranged for the farmer a new scale of prices, that will enable him to produce the food the world must have, at a profit to himself that will enable him to retain the position of honour and independence, he has worked so hard to win.

Much of the past and present success of the farmer is due to the faithful co-operation of his wife and daughters. Many a man would have become discouraged and have given up in despair if it had not been for the encouragement and sympathy of his wife, as much to her as to the farmer himself is the credit due to the wonderful advancement made in agriculture during the past years, and as an Empire builder she will not be found wanting when this country becomes a great nation.

THE FUTURE.

What has the future in store for us? Just this, we are going to be represented in Parliament. Where there is one farmer there now, there will be ten and from that to twenty, until he is at last predominant in the Legislatures of these Provinces. And will he stop there? Not by any means. There will also be a majority of farmers in the Federal Parliament at Ottawa. How are we to accomplish all this? I will tell you in confidence and in all earnestness, that this result can be brought about within a very short time, and in only one way. Listen! Organize all over this great country of ours, unite as one man. Form a new party called, The People's Party, and put in the field only farmers as candidates for election in rural constituences, vote for them to a man, and any time after that when the Federal Parliament meets there will be the most notable assemblage of farmers ever seen on Parliament Hill or elsewhere. The Premier a farmer, at least one-half of the Cabinet Ministers farmers, and a majority of the House the same. When this is accomplished, prosperity will reign from ocean to ocean in which all classes will participate as it will be a government of, and for the people. We will have the highways widened, levelled up, and graded, over which motor cars and horse vehicles may go to and fro with all ease. The whole face of nature will be changed by the roads as level and hard as a race track. There will be beautiful farms, and buildings of modern construction, magnificent flocks and herds of pure-bred stock, and poultry. All modern conveniences will be in the farmers' home. The telephone lines will be owned by the government, or prices controlled by a government commission. Money will be more plentiful and interest correspondingly low. Modern farm machinery will be less cumbersome and more effective. Electric power will be used where available. The water powers that are now running to waste will be harnessed and used to furnish electric power to run the machinery of whole communities miles away and also to furnish all farm buildings with electric lights. The farmer of the future is destined to be the man of the century. He will be sought after in civil, political, and social life, and he will be regarded as what he really is, and what all the past years of toil have led up to. The builder of this great Empire, Canada.

SHERWIN-WILLIAMS PAINTS & VARNISHES

12 nozzles that will not clog, sprayin both tops and vines with 125 pound pressure, et after the parasites. Fullcontrol fromdriver's seat. Has automatic regulator and agitator nozzle protector, pressure relief, 12 gal. air-pressure tank, draining, air and controlling cocks. Equally efficient on row crops or orchards. Made for 1 or 2 horses or hand. Awarded gold medals at National Horticultural Con ress. Write for free treatise on crop diseases. AGENTS WANTED.

W. C. HEARD, 1379 King St., LONDON, CANADA.

Niagara Lime-Sulphur Swift's Arsenate of Lead

KNOCKS SPOTS OFF ANYTHING!!!

First spraying just before the buds burst use 4 gals. NIAGARA LIME-SULPHUR to 40 gals. spray barrel. This will rid trees of Oyster Shell bark louse, aphis eggs and other objectionable pests, if put on in April. Clean trees mean sound fruit.

Spraying at the proper time will perhaps mean hundreds of dollars profit when you come to sell your fruit.

Spraying is an Insurance, differing from an Insurance Policy onpersonal property, inasmuch that on buildings a loss has to happen before the insurer recovers. Spraying with NIAGARA LIME-SULPHUR and SWIFT'S ARSENATE OF LEAD protects your fruit crop against destruction from the dreaded Black Spot and ravages of insects.

Place your order at once, our factory is now running. A one cent postal card will give you our Spray Calender telling how to use our Spray to the best advantage.

Niagara Spray Co. of Nova Scotia Limited,

KENTVILLE, Nova Scotia.

Victoria County Seed Fair.

Victoria County has again shown her progression by organizing a Seed Grower's Asociation, and on April 4th the first fair was held in Dionne's Sample Rooms, Perth, and was a decided success. There were over one hundred exhibits, a large number considering the short time the farmers had to prepare for it, as the Association was only organized Feb. 24th 1912.

S. J. Moore, Maritime Seed Inspector, was the judge and pronounced the samples of seed esxcellent in quality, especially Wheat, Oats and Beans. The exhibit of potatoes was large both in quantity and quality, most of the exhibitors putting size ahead of quality. This was due to inexperience, as scarcely any of the farmers around here had ever seen a seed fair before, and did not realize that it was potatoes fit for seed that was wanted. We hope to profit by the experience gained in this our first lesson on seed selection.

The following are the prize winners:—

Wheat, Red Fife, 1, Amos Smith; 2, David Curry; 3. Donald Innes; 4, J. W. Stevenson.

Wheat, White Fife, 1, Robert Porter; 2, Donald Innes; 3, David Curry; 4, Leo Miller.

Wheat, White Russian, 1, C. E. Pickett; 2, David Curry; 3, Alex Philip; 4, John Turner.

Potatoes, Red, Any Variety, 1, Donald Innes; 2, Amos Smith; 3, Carl O. Hansen; 4, David Curry.

F. E. Henderson Sec. Treas.

Preventive Steps Regarding the Brown-Tail.

George F. O' Halloran, deputy minister of agriculture, has issued a circular giving notice of the regulations prepared in view of the alarming increase of the brown tail moth, which provide rigid penalties in case of failure to report and to take preventive measures.

The regulation under "The Destructive Insect and Pest Act" follows: "Any inspector entering any land nursery or other premises where there is reason to believe that any of the insects, pests or diseases hereinafter specified, and such instructions shall give instructions for the treatment or destruction of any tree, bush, crop or other vegetation or vegetable matter or the containers thereof, which may be found or suspected to be infested with any of the insects, pests or diseases hereinafter specified, and such instructions shall be carried out by the owner or lessee of the infected or suspected vegetation, vegetable matter or containers thereof, and such remedial treatment shall be carried out and continued untill the insect, pest or disease shall be deemed by the inspector to be exterminated."

Under this regulation it will be necessary for all owners of trees upon which nests of the brown tail moth occur, to remove such nests and burn them and, in the case of heavily infested trees and vegetation, to spray such trees or vegetation in strict accordance with the instructions given by the departments inspector's.

With regard to penalty, section 8 of the act says:

"Every person who contravenes any provision of this act, or any made thereunder, shall be liable, upon summary conviction, to a fine not exceeding $100 or to imprisonment for a term not exceeding six months, or to both fine and imprisonment."

Grow Your Own Dairy Feed.

Editor Maritime Farmer;

We are trying to be progressive in our farming methods and have purchased a grinder from Beaver Bros. Co. Springfield, Ohio which grinds the sheaf as it comes from the binder. We mix this ground grain and straw with ensilage and pulped turnips with a few pounds of cotton seed meal to balance. We feed this mixture twice a day and we find that it gives us good returns. Our aim is to grow all our own grain, oats, barley and peas, mixed in the ratio of one bushel oats, one peck barley and one gallon peas which we let ripen and instead of threshing we grind and feed as described. We call this the poor man's feed. Instead of trying to raise hay, spread all the manure you can spare on the oat field and you will get A. 1 crops that with my system, will make fine rations for your dairy cows and you will not have to buy so much heavy feed.

I trust the Maritime Farmer will continue to prosper in its good work. —J. D. Fraser, Pictou, N. S.

KING COLE TEA
More zest in your tea-cup!
More smack in its delicious enjoyment!
At last, expensive study of flavor-blending has perfected a fullness a richness, a smoothness of flavor that was once thought impossible.
Why it was thought impossible one sip of a cup of King Cole Tea will tell you it is so much nicer so far more satisfying in the grateful fullness of its flavor than any tea you ever tasted.
King Cole Tea is flavor-fuller.
YOU'LL LIKE THE FLAVOR.

FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S GALL CURE,** a soothing, healing salve, the old time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. Bickmore's Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel, etc.** You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trademark on every box. None genuine without it. Look for it when you go to buy and do not take a substitute. Farm account book is ready. No obligation. Send today.

FLORICULTURE.

H. A. S., writes:—Will you kindly give me information, through the Maritime Farmer of next month re what sort of soil and light is necessary for successful culture of Pansies and Mignonette. Please tell me also what care a Rubber Plant needs. Every year, so far, our Pansies have died off in August. The stems of the flowers were very short and they soon died. Do they need much sun or do they grow better in the shade? Does the Lily of the Valley require sunshine? What is the best fertilizer to use on Rose bushes?

Pansies require a light soil and a partially shaded location. They should not, however, be placed directly under large trees where they would be liable to receive the drip from damp foliage; this especially applies to the coast, where the fog makes the conditions such that little besides grass will grow under dense trees. Beds on the north side of buildings or fences are preferable and the soil should be enriched each season with rotted manure. Mignonettes, on the other hand, require plenty of sunlight and should never be planted in a very shady place. The Lily of the Valley likes shade and moisture and will do well under trees if well fertilized. Well rotted or composted manure is best for all kinds of plants including Roses. When this is not available, use liquid cow manure, applying once a week.

Do not use chemical manure, such as superphosphate on Roses or tender garden plants.

The difficulty with correspondant's Pansies is probably poor and dry soil and neglect in removing the seed pods from plants; as soon as a bloom fades it should be cut off. Pansies mature quickly and if allowed to seed freely, they lose their vitality by August, and succumb to dry conditions, much sooner than the harder wooded plants. Planting quite thickly in the bed also prolongs the season of growth, if the soil is fertile.

The Rubber Plant requires a light, rich soil, with good drainage, plenty of light but no sunshine, frequent washing of foliage both upper and under sides of leaves and a fairly even temperature. The soil should be kept moist; but not soaked with water and great care taken that no water ever stands in the jardineire or saucer, about the bottom of the pot.

Repot Palms, Rubber Plants and Ferns that are pot-bound at once, using plenty of charcoal, broken pots, etc., in the bottom of the pot to assist in good drainage, and packing the new soil firmly about the old ball of roots with a stick.

Cut back old Geraniums, Fuchsias, etc., so that they will not be straggly. Geraniums, especially, will stand a severe pruning.

Plant Verbenas, Asters and Lobelia seed in small flat boxes or saucers for early plants.

It is not necessary to put glass over seed boxes at this season or the year, but if used, it should be removed as soon as the first plants appear.

Transplant Annuals from the seed boxes into shallow or small pots as soon as the character leaves are fully developed.

Big Ben

**To sleep late's pleasant, now and then,
Make it Sunday morn—says Big Ben**

Big Ben is an alarm clock that's on the job every minute of the day. He *rings* on time, he *runs* on time, he *stays* on time.

He *weighs* three times as much as the average alarm clock, he *rings* three times as loud, he *lasts* three times as long.

He has a great big dial you can easily read in the *dim morning light*—a cheerful, deep toned voice that will wake you on your *sleepiest mornings* — large, strong winding keys that are a *pleasure to wind*—selective alarm calls that ring *just when you want* and either way you want, steadily for *five* minutes or intermittently for *ten*.

He's punctual, lasting, handsome and the best *insurance* against oversleep that's ever been heard of. His work doesn't end with the morning call, he's a good reliable time keeper for *all day* use and he's good looking enough for any surroundings.

5,000 Canadian dealers have already adopted him. His price is $3.00 anywhere — A community of clockmakers stands back of him. *Westclox, La Salle, Illinois* — If you cannot find him at your dealer's, a money order sent to them will bring him to you duty charges prepaid.

FREE—MAGNIFICENT PHONOGRAPH—FREE

Here is the most stupendous offer ever made by any reliable firm. We will give away absolutely without one cent of cost, 1,000 of these magnificent Phonographs, or Talking Machines, complete with your choice out of hundreds of the newest and most popular records.

This is the chance of a lifetime **An absolutely honest offer**

These grand phonographs are not toys, but genuine talking machines, manufactured and guaranteed by one of the largest European makers of high grade Phonographs. It talks, sings, plays orchestra, instrumental, or band music, tells funny stories, and, in fact, **can do everything you would expect of a $50 machine.** It uses a regular cylinder record, of which we send you a large list to choose from. It winds up and is run by a regular clockwork motor, has a special governor to regulate and control speed, nickel plated sound producer fitted with perpetual needle. It is so entirely simple and easy to operate that any child can play it. It is full size, newest Lyra shape, beautifully enamelled and finished throughout, and fitted with a bright metal horn. You can put music, entertainment, and constant pleasure for everybody into your home, and you don't need to throw away your money by paying $40.00 to $50.00 for a talking machine, because you can get this one absolutely **FREE** for only a few minutes easy work.

Now all we ask you to do is to just send us your name and address, and let us send you, postage paid, and without one cent in advance, only 6 boxes of the famous Dr. Edson's Life Building Blood Tonic and Nerve Pills to distribute among your friends at our special introduction offer of only 25c. a box. They are the greatest remedy on earth for weak and impure conditions of the blood, nervousness, dyspepsia, stomach and kidney trouble, and a great Tonic and Life Builder. With them we will send you, also a sample of Dr. Edson's Harmless Headache Tablets and 3 boxes of Edson's Little Wonder Stomach and Liver Pills, making a total of only 14 boxes in all, and you will sell them all in a few minutes because every purchaser of a trial box of these famous remedies can receive free from us, a grand present of fine silverware or gold finished cuff links or ring. When you have sold the 14 boxes, return us the money, only $3.50, and this grand phonograph and one record of your choice, together with an opportunity to get dozens of new records free, will be forwarded to you at once.

REMEMBER. We are bound to secure a national distribution for these grand remedies, no matter how much it costs us, and when we say we will give you this grand phonograph complete for selling only 14 boxes at 25c., we will do so. Do not miss this wonderful opportunity, but write to-day to

Rural Vs. Urban Life.

Editor Maritime Farmer:—

In these days when we hear so much of the "back to the land" movement, very naturally we are interested in both sides of the question, and the reasons back of the agitation Not only are people of the present day taking a greater interest in the life out of doors, and developing a fondness for a simple and more rational mode of living than is found in the average city but what is more important, they are beginning to look at the question from a business standpoint, and are coming to realize that an agricultural pursuit offers just as good opportunity for a living, and even for the making of money, as any other branch of business. In our complex system of civilization, life becomes one great struggle for existence—and the survival of the fittest. The competitive spirit enters too much into everything. We strive for things we do not always want, merly because others have them. We do not when to stop and be satisfied. A man is not necessarily lacking in ambition because he ceases to strive for that which would give him no pleasure to possess, nor any joy in the getting. The most desirable thing in life is happiness, and happiness means contentment. How many men in our cities today are really contented with their lot ? The rich may be, but the average man working for a salary (like ourselves)is usually unsatisfied, simply because he has not certain things possessed by his more fortunate neighbors. The majority of us live beyond our means : we may not think we do, but it is true nevertheless,for any man, depending solely upon his salary, who does not put by a little each year for the proverbial "rainy day," is in reality going behind.

We worry too much (most of us because we have to) The ever increasing cost of living worries us : our poor health, caused by indoor life, high living and late hours, worries. Our life is too strenuous.

What about the farmer?. Take those of the poorer class who do not make money, they still make a good comfortable living—how many city men make any more than that . Take the average farmer : he owns a comfortable home, has the best of food—and lots of it, works hard with little real worry, lives a natural, healthy, outdoor life, is his own boss and can take a day off when he feels like it (can we do so, even if our own boss, can we afford to neglect our business for a day's pleasure)? He may not handle much actual cash but he has the things which you and I have to buy with our money, and he gets them cheaper and better.

Farming today is not the narrow, primitive, pioneer existence it was a hundred years ago ; the farmer has progressed, just as we have. The prosperous ones enjoy all the comforts and conveniences of modern times, they live in good houses, furnace heated, fitted with water and bath ; most of them have telephones, and some automobiles, and they send their children to college. The successful farmer of today knows that there is just as much room for brains as brawn, in his business, and he can use his own brains to employ men with more of the latter, and show a good profit from the transaction.

Did you ever stop to compare the artificial, hurry-and-worry life of the city man, cooped up in a steam-heated office eight or ten hours each day, and two weeks' holiday a year; with the life of a farmer, who gets up in

YOUR CROPS

can get more nitrogen out of one single sack of

Nitrate of Soda

than out of a two-horse wagon load of manure. The Nitrogen in Chilean Nitrate of Soda is 100% available and is *immediately* so the day you apply it! It produces

More powerful growth and healthier, bigger plants. Easy to handle, clean, cheap, odorless, free from fillers.

Write to us for valuable free literature on the crops that mean a living to you. A post card will bring it to you.

The GREATEST Offer Ever Made

HOW TO GET ALL FIVE PRESENTS, FREE

JUST send us your name and address and you will receive by return of mail only twelve (12) lovely red and gold boxes of Dr. Edson's Famous New Skin Carbolic Salve, which we want you to introduce for us, at only twenty-five cents per box. It is the greatest ointment in the world for burns, cuts, scalds, bruises and all skin diseases, and you will sell it very quickly because with every box we will send you a lovely gold finished engraved Brooch, to give **FREE** to every purchaser. You are sure to sell them all in a few minutes. Return our money, only $3.00 when sold and we will promptly ship you **All Five Magnificent Presents (the whole ten pieces)** exactly as represented. We arrange to stand payment of all delivery charges.

LIST OF PRESENTS

1. **Big Paris Beauty Doll, nearly 16 inches tall** beautifully dressed with picture hat fancy dress, shoes, stockings, lace-trimmed underwear, etc., real sleeping eyes, curly hair and jointed arms, legs and head, truly a grand doll.
2. **Magnificent Real Brown Imported German Reed Doll Carriage,** big and handsome with real enamelled steel wheels and axles, bent wood handles and big enough for a whole doll family.
3. **Lovely Silk Finished Parasol for the Doll Carriage,** can open and shut like a real baby parasol. It will protect dolly from the sun or rain and gives a very handsome appearance to the lovely doll carriage.
4. **This Great Little Five Piece Fairy Kitchen Set,** the loveliest little pastry and baking set you have ever seen.
5. **Handsome Gold-Laid Jewelled Ring** set with a sparkling imitation gem.

We are spending thousands of dollars to introduce this famous product. You take no risk--if you cannot sell the goods you simply return them to us.

NATIONAL SALES CO., LTD.
Dept. D 263 Toronto, Ont.

"WILLOW FARM" FOR SALE.

"Willow Farm" is situated two miles from the centre of the town of Amherst, which is a growing manufacturing town of over nine thousand population, and one of the best markets in Canada. There is a good public school within forty rods of the house.

The farm consists of one hundred and twenty three acres, forty three acres of marsh and eighty of upland, sixty five of which are under circulation.

The upland is in a high state of cultivation as a large stock of cattle have always been kept on the place and for several years a short rotation has been followed. The soil varies some but is mostly a good loam quite free from stone and easily worked. The pastures are well watered by springs and brooks.

The house is 28x38 feet, two stories with ell 16x20 with good cellar, heated by furnace. Barn 50x80 feet with basement stable which will accomodate forty cattle and six horses, also root cellar holding two thousand bushels. Carriage and impliment shed 26x36 feet and other out buildings all in first-class repair.

The fencing is nearly all of woven wire and in good order,

A wood lot of 70 acres, three miles from the farm will be included in the sale.

A retail milk trade of about one hnndred and twenty quarts a day will be sold with the farm if desired.

This is one of the finest live stock and dairy farms in Cumberland County ; a beautiful home and a splendid opportunity for the right man. Apply to

TRENCH'S REMEDIES, LIMITED
107 St. James' Chambers, Toronto.

"My little son had a very severe cold. I was recommended to try Chamberlain's Cough Remedy, and before a small bottle was finished he was as well as ever," writes Mrs. H. Silks, 29 Dowling Street, Sydney, Australia. This remedy is for sale by all Dealers.

the morning feeling strong and vigorous, eats a square meal while we are yet asleep, works all day for himself in the open air surrounded by all that is beautiful and fresh and bright in Nature, who quits work tired but in good spirits, and who goes to rest "weary and content and undishonored." Except for a two weeks' vacation, the average city man sees very little of the country and the woods and God's lovely out-of-doors. On hot summer nights he sits by an open window looking into someone's back yard, trying to get a little rest and enjoyment, although often times the heat is then most unendurable, and the clang of tramcar gongs and other street noises make enjoyment a mockery.

The farmer sits on his verandah, drinking in the cool night breeze, which comes to him laden with the perfume of wild flowers, and as his gaze wanders across the green fields to the distant sunset, he is filled with a sense of peace and quiet and contentment that we in the cities know not of. City workers are beginning to think of these things to-day more than ever in the past, and in a very few years we shall see our rural districts growing in population instead of decreasing.

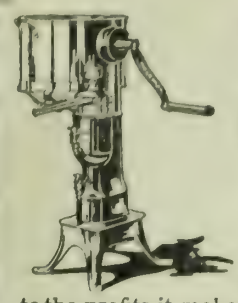
Our Agricultural Colleges are doing a splendid work in promoting an interest in farming; and provide, practically free of charge, courses in every branch of agriculture, both scientific and practical, so that not only those engaged in these pursuits may acquire additional knowledge along their own particular line, but anyone who desires to take up agriculture, may, with the courses provided and practical experience gained during the summer, qualify himself to enter upon a business which is not only profitable, but offers an ideal life.—"City," Halifax, N. S.

Potato Canker.

The scarcity of potatoes in Canada this year and the consequent importation of tubers may have a serious effect on the health of the consumers and also on the future of potato growing in Canada. The trouble is the disease which exists in potatoes from Gregt Britain, Ireland and other European countries.

A bulletin issued by H. T. Gussow, Dominion botanist, at the experimental farm, explains how potato canker has found its way across the Atlantic into Newfoundland with potatoes imported from Europe. Potato canker, he pointed out, is a disease at present unknown in Canada. It is one of the most serious diseases affecting not only the farm lands on which potatoes are grown, but the disease is also decidedly injurious to the health of the consumer of affected potatoes. Boiling does not destroy the injurious properties.

The disease is characterized by nodular excresences which may often be larger than the tuber itself. These cankers affect the eyes of the potatoes and are very small in the early stages. Any tubers found with smaller or larger outgrowth rising from where the eyes are situated should under no consideration be used for seed or table purposes. Farmers and consumers should be exceedingly careful in using potatoes that may have been imported from Great Britain or the continent of Europe. Suspicious looking tubers should be destroyed by fire and not be thrown on the ground or the disease, if present, will establish itself permanently in the soil.



The Right Price To Pay For a Cream Separator

WHAT is the right price to pay for a cream separator? The price of the best, of course. The first cost of the best separator is so small, compared to the profits it makes—that you ought not to hesitate about paying for it. And the difference between an I H C and the next best is so marked, that you ought not to hesitate in deciding.

I H C Cream Separators Dairymaid and Bluebell

have made records on thousands of farms. They are famous everywhere for durability, close skimming, light running and easy-to-clean advantages. They are built for hard, twice-a-day service and many years of it. They have milk and dust-proof gears which are easily accessible; a patented dirt-arrester which removes the finest particles of dirt before the milk is separated; frame and moving parts protected from wear by phosphor bronze bushings; large shafts, bushings and bearings; also many other features which you will be interested to know about.

Call on the I H C Dealer

I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes. The I H C local agent will give you catalogue and tell you all the facts, or, write the nearest branch house for catalogues and any special information you desire.

Indigestion in Farm Animals.

Editor Maritime Farmer:—

I consider that fully 75 per cent. of all sickness in farm animals is caused by digestive trouble, most of which are easily preventible. In this article, I will endeavour to give a few suggestions by the way of prevention, which is so much better than cure. We are all aware that running naturally on pasture, farm animals rarely suffer from sickness of any kind; stable them and they are liable to all manner of diseases.

With horned cattle, indigestion, impaction and other forms of "stomach trouble," are always caused by faulty feeding, usually by sudden and violent changes in feed. As I am not a veterinary authority, I will not attempt to explain the action of different foods on the digestive tract, but the "observing" cattleman will see indications of this trouble early enough to prevent any serious illness.

Acute indigestion will often kill an animal quite suddenly unless relieved, and many cattle are found dead at the barn in the morning that were apparently all right the night before. The formation of gas in the first stomach has been so rapid and the pressure on the lungs so great that the animal has been simply shocked to death.

I know there are cases of this kind that seem to be hard luck, but an observing man, one who has trained himself to notice the condition of the animals under his charge, every time he passes them, (without even thinking of it), will usually notice some signs of trouble in time to remedy it. Everybody handling stock should be able to distinguish the grunt of contentment of a well filled stomach from the grunt of pain in an overloaded one, even at a distance from the cows, and it is this intelligent observing characteristic in some men that make them such successful stockmen.

Every farmer or owner of cattle should keep a supply of simple remedies "always on hand," such as Epsom salts, ginger, soda, etc., and as quickly as possible after any symptoms of indigestion are observed give (a fairly large cow, on a full stomach) 2 to 3 lbs. salts, five table-spoonfulls each ginger and soda, with plenty warm water, (I have often given a gallon). Then blanket warmly. Do everything with the idea of getting the stomach warmed up.

All veterinary works, that I ever saw or Veterinary Doctor, either, give entirely too small a dose of medicine for impaction in cattle, "We will give her this much first, and see in the morning," is no good; in the morning she is often dead, or a harder proposition to treat. Anyone who has ever seen the first stomach of a large cow opened out, will know what chance one lb. salts and a quart of water, would have in starting that load.

I have repeatedly seen cows given this treatment, and warm applications, chewing the cud in three hours. "After treatment" is important, and we must feed lightly on soft mashes for a few days, warming the water, and watch the cow carefully for some time. It is better to feed some conditioner for a few weeks to strengthen the walls of the stomach, before bringing her on to full feed.

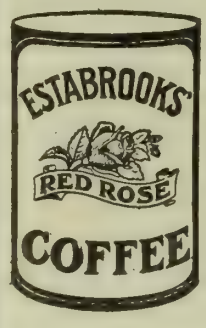
Where animals are properly fed on good, "well cured" feed, including turnips, trouble of this kind is seldom met, but if we would have "good luck" with stock , be on the lookout and act promptly and give medicine according to the size of the animal, and the weight of the load you wish to start, and in the case of a strong animal don't be afraid to give plenty at first.

Infaction of the mamyplies or third part of the stomach is not such a common ailment, and is usually found in cattle out of condition that have had a violent change of feed, or an over dose of some dry indigestible food. Give the same treatment, and if a passage of the bowels does not result, give 50 drops croton oil in linseed. I remember a case when I was a boy, that impressed me with the fact that a cow's stomach, can not only handle rough food, but can also, often stand very rough usage. One of our cows came home in the evening badly bloated and almost as soon as we noticed her, staggered and fell. Being alone at the time, and having seen cows tapped before, I drove my Jacknife into her stomach without seeming to let off much gas. Seeing the cow was going to suffocate, if not given relief, I secured a butcher-knife and made an opening large enough to put my hand in between the hip and first rib. This let the wind out of her in a hurry. I then gave salts, but did nothing to the wound. Next morning the medicine had operated, the cow was resting easily, with the air entering and leaving her stomach with every breath, and this cow lived, to rear calves again, although it was nearly three months before the opening closed up. This taught me that with a cow, where there is life, there is lots of hope.

Young calves are much more subject to indigestion than older cattle, and when being raised and fed from the pail, require very careful feeding. Our plan is, to feed the calf its mother's milk until it has fleshed up strong enough to be considered a fair veal, whether this takes one or four weeks. It is useless to change the calf from whole to skim milk unless it has started to put on flesh and every man must use his own judgment in this respect, as no general rule will apply to all calves; only I would

Perfect Coffee
Every Time

Unlike common coffees, RED ROSE has the same rare flavor when it reaches your table as it had when it left the roaster. For it is sold only in air-tight tins, hence none of its strength or flavor is lost.



Crushed (not ground) So Brews Clear

Our new process crushes this coffee into grains of uniform size and takes away the chaff which makes most coffees bitter. Thus Red Rose Coffee is as easily made as Red Rose Tea, and pours clear without any "settling." For a "full-bodied," bright, brisk coffee we commend

THE Keeley Cure

First in 1880 Foremost Ever Since

DRUNKENNESS

Is a Disease---And We Can Cure It

Most men who drink to excess do so because they cannot help it; they are controlled by a craving which is practically irresistable. This is a diseased condition but can be, and is, promptly relieved.

How ? By taking the **Keeley Treatment** at a **Keeley Institute,** the only place to get it and the only treatment which cures alcoholic and drug inebriety.

The **"Keeley Cure"** removes the craving for liquor and drugs and leaves the man master of himself. The system is rational, it embodies no suffering or sickness, no absured or preposterous claims are made; the hypodermic method of treatment is constantly used, which, according to all reputable physicians, is safe, painless, prompt and efficient.

The "**Keeley Cure**" does not nauseate a patient and no attempt is made to cure inebriates by creating a disgust for liquor. A treatment depending on nauseants or emetics for a cure can never be anything but a failure because the patient will soon learn that it is not the liquor which nauseates him but that he has been made the victim of a trick : the diseased condition not being relieved the patient naturally goes back to liquor.

The diseased conditions produced by from five to thirty years constant or periodical use of liquor cannot be cured by a few days of nausea and emesis. Such methods are irrational, brutal, and sometimes permanently injurious.

The "**Keeley Cure**" has restored over 400,000 men and women who were addicted to liquor and drugs; it is the pioneer in this work and has many imitators, but no rival or competitors as far as results are concerned.

If you have need to take treatment for the Liquor or Drug addiction, investigate **The Keeley Cure**, a treatment that is known the world around, and which is recognised by the public and the medical profession as the only successful treatment for these addictions. Look up some of our former patients, whom you will find in every community, They are healthy, happy and prosperous; many of them will tell you that they would not be living today if it had not been for the **Keeley Treatment.**

We have special accomodation for ladies, where they can be entirely exclusive, and can be treated as privately as in their homes.

Printed matter and particulars by mail in sealed plain envelope.

All letters promptly answered and treated as strictly confidential.

The Keeley Institute

T. B. MORRISSEY. Manager.

151 Congress St., Portland, Me. Munjoy Hill

The Nearest Institute to the Maritime Provinces.

rather, with ordinary strong calves, to start adding some skim milk at 10 days and continue for five or six weeks feeding half and half, than to feed new milk for three weeks than to break off too suddenly.

It is most important also, to teach the calf to eat some dry meal, as early as possible. We can then feed a smaller quantity of skim milk, thus lessening the chances of the calf scouring. The meal strengthens them and brings them along faster.

With large breeds the young calves are often not fed nearly enough dry feed. Growth is very rapid and we must continually increase, as it is surprising the amount of pulped turnips and hay three months old calves will consume. We very seldom find it necessary to give the calves any medicine for indigestion; the feeder always takes careful notice to see if any are getting off their feed or starting to scour, in which case, simply give smaller amounts of skim milk for a feed or two is all they require. Success with calves as well as all other kinds of farm animals is only obtained by eternal vigilance.—Walter M. Lea, P. E. I.

How I Conquered Fruit Pit.

Editor Maritime Farmer:—

While reading, in your issue of January 30th, a description of Fruit Pit or Baldwin Spot, it called to my memory an experiment I tried to cure what I thought was apple scab or black spot that proved successful. I thought probably it might work the same for Fruit Pit or Baldwin Spot. Or that I may have mistaken it for apple scab.

I had a tree about 60 years old, an excellent seedling and a good bearer, that had been standing in sod for 15 or 20 years. It was usually manured on alternate years with barn-yard manure and it developed what I thought was apple scab so bad that the fruit was virtually useless. So, after reading all the arguments in favour of spraying as a remedy and noticing the opinion or experience of a western scientist, who stated that spraying was more effectual the 2nd year than the first. I concluded that to try for a permanent cure by spraying was like using liniment for rheumatism and that as rheumatism was caused by an over charge of acid in the blood, apple scab was caused by the exhaustion of some certain element in the soil, and as spraying proved more beneficial the 2nd year than the first it must be the beneficial results of the ingredients of the spray washing to the soil. So I procured 5 lbs. of Blue Vitroil, 1 lb. of sulphur and in early spring I scattered one-half of each quantity around the tree, just as the frost was coming out of the ground, covering a space as far as the limbs extended which was probably 15 feet on each side of the tree. I waited until blossom buds were beginning to show a little red then I spread the balance and while the tree was wet with dew I threw dry hard wood ashes all over the foliage and limbs, which I repeated again after the fruit was well formed and waited result. To my great joy there was not a spot to be found on a single apple nor has there been ever since, as I have now picked 5 crops of perfectly clean apples.

Now, sir, if this stirs the curiosity of some, so-called, scientist or fruit grower to try it and it proves as beneficial as it did with me I will feel well repayed for writing.—J. T. Hetherington, Queens Co., N. B.

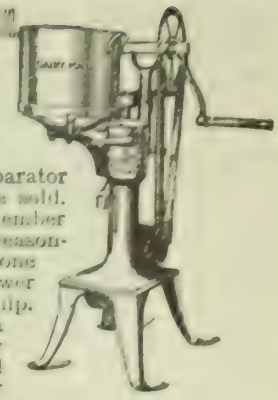
The Best Cream Separator is the Cheapest in the End



THE cost of manufacturing a cream separator determines the price at which it may be sold. Therefore, when selecting a separator, remember that the machines which are offered at an unreasonably low price can be offered at that price for one reason only—they are built to sell at prices lower than the cost of good material or workmanship.

Such separators are costly at any price. Only a good separator is cheap; not because of a low first cost, but because it will last for years and save enough butterfat from the milk of four or five cows every year to pay for itself. The best workmanship and material that money can buy are used in making

I H C Cream Harvesters Dairymaid and Bluebell

You will find an I H C the cheapest separator you can buy, because it will do better work and last longer than any other separator.

Go to the nearest I H C dealer who handles these separators and see how carefully they are made. You will find that they have phosphor bronze bushings—that the gears are spiral cut—are entirely protected from grit and milk, and at the same time are easily accessible.

The neck bearing is trouble-proof. The patented dirt-arrester chamber removes impurities before separation begins. These separators are made in four sizes. Ask the I H C local agent to show you one, and give you a catalogue, or, write the nearest branch house for catalogue and any other information desired.

Do it Now.

When a man aint got a spray pump
and is feeling kinder down,
And the pesky little insects won't
leave his crops alone,
It's a great thing, oh my brethren,
for a feller just to say
"Send and get a 'Perfect' spray
pump, and apply a coat of spray."

It makes a man feel queerish when
the season's work is through,
And the tatties are all blighted and
the apples wormy too.
Then order up a "Perfect" and do it
right away,
And spray the fruit and tatties and
save them while you may.

You'll never find another that does
the work so well,
From strainer up to handle, the
outfit works just swell,
It has good agitation, and a real re-
lief valve too,
It throws a spray that's "Perfect"
and what more could it do?

Ocean Limited Early on Route.

SUMMER TIME CHANGE ON INTERCOLONIAL RAILWAY JUNE 2.

The summer change of time on the Intercolonial Railway will go into effect on June 2nd, when the famous Ocean Limited will be p,aced on the route between Montreal, St. John, N. B. and Halifax, N. S. with connections for and from the Sydneys and Prince Edward Island in anticipation of an early rush of summer travel. The time schedule is expected to be practically the same as last year, which means that the "Limited" will leave Montreal at 7.30 p.m. reaching Levis at midnight, and giving through passengers the opportunity of seeing the famed Matapedia Valley during the earlier hours of the morning and a view of the Restigouche River and the blue waters of the Baie des Chaleurs. The beautiful valley of Wentworth, N. S. will be seen in the more mellowing light of early eventide, and the train will reach Truro at 8.00 o'clock connecting with the through night express for the Sydneys and arriving at Halifax at 10.00 p.m.

The Maritime Express under the summer schedule will leave Montreal at 8.15 a.m. and through passengers will have the daylight journey through Quebec, and a view of the majestic St. Lawrence as it widens in its course to the sea. Making connection at Moncton with morning express for St. John the Maritime continuing eastward will reach Halifax at 13.30.

The Ocean Limited will leave Halifax westbound at 8.00 a.m. and the Maritime Express will leave as usual at 15.10 thus there will be a through week day service by two trains equal to the best on the continent.

The Third Annual Maritime Horse Show

(Continued from page 471).

herst Hotel for the best Grade Heavy Draught Four-in-Hand was won by R. P. P. Fraser's well matched quartette.

GENERAL PURPOSE HORSES.

were out in strong numbers. In the class for singles no fewer than fifteen horses appeared before the judge. Spurgeon Gammon's horse Splinder carried off the palm with Stuart Etter's Tom a close second and I. I. Peel's Billy and J. Russel Embree's Frank in third and fourth places.

Six teams appeared in the double section of the General Purpose class. J. Russel Embree had the first prize winner, C. W. Fawcett captured the second prize and R. P. P. Fraser took away the third.

AGRICULTURAL.

Clydesdale breeding predominated in the Grade Heavy Draught classes. It was here that the true value of the Heavy Draught Pure-Bred sire was more in evidence than in any other class.

The aged mare or gelding class was led by Fowler Bros.' Minnie and Major by Prince of Annick, Gammon & Wier captured the third and fourth prizes and further down the list were seven other good horses that would make a creditable show at any fair.

W. P. Keilor's King, Forrest Bros.' Prince, and Doll and E. W. Embree's Bess in a class of five entries captured the prizes in their respective order in the four-year-old Agricultural class.

The three-year-old class had nine entries. T. W. Keilor's Sue and C. M. Shipley's Topsy both by McFarlane Bros.' Vanderbilt stood in for first and second monies. E. H. Forrest's Rex, a Percheron bred colt captured the third prize while Maud, a filly Vanderbilt, owned by E. W. Embree was successful in securing the fourth prize.

There were four two-year-olds in the Agricultural class. Ronald Rutherford's Sandy headed the list and J. O. Trueman's Harry and Rose took the remaining two prizes.

Geo. M. Holmes' Rose and Nellie Gray owned by Elbert Black had no competition in the yearling class and were awarded prizes as they stand.

The matched teams of this class numbered ten. Fowler Bros., R. P. P. Fraser and C. W. Fawcett were the prize winners.

Fowler Bros.' Minnie captured the diploma for best Agricultural animal, any age.

PONIES.

J. T. Chapman, Amherst, N. S. had the only pony at the show.

HAULING COMPETITION.

In the hauling competition for single horses there were only two entries. An Amherst Foundry horse moved the heaviest load. I. Allen's horse was the next best.

Three teams appeared in the section for doubles and were awarded prizes as follows:— 1, W. F. Beatty; 2, Stuart Etter; 3, Albert Lowther.

The 1912 Show is over. It was a great improvement over the shows of preceding years. Its influences will be far reaching and more interest will be taken in the breeding of good horses throughout the Maritime Provinces. To our farmers, in general we would say, carefully guard against breeding to unsound sires; follow an ideal type in breeding and ere many years have elapsed you will have teams of which you and your boys will feel justly proud. You will find that there is money in breeding the right kind of horses.

The Currie Horse Collar

We make all sizes, shapes and styles to order and can make a collar to fit any horse. You no doubt have trouble by your horse being galled; why not use a collar that has always given satisfaction? Our collar has been a leader for twenty years and has proved to be the most practical collar ever put on the market. Sold by most reliable dealers in Eastern Canada.

Ask your harness man for it. If he does not handle it send to

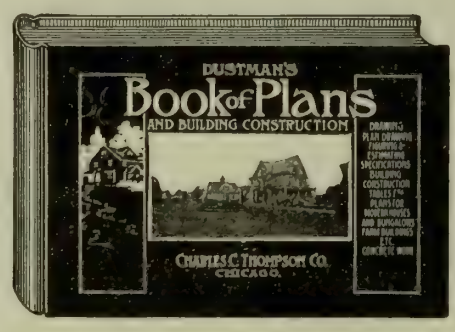
Dustman's Book of Plans



—AND—

BUILDING CONSTRUCTION

By U. M. DUSTMAN
(Licensed Architect.)

10,000 Sold in 30 days

Price, $2.00 Prepaid.

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an anthority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs Writing of Specifications.

This book will be sent, together with a year's subscription to The Maritime Farmer, to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscripton. If you are not already a subscriber and want the book, you may obtain it and The Maritime Farmer for $2.00. These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER,

ST. JOHN, - N. B.

The Antigonish County Seed Fair.

Considering that last season was not a very favorable one in Nova Scotia, the exhibit of seeds in Celtic Hall Antigonish, N. S. was remarkably good. The number of entries received by the Secretary of the Fair was in excess of those received last year, the state of the roads prevented a few of the prospective exhibitors from coming iuto town,

The judging was done by Mr. Moore of the Seed Branch, Dep't of Agriculture, Ottawa, assisted by Mr. Alward of New Brunswick. In wheat and oats first honors went to Mr. Robert Chrisholm of Briley Brook. The exhibits in the wheat sections were excellent, Mr. Chrisholm and a few other farmers have for the last few years been selecting their seed according to the methods of the Dominion Seed Growers' Association, and the improvement in the quality of seed produced by them is marked, Mr. Chrisholm has this year already taken several first prizes with his grain, botn at the Amherst Fair in December, and at the January Provincial Seed Fair at Truro. We think it would be well for some few farmers in every district in the Country to take up work in this line, not simply because they would raise the standard of the seed in the country, but because the prices paid for such good seed are attractive. The oats, although not quite so good as the wheat, were, on the whole, good samples, and the different varieties of potatoes were pronounced of excellent quality. In hay seed we are yet somewhat backward. The first prize exhibit was good clean seed, but the others, although they were good seed, contained too many weed seeds. The ox-eye daisy, red sorrel and spurry were far too abundaut in them. The exhibits of this section, while showing the possibility of raising good hay seed in the Country, show want of care in their selection, a defect quite easily remedied and which should receive better attention next summer. The Broadfoot cup for white Russian wheat and Banner Oats was won this year for the second time, by Mr. Ronald Chisholm.

White Russian Wheat, 1, Ronald Chisholm, Briley Brook; 2, Alex McPherson, Cloverdale; 3, Thos. Hogan, Harbor; 4, Taylor Bros., Antigonish.

Dairymaid of Pinehurst, Makes Another Remarkable Record.

We have had in the past many instances illustrating the great capabilities of the Guernsey cow as a dairy animal. In fact, it may probably be truthfully said that it is due to her own efforts in this line that she has won the high esteem which she has among the progressive dairymen of the country. We are glad indeed to record here another chapter in the work of one of these dairy queens.

Dairymaid of Pinehurst 24656 was bred by Mrs. E. W. Strawbridge, Moorestown, N. J., and was dropped April 26, 1906. She well deserbes from her inheritance, as well as her individuality, the distinction which has fallen to her. Her dam, Dairymaid of Elm Place, 14197, Adv. R. 19, had an advanced Register record of 12176.90 pounds milk, 668.36 pounds butter fat. Her maternal grandmother, Dolly's Ada 9289, was said to be a great cow, and reported as having a record of 17 lbs. 1 oz. but-

ter before the days of the Babcock test in Advanced Register work.

Dairymaid's sire, Glenwood Boy of Haddon 4605, Adv. R. 8, belongs to the great Glenwood family, being a son of Glenwood Girl 2d 9108, and by Pat of Haddon 3919, Adv. R. 1, having four daughters in the Advanced Register.

HER FIRST RECORD.

Dairymaid of Pinehurst calved when 22 months of age, and immediately commenced her work in the Advanced Register. During this period she was milked twice a day, and yet we find her official year's record to be 7913.50 lbs. milk, and 405.51 lbs. butter fat. In this she exceeded her requirements by over 1900 lbs. milk and 155 lbs. butter fat. In addition we find that while starting her record 61 days less than two years old, she carried her second calf six months of this lactation period. Handicapped as she was by being so young, and she was a small heifer, and also by the tax on her of carrying the second calf during this lactation period, the record stands out as the most remarkable of the three she has made. It certainly warranted the conclusion that she was destined to be a great cow. At the time of this record it was the world's record of all breeds for so young a heifer and under these conditions.

AS A THREE YEAR OLD.

She next calved May 17, 1909, when she was 3 years and 11 days old, and started her year's work the first of June with the following results: 14562.4 lbs. milk, 860.26 lbs. butter fat. In this record she again exceeded her requirements, producing over 7100 lbs. milk and 510 lbs. butter fat more than was required. During this record she carried her calf two months. For eight months she was milked four times a day and for four months but three times. It was during this record that Dairymaid became a very prominent figure in that she was the winner of the Iowa State Dairy Cow Contest.

The Iowa Dairy Cow Contest has attracted a great deal of attention. It is doubtful if there has been anything in recent years that has awakened a greater interest in the dairy cow, and done more to emphasize the value of high-class, well-bred animals over the scrubs. The object was to determine the best dairy cow in the state and to give a practical illustration of the difference between a good and poor cow. The contest was won by Dairymaid, owned by Mr. W. W. Marsh of Waterloo, Iowa, who also owns the two Guernsey cows, Jedetta of Pinehurst 17434, Adv. R. 502, year's record of 15109.10 lbs. milk, 778.80 lbs. butter fat; and Glencoes Bo-Peep 18602, Adv. R. 1075 year's record, 13121.70 lbs. milk, 622.61 lbs. butter fat, who stood with Dairymaid as the three cows producing the largest amount of butter fat in the year.

HER THIRD RECORD.

We again find her calving Dec. 29 1910. She commenced her year's work Jan. 1, 1911, when she was 4 years, 255 days old, with the following results:

1911	Milk	Butter Fat	
Jan.	1803.60 lbs.	4.58 p.c.	82.60 lbs.
Feb.	1787.20	4.85	86.68
Mar.	1789.10	4.96	88.74
April	1610.90	5.20	83.77
May	1697.10	4.98	84.52
June	1438.20	5.11	73.49
July	1369.30	5.36	73.39
Aug.	1312.40	5.01	65.75
Sept.	1158.80	5.96	69.06
Oct.	1188.10	6.30	74.85
Nov.	1090.30	6.39	69.67
Dec.	1040.30	5.59	58.15
Ttoal	17285.30	Av. 5.27 p.c.	910.67 lbs.

During this period she exceeded her requirements by over 7700 lbs. milk and 562 lbs. butter fat, or to the

greatest extent of any of her three records. We find she was again carrying her calf during the record for two months. During this time she was fed the following:

21 lbs. grain daily of the following mixture: 8 lbs. bran, 10 lbs. ground oats, and 1.5 lbs. each gluten and oil meal; 4 lbs. beet pulp, 20 lbs. mangels, 10 lbs. ensilage, alfalfa and mixed hay.

23 lbs. grain daily of the following mixture: 8 lbs. bran, 12 lbs. ground oats, and 1.5 lbs. each gluten and oil meal; 8 lbs. beet pulp, 25 lbs. mangels, 30 lbs. ensilage, alfalfa and mixed hay.

14 lbs. grain daily of the following mixture: 8 lbs. bran, 3 lbs. ground oats, and 1.5 lbs. each gluten and oil meal; 8 lbs. beet pulp, 25 lbs. mangels, 30 lbs. ensilage, 5 lbs. alfalfa hay, 5 lbs. mixed hay.

21 lbs. grain daily same mixture as given in January, 6 lbs. beet pulp, 30 lbs. ensilage, alfalfa, and mixed hay.

21 lbs. grain daily same mixture as given in January, 4 lbs. beet pulp, 25 lbs. roots, 30 lbs. ensilage, green alfalfa and pasture.

21 lbs. grain daily same mixture as given in January, 4 lbs. beet pulp, green oats and peas, green alfalfa and pasture.

19 lbs. grain daily same mixture as given in January, 4 lbs. beet pulp, green oats and peas, green alfalfa and pasture.

1st to 15th, and 20th to 31st, 17 lbs. grain daily of the following mixture: 6 lbs. bran, 8 lbs. ground oats, 1.5 lbs. each gluten and oil meal; 4 lbs. beet pulp, 30 lbs. corn husks, green oats and peas, and green alfalfa. 17th and 18th, 2 lbs. bran and 4 lbs. ground oats. 19th, 2 lbs. bran, and 1 lb. each gluten and oil meal.

14 lbs. grain daily of the following mixture: 5 lbs. bran, 6 lbs. ground oats, 1.5 lbs. each glutten and oil meal; 4 lbs. beet pulp, 30 lbs. corn husks daily up to the 17th, after the 17th, 20 lbs. mangels, pasture.

21 lbs. grain daily same mixture as given in January, 25 lbs. mangels, green alfalfa, and clover hay.

21 lbs. grain daily same mixture as given in January, 30 lbs. roots, 20 lbs. ensilage, clover and alfalfa hay.

13 lbs. grain daily of the following mixture: 8 lbs. bran, 2 lbs. ground oats, 1.5 lbs. each glutten and oil meal; after the 19th, 3 lbs. daily pea meal, 30 lbs. roots, 20 lbs. ensilage, alfalfa hay.

THREE CONSECUTIVE YEARS' WORK.

We find that the above work shows an average for the three consecutive lactation periods of 13253.7 lbs. milk and 725.48 lbs. butter fat. Surely this is a lasting advertisement of the staying qualities of this cow and of the Guernsey breed. In this connection might be mentioned several other Guernseys which have also repeatedly increased their former records:

Selma of Pinehurst 14521, Adv. R. 325, with four yearly records, the average of the four being 10402.22 lbs. milk and 641.89 lbs. butter fat; Dolly Dimple 19144, Adv. R. 628, average for three years 17092.14 lbs. milk and 828.36 lbs. butter fat; Modena 11779, Adv. R. 67, average for three years 12705.00 lbs. milk and 665.08 lbs. butter fat; Dolly Bloom 12770, Adv. R. 40, average for three years, 12937.97 lbs. milk and 634.67 lbs. butter fat.

A WONDERFUL COW.

When one analyzes the work of this cow, they cannot but be impressed by her remarkable ability. In every instance she has not only made more than good her requirements,, but in each of her three year's records her gain has been greater than that of her preceding milking periods. It plainly demonstrates that cows making large records not only do come back but are able to exceed their previous work.—Guernsey Breeders' Journal.

See cut on page 422.

"Eastlake" Steel Shingles

will save you money

Just ask yourself this question Mr. Farmer, "Is my barn roof lightning proof—is it fireproof?

It's not a cheerful sight to see your barn—full to overflowing with the season's crop—wiped out by lightning or a spark from the threshing engine.

All because of faulty roofing.

A fireproof roof is the only **sure** protection for your crops, your livestock and implements.

"Eastlake" Steel Shingles are absolutely **lightning-proof, fire-proof, storm-proof and vermin-proof**—the best and safest roofing for all buildings.

"Eastlake" Metallic Shingles are made of the finest galvanized steel—are easiest and quickest to lay—save labor and expense.

"Eastlake" Shingles cost less than a wooden roof equipped with lightning rods.

"Eastlake" Shingles make the best roofing for you, Mr. Farmer.

Roofs covered with **"Eastlakes"** a quarter of a century ago are in perfect condition to-day. This is the best guarantee for you.

Send for our illustrated booklet, **"Eastlake Metallic Shingles."** Write to-day—just your name and address.

We also manufacture Corrugated Iron, House and Barn Siding, Metallic Ceilings, Cornices, Eavetrough, Conductor Pipe, Ventilators, etc.

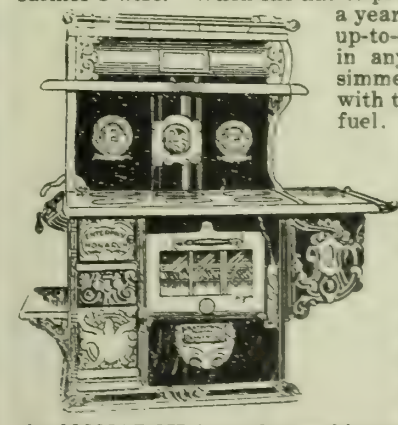
No Sane Farmer

will try to run his farm on a paying basis without proper implements and appliances for doing good work, and it should be the same with the farmer's wife. When she has to prepare three meals a day for 365 days a year, she should have in her kitchen an up-to-date range on which she can depend in any emergency, for broiling, baking, simmering or boiling to the best advantage with the smallest possible consumption of fuel.



THE ENTERPRISE MONARCH STEEL RANGE

will do all this, and in addition it is specially adapted for farm work as it has a large fire box for wood burning and large copper reservoir giving ample supply of hot water. Then the MONARCH is so thoroughly constructed that it is not necessary to send to town every few months for repairs.

Ask your wife if she does not want a MONARCH. It may add years to her life by lessening labour and saving time.

WOMAN'S MOST SUCCESSFUL MEDICINE

Known All Over The World —Known Only For The Good It Has Done.

We know of no other medicine which has been so successful in relieving the suffering of women, or received so many genuine testimonials, as has Lydia E. Pinkham's Vegetable Compound.

In nearly every community you will find women who have been restored to health by this famous medicine. Almost every woman you meet knows of the great good it has been doing among suffering women for the past 30 years.

Fox Creek, N. B.—"I have always had pains in the abdomen and a weakness there and often after meals a soreness in my stomach. Lydia E. Pinkham's VegetableCompound has done me much good. I am stronger, digestion is better and I can work with ambition. I have encouraged many mothers of families to take it as it is the best remedy in the world. You can publish this in the papers."—Mrs. WILLIAM S. BOURQUE, Fox Creek, N. B.

In the Pinkham Laboratory at Lynn, Mass., are files containing hundreds of thousands of letters from women seeking health, in which many openly state over their own signatures that they have regained their health by taking Lydia E. Pinkham's Vegetable Compound, many of whom state that it has saved them from surgical operations.

Sussex, N. B.

Guernseys.

In the Maritime Farmer of March 12, 1912, I notice a good description of Guernsey cattle. We have kept pure-bred Guernsey cattle for a number of years and at the present time have about twenty-five head of pure-bred and fifteen head of Grade cattle.

The only record I ever kept, was of one cow, Bella of Eastview for one year, 1908. I bought this cow from J. Rigg Brow, when three months old for seventy-five dollars. She tests about 5.4. Now the year the record was kept of this cow she did not get any more feed and no more attention than the other cows and we had about ten milking at the time. The cows were taken care of by hired men altogether.

Bella of Eastview calved in December and again the next November, making seven weeks dry out of the year.

The following is the amount she earned at the creamery from December 13, 1907 to December 13, 1908.

Dec.	.....372.....	.....16.10.....	.....$ 5.86
Jan.	.....901.....	.....39.64.....	..... 11.29
Feb.	.....640.....	.....30.72.....	..... 9.06
Mar.	.....585.....	.....29.25.....	..... 8.77
Apr.	.....664.....	.....35.85.....	..... 11.65
May	.....583.....	.....29.15.....	..... 7.29
June	.....597.....	.....29.85.....	..... 7.17

Dec.	.....310.....	.....15.63.....	..... 4.74
			91.97

The bull calf she had in November sold for $60.00, when six months old, making a total of $151.97 for the year. I think if this cow had been fed up and forced she could almost have doubled the amount of milk.

I have recently purchased from Conn., U. S. A., a fine bull calf named Canada's Jethro Bass. He is sired by Jethro Bass, No. 11366, whose dam is Dolly Bloom (record 17297.5 lbs. milk, 836.2 lbs. fat). Dolly Bloom is dam of the World's Champion three-year-old heifer of All breeds—Dolly Dimple.

Mrs. L. D. Corbett, of this place, has two nice grade Guernseys. In the year 1911 she kept a record of her milk which amounted to $143.46. These cows dropped calves during that time.—T. D. Blaikie, Great Village, N. S.

Low Grade Nitrate.

Several cases of low grade Nitrate have in the past appeared on the market, and I am writing you to suggest that you advise correspondents to purchase Nitrate from trustworthy dealers only. One adulterant is Common Salt, and sometimes Salt Cake has been used. Both are worthless as fertilizers and contain no plant food. It is preferable to purchase Nitrate in original bags which now contain about two hundred pounds.

As far as the Chilian Producers of Nitrate are concerned, however, the greatest care is taken, and samples are drawn by Inspectors from all cargoes before they leave the Ports of Chili, and heavy fines would be imposed upon any Producers who attempted to export low grade Nitrate. Salt Cake residue made as a by-product in the manufacture of Nitric Acid has also been used to adulterate Nitrate, and in certain cases has been sold as Niter-Cake. This name tends to give it a false value. It is also worthless as plant food. On our part, we have done all that is possible to maintain a high standard, and that our policy will be the same in the future you may be fully assured, and I hope that you will be able to co-operate with us in helping to prevent sales of low grade Nitrate, which we would greatly deplore.—William S. Myers.

A Sign of the Times

PEOPLE are becoming very careful about what they eat and drink—

The preference for goods in sealed packages —especially in food stuffs—**is now quite definite** and becoming more so every day.

We must frankly admit that there are **sound reasons** for this preference. Food stuffs **cannot** be exposed to varying atmospheric conditions without **losing** both strength and flavor.

Tea—of all articles of everyday diet (excepting coffee, perhaps) needs protection most, and best merchants have been quick to appreciate the fact. So much is this the case that the selling of loose Tea in bulk will soon be a thing of the past.

RED ROSE TEA reaches you with all its virginal flavor, strength and purity—

—It is sealed in air-tight packages—dust and damp-proof—

RED ROSE is a blend of the best Indian and Ceylon Teas.

—The former assures generous strength and richness—the latter **that** coaxing, delicate flavor, Qualities for which Red Rose Tea is famed.

Ask your Grocer for the 40c. package of Red Rose and you'll get **better** Tea—Tea that spends farther—for the same money.

You want "Good" Tea—well,

"Red Rose Tea is Good Tea"

Presentation to Dr. Rutherford.

A fitting tribute, on the occasion of his retirement from office, was made recently to Dr. J. G. Rutherford, when the members of his Staff of the Health of Animals and Live Stock Branches, in token of their regard and esteem, presented him with a beautifully illuminated address and purse of gold. The presentation was of a very informal nature and was made in Dr. Rutherford's office, in the presence of the staff of the Inside Service and of a few other officers whose duties had called them to Ottawa for the day. The address, artistically illuminated by the Rev. Mr. Bousfield and bound in green vellum, fittingly referred to Dr. Rutherford's important and honourable service to the Dominion during his ten years' tenure of office, and cordially and gratefully acknowledged the value, to the members of his staff, of their association with him in the direction of work at once difficult, delicate and yet vital to the interests of the country and which called for the exercise of administrative and executive ability of the highest order.

Dr. Rutherford is a born administrator and there is no doubt that recognition of and admiration for his splendid talents, as displayed in the prosecution of whatever he undertook, impelled such a fine expression of appreciation as exhibited in the splendid gift of $1200.00 in gold which accompanied the address. Contributions were sent from officers stationed in every province of the Dominion and, as well, from an inspector who forwarded his subscription from his headquarters in the Yukon Territory. Two hundred and fifty names have been inscribed in the margin of the address as contributors to the testimonial and, in their own way, attest the fact that the retiring Veterinary Director General and Live Stock Commissioner in his future career will be followed by the cordial respect and good will of his former staff.

Wintering Bees in Charlotte Co., N. B.

Editor Maritime Farmer:—

My fifteen years experience in wintering bees outside and also by the cellared method has convinced me that good colonies wintered on their summer stand if properly packed are much stronger and better prepared to gather the surplus honey when it comes.

I will tell how I pack my hives for wintering in a future issue.

I have found my cellared bees noisy and spotting their hives badly so I set them out for a cleansing flight. The following day I moved them back again and to-day they are very quiet and have every indication of coming out again, about April 15th, in good condition. I predict a loss of thirty per cent. of colonies before May 1st, this year. This, I attribute not to our long cold winter but to the inexperience of the beekeepers who do not know what to do or when to do the right thing.—R. L. Todd, Charlotte Co., N. B.

P. E. I. Jerseys For Charlotte Co.

Robt. L. Todd, of Milltown, N. B., has purchased from Frank Glydon & Son, Margate, P. E. I., the registered Jersey Cow, Mary Orin 2nd and the six months old Jersey Calf, Miss Thelma. They were shipped to their new owner by rail a few weeks ago.

BEAVER FLOUR

You can't judge quality by size—and this applies to bread as well as to men.

YOU may have an idea because western wheat flour makes a big loaf of bread, that the quality is in keeping with the size. The largest men have not accomplished the greatest deeds.

Size is the only feature that can commend western wheat flour to any cook. And the good cook quickly discovers that quantity without quality is not worth buying.

"BEAVER" FLOUR GIVES BOTH QUALITY AND QUANTITY, because it is a blended flour. It is mostly the choicest Ontario fall wheat with sufficient Manitoba spring wheat to equalize the strength.

In "Beaver" Flour, you get the famous pastry-making qualities of Ontario wheat—you get the fine texture, the evenness and the delicious flavor of Ontario wheat—you get the nutriment of Ontario wheat—with the "strength" of Manitoba wheat which makes the dough "stand up" in the oven.

One of the big conveniences of "Beaver" Flour is the fact that it is equally good for bread and pastry—and best for both.

"Beaver" Flour is superior to any western wheat flour for any and all kinds of baking, and is the cheapest flour you can use because the most economical.

DEALERS—write us for prices on Feed, Coarse Grains and Cereals.

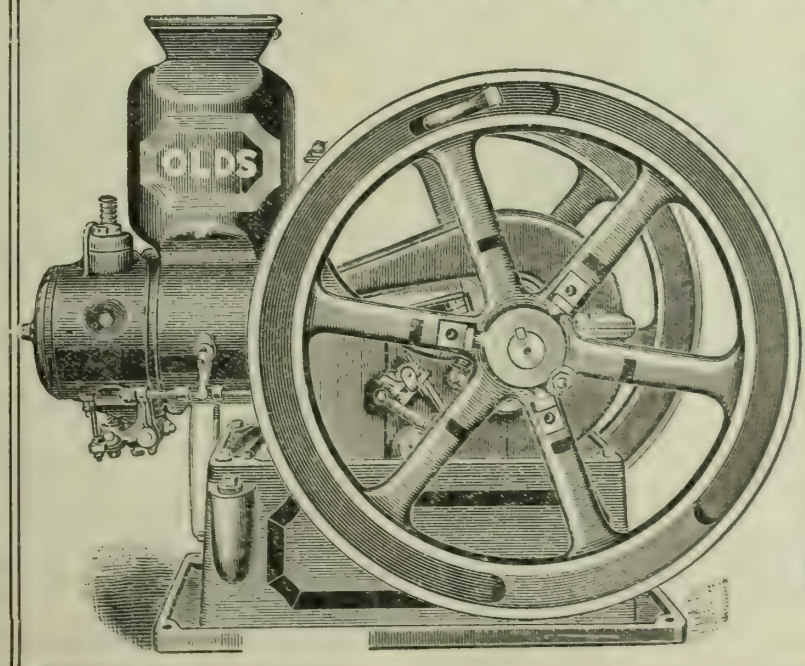
THE T. H. TAYLOR CO., Limited, - - CHATHAM, Ont.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

BRONCHITIS

Was So Choked Up She Could Hardly Breathe.

Bronchitis is an acute inflammation of the mucus membrane lining the air tubes of the lungs, and should never be neglected, for if it is very often the disease becomes chronic, and then it is only a short step to consumption.

On the first sign of bronchitis Dr. Wood's Norway Pine Syrup should be taken, and thus prevent it becoming chronic.

Mr. John D. MacDonald, College Grant, N.S., writes:—"My little girl, seven years old, caught a bad cold which developed into bronchitis. She was so choked up she could hardly breathe. Reading about your wonderful medicine, Dr. Wood's Norway Pine Syrup, I decided to try a bottle, and with such good results that I got another which completely cured her. I cannot say too much in its praise, and would not be without it in the house."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; three pine trees the trade mark; price, 25 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont. will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Oyster Scale Bark Lice.

G. F. W., Amherst, N. S.:—I am forwarding you a twig from one of my apple trees. These trees were apparently healthy until within the last year. Please let me know what the trouble is and how to overcome it?

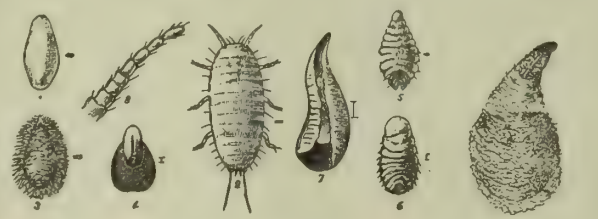
Ans.—The apple tree twig submitted is badly infested with oyster scale bark lice. The Oyster-Shell Bark Louse (Mytilaspis Ulmi) ranks next to the San Jose Scale, the enemy of fruit trees. It is found everywhere throughout the provinces and inflicts an immense amount of damage on apple and other fruit trees; it is especially abundant in old and neglected orchards. Fortunately it is single-brooded and therefore does not increase very rapidly. It may be readily identified by its peculiar shape, which resembles that of an oyster shell, and may usually be found in large numbers, sometimes completely encrushing the bark of twigs and branches; occasionally individuals ever make their abode on the fruit. During the winter the insect is in the egg stage, and protected by the old scales; about the end of May and beginning of June, the yellow lice are hatched out and wander about for a short time, looking for a suitable place where they may attach themselves to the bark. This is done by inserting the beak into the tissue, and there the creature soon becomes covered with a scale and remains for the rest of its life sucking the sap of the tree. Twice in the season the insect sheds its skin and assumes a larger one, leaving the cast-off portion still attached to the new. In autumn the adult female lays her eggs and dies.

Remedies:—Good results may be obtained by a thorough wash with lime (one pound and a half quickly slaked to a gallon of water) applied after the leaves fall in the autumn and again before the buds open in the spring. When the lice are first hatched out and are running onthe limbs, (during the latter part of May or first of June) they may be destroyed with kerosene emulsion which is made as follows:

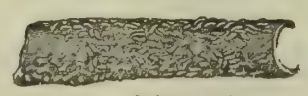
Kerosene.....	2 gallons
Rain Water.....	1 gallon
Soap.....	1 pound

Boil the soap in water till all is dissolved; then, while boiling hot, turn it into the kerosene and churn the mixture constantly and forcibly for five minutes, when it will be of a smooth creamery nature. Before applying to your trees dilute this emulsion by adding twenty-seven gallons of water, or in other words dilute with nine times its own volume of water and apply as a spray.

If you white-wash your trees now and follow with the kerosene emulsion spray when the lice hatch out in summer we believe you can rid your trees completely of this troublesome pest.



Oyster-shell Bark-louse. A Scale, greatly enlarged.



Scales on a twig.

Dairy Instructor for Nova Scotia.

Mr. W. A. MacKay, who, for the past three years has been in charge of the Scotsburn Creamery, Pictou Co., N. S. and has made such a splendid success of it, has been appointed Dairy Instructor for the Province of Nova Scotia, with headquarters at Truro, N. S. During the coming summer his services will be available in any sections where Creameries are now established, or in sections where it is purposed to establish Creameries. Mr. MacKay has had a long and successful experience in butter and cheese making and in the management of Factories and we believe that this appointment will be highly appreciated by all those who are interested in the development of these Factories in Nova Scotia. Should any in the province be interested in securing Mr. MacKay's services at an early date, they should at once correspond with M. Cumming, Secretary for Agriculture, Truro, N. S.

For New Vitality Send Me The FREE COUPON

There is to.day no excuse for any man remaining weak. The vital, manly man is admired by all men as well as all women; there is an influence about him no one can resist; he knows no fear; he knows no weakness; he knows no result of debility. It is this same VITALITY which carries our young soldiers to war without thought of death. Vitality, reader, is what you MUST have if you would enjoy a life of health, strength and manly vigor. I can give you this same life and vitality; if I can do for you what I am doing for thousands of others I can put the vigor of youth into your blood and nerves; I can make you feel young again and keep you feeling young; I can drive away all dibility, weakness and despondency. You will laugh at trouble, you will tackle obstacles with the vim to win, just as all other hearty vital men may do. I don't ask you to use drugs. I ask no change in your present mode of living; just cease all dissipation and then use my HEALTH BELT. All else will come. My Health Belt with suspensory attachment is the greatest nature cure and VITALITY supply that the world has ever known or probably ever will know. Nothing is taken for granted: you feel better immediately, at once, from the first time used. Worn all night, while you sleep, it pours a great stream of Vitality and energy into your weakened system: it is a wonder-working giant of power; made as I now make it, I am getting results of which no man ever dreamed. Just think, over ten thousand men applied to me during the month of February. I am now sending great shipments of my Health Belt to every part of the civilized world. There is a reason, I am curing; I am giving men back their lost strength. It makes you feel ambitious, full of vim; you awaken mornings sparkling with bright, clear-eyed, clear-brained health; the weakness has all disappeared from your back; you are "just feeling fine." Special attachments to my Health Belt cure rheumatism, kidney, liver and stomach trouble.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man, young or old, who would be strong in manly vigor. It is a word of hope, a carefully written, interesting booklet, which should be in everyone's possession. Therefore, send to-day. If in or near the city, call at my office.

DR. M. F. SANDEN CO. 140 Yonge St., TORONTO, ONT.

Dear Sirs:—Please forward me your Book, as advertised, free.

What New Brunswick has to Offer the Immigrant.

(Continued from page 458).

well and ably represented in our Province. Magnificent Churches in our cities and towns with those of more modest pretentions in our rural districts everywhere abound, and with the large staff of earnest and faithful Clergy, we are fortunate to have in our midst and the earnest workers among the Layety, the immigrant need not fear of his being unable to find a Church home among us, where he can worship his God according to the leadings of his own particular faith.

In brief we have referred to the advantages New Brunswick has to offer the immigrants. For a brief minute let me specialize some of them. So far as records are available we have abundant proof of the health-giving properties of our climate conditions. A very large percentage of our people live to a good old age, particularly those who live on the land are blest with vigor of mind and body. These facts apply from the earliest settlement of the Province until the present day.

If you ask for proof, let me refer you to the splendid march of the gallant 104th Regiment in the War of 1812, raised in New Brunswick, which left St. John on the 11th day of February and on the 27th day of the same month crossed the St. Lawrence on the ice and entered Quebec 1000 strong, accomplishing a march of 435 miles in midwinter in 16 days, without the loss of a man,—equal to 27 1-5 miles per day. This march of the 104th, accomplished by men in midwinter on snow-shoes, poorly fed and insufficiently clad, is a matter of record and will go down through the centuries as a wonderful feat of endurance made to defend Canadian homes from a foreign invader. What a splendid tribute the late Duke of Wellington paid the officers and men who performed that wonderful march when he said that it was the only accomplishment of a British officer that he envied.

As to the conditions of general agriculture, let me say that, from the St. Croix to Edmundston and following the valley of the St. John and its tributary rivers and streams, there lies a country of great wealth in agricultural resources. The Valley of the St. John is among the first portions of the Province settled and while the whole Province was known as the County of Sunbury in Nova Scotia, with Halifax as its capital. There in the Parishes of Sheffield and Maugerville, the first pioneers of New Brunswick (outside of those settlers around the Harbour of St. John) began their work of wrestling from Mother Earth a living for themselves and families. The rich alluvial soil produced abundantly, inspiring hope and courage among them, and supplying their daily wants.

On the Eastern and Northern sides of the Province, splendid conditions exist, extending from the Tantramar River to the Metapedia, the Westmorland marshes on that river, the marshes on the Memramcook and those on the Petitcodiac are not only very extensive, but very productive as well. All along the Coast of the "Straits of Northumberland" are fertile lands, especially on the Cocane, Buctouche, Miramichi and Restigouche Rivers.

In fact, for the number of square miles of land New Brunswick possesses, there are less unfruitful acres than is supposed. All the northern part of the Province has an exceptionally good soil. Taken altogether we should be proud of our heritage and strive not only to keep our own sons and daughters on the Home Land, but increase and place upon the land awaiting settlers, the best type of immigrants that it is possible to secure.

Every I H C Wagon is Inspected Four Times

HOW do you buy a wagon? Do you wait till you need one and then take the first that's offered you, or do you find out in advance which wagon will give you best service, and buy that one? Why not get as much as you can for your money? Buy the wagon that will stand up for the longest time and be easiest on your horses. That wagon is an I H C wagon. Here is why: Each I H C wagon is thoroughly inspected. I H C wagons—

Petrolia **Chatham**

have just one standard—the highest. The lumber used is selected from large purchases. Every stick of this lumber is carefully inspected. Another inspection is made when the parts are ready for assembling. This inspection assures perfect shaping and ironing.

The third inspection, when the wagon is ready for the paint shop, covers all the points of superior construction for which I H C wagons are famous. Bearings are tested, every bolt and rivet is gone over, the pitch and gather of the wheels are verified. When this inspection is finished, the wagon is up to standard everywhere, good enough to be stamped with the I H C trademark.

The final inspection is made when the wagon is ready for delivery. Four inspections to make sure that you get everything you pay for.

All these inspections are for your benefit, so that any farmer who owns one can say with truth, "My I H C wagon is perfectly satisfactory." The I H C local agent will show you the wagon best suited to your needs. He will supply you with literature, or, we will send it if you write. Address—

I H C Service Bureau

The purpose of this Bureau is to furnish, free of charge to all, the best information obtainable on better farming. If you have any worthy questions concerning soils, crops, land drainage, irrigation, fertilizer, etc., make your inquiries specific and send them to I H C Service Bureau, Harvester Building, Chicago, U S A

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 25 cents a week, or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

BANNER "BUGGY" LANTERN

Is on the side of the vehicle and lights the road.

WHITE AHEAD.

RED BEHIND.

Drive in Safety!

ONTARIO LANTERN & LAMP CO.,

Limited, Hamilton, Ontario.

Our winter students are now leaving us. Others are taking their places. So we are ever changing; new faces, new features in our work, new conditions to provide for in the business world. Thus our work goes on in increasing volume, the increase for the last two years being much greater than ever before.

No better time for entering than just now.

Our catalogue for the asking.

S. KERR, Principal.

THE ST. JOHN Business COLLEGE. S KERR & SON.

To whom it may concern: This is to certify that I have used MINARD'S LINIMENT myself as well as prescribed it in my practice where a liniment was required and have never failed to get the desired effect.

C. A. KING, M. Df

WHY HE WAS LATE.

"What made you so late?"

"I met Smithson."

"Well, that is no reason why you should be an hour late getting home to supper."

"I know, but I asked him how he was feeling, and he insisted on telling me about his stomach trouble."

"Did you tell him to take Chamberlain's Tablets?"

"Sure, that is what he needs." Sold by all Dealers.

S. C. Rhode Island Reds Exclusively.

I have made a specialty of this one breed, and keep nothing else. After trying many varieties, we have decided this is the best all round purpose fowl for this climate. For beauty and utility we believe it has no equal.

2 pens bred to lay, and we can guarantee these birds will lay you lots of eggs in the coldest weather. $1.50 setting 15.

1 pen extra fine birds headed by a cock from Lester Tompkins. direct, $3.00 for 15 eggs.

Try the Red-bird for happiness.

Demonstration Orchard Work in New Brunswick.

(Continued from page 465.)

While the returns from this orchard are very satisfactory indeed, yet it is well to point out that they might have been considerably greater had the bulk of the orchard been planted to higher selling varieties like the McIntosh Red and Fameuse. The owner, Mr. H. L. Steeves, is in the apple growing business to stay, and last spring planted 300 trees and next spring will plant 900 trees, mostly McIntosh Red and Fameuse.

SUMMARY.

SUNBURY COUNTY ORCHARD.

Net profit on 1 2-3 acres..... $93.15
Net profit per acre..... ..... 55.89

Which on a valuation of $450.00 is a return of almost 14 p.c.

YORK COUNTY ORCHARD.

Net profit on 1½ acres..... $133.05
Net profit per acre..... ..... 88.56

Which on a valuation of $150.00 per acre is a return of 59 p.c.

ALBERT COUNTY ORCHARD.

Net profit on 3 acres..... $545.12
Net profit per acre..... ..... 181.70

Which on a valuation of $500.00 per acre is a return of over 36 per cent.

Pulping Roots for Stock.

C. R., Lunenburg Co., N. S.:—I have a Shorthorn cow, 10 years old, that freshened six months ago. She has not come in season since, although she is in fine flesh. Last fall she leaped on one of the other cow's and in doing so slipped and hurt her leg so that she was lame for three months, but she is all right now.

How much salt should a cow have each day? Do pigs need salt? Should roots be pulped for stock?

Ans.—The cow not having come in season is not an uncommon occurrence; but it is difficult to say why, even on careful examination. The generation apparatus is a complicated one and very sensitive, so that slight derangement is sufficient to interfere with its regularity. Many cows behave this way and afterwards become regular. I cannot offer a remedy, not knowing part affected, which may be the ovaries, the follopian tubes or the uterus, any or all of which may recover with the coming of warm weather.

The quantity of salt advisable for a cow is what she will consume of her free will; some cows desiring and requiring more than others. If rock salt be placed where the animal can lick it at will any time, they will partake of it in satisfying quantity and will not injure themselves; but if deprived of it for sometime and allowed to consume a large quantity they may take too much. Men differ in their desire for salt and so do cows; but salt should be supplied as advised, not put in food and thereby compelling the animal to consume the salt or do without the food. The person who advises exact quantities of salt or food for all cows alike does not know much about cows.

If sufficient help is available, it will pay to pulp the turnips, particularly for calves and aged cows whose teeth are not so strong as they used to be. Cows that have good teeth can do their own pulping very well, if farm labor is scarce. For dairy cows we would pulp our turnips to conserve as much as possible of the cows' energy for milk production. Other than in the cases above specified. The turnips may be ecinomically fed whole.

Pigs are the better of salt and if obtainable at all times they will partake of sufficient but not an injurious amount. Pigs as well as other animals have salt in most tissues and hence require it.—. Standish, N. S.

"VANCO" Lime Sulphur Solution

will keep your fruit trees free of Scale, Parasites and Fungi.

It is strong, uniform, clear, efficient—the strongest perfect solution that can be made and far superior in every way to home-made mixtures.

The Canadian Government Bulletin proves this. Specific Gravity on every barrel, to protect you.

"VANCO" Arsenate of Lead

will destroy all leaf-eating insects — never burns — sticks longer. The largest order ever placed for Spray Chemicals by any Canadian Fruit Growing Company, was for "Vanco" Lead Arsenate.

"Vanco" Fertilizers—Muriate of Potash — Sulphate of Potash — Acid Phosphate—Nitrate of Soda. We are the only house in Canada selling straight fertilizing chemicals of guaranteed analysis.

Save Freight—by ordering Sprays and Fertilizers together and having us make one shipment of the lot.

Send for the "Vanco" Book—study it—and spray for fall profits.

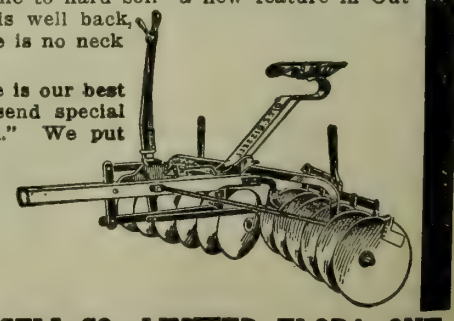
The "BISSELL" out-throw DISK HARROW

To settle all doubt about which is the BEST OUT-THROW DISK HARROW, we ask you to test the "Bissell" Out Throw in a field competition with other Out Throw Harrows.

The "Bissell" Out Throw has many features that have made the name "Bissell" famous in connection with Disk Harrows. It has plates of the correct shape. One gang is set slightly ahead of the other. The gangs cannot crowd or bump together and cause the Harrow to rock when you come to hard soil—a new feature in Out Throw Harrows. The hitch is well back, the draught is light and there is no neck weight.

The machine in actual use is our best advertisement. No need to send special travellers to sell the "Bissell." We put our name on every Harrow. If you would like to learn more about Disc Harrows, send to Dept M for free booklet of both out-throw and in-throw styles. 58



T. E. BISSELL CO., LIMITED, ELORA, ONT.

Something New in Timepieces.

The alarm clock of today is about thirty-five years old. It is essentially American, being first invented and patented by an American.

It has been but little changed and improved during its life. Perhaps it is slightly lower in ptice and cheaper in construction but otherwise the same old noisy day-starter.

Battered by years of competitive strife,flimsly noisy, unslightly, it has become a short-lived bargain,the constant butt of the cartoonist's joke. But out of Illinois has come a candidate for national favor along this line that is sweeping the country.

This master alarm timepiece—the newest developement in time recording instruments—is known as BIG Ben. It is made by the Western Clock Co. of LaSalle, Illinois. It is a clock of most beautiful appearance, a thin beautiful punctual sleepmeter with a quiet running motor, selective alarm calls, a mellow pleasing voice and a frank open attractive face.

BIG BEN is mounted in a massive dustproof, triple-plated case with large easy winding keys and reinforced suspension points. Farmers whose time means money to them can not afford to rely on a cheap, inaccurate, uncertain alarm clock.

Such well known jewelers as Birks of Montreal, Ottawa, Toronto, Winnipeg and Vancouver, Ryrie Bros. of Toronto, Dingwall and Port & Markle of Winnipeg have already endorsed Big Ben as well as hundreds of other jewelers and watchmakers.

The Western Clock Co. state that Big Ben is sold anywhere in Canada at $3.00. They publish some very interesting literature about Big Ben that would be well worth sending for The address of the Western Clock Company is LaSalle, Illinois.

Erratum.

In Bulletin No. 230 of the Inland Revenue Department, Ottawa,the Chief Analyst of the Department corrects an error in the previous Bulletin No. 227. On page 9 Sample of fertiliser No. 4548, the Bulletin stated in mistake that the sample was deficient in phosphoric acid Mr. A. McGill Chief Analyst in correcting the mistake says,—"The correct Registration Number is 142, and guaranteed phosphoric acid is 7 per cent. We find 8.45 per cent phosphoric acid as reported. This fertilizer, "Special Odourless Potato Phosphte" No.45486 is therefore fully up to guarantee."

Summer Hill Yorkshires.

In the Yorkshire Section of our Breeders' Directory Column in this issue will be found the announcement of J. W. Callbeck & Sons, Summer Hill Dairy and Stock Farm, Summerside P. E. I. The Summer Hill Yorkshire herd is one of the oldest and most successful show herd in the Maritime Provinces. The herd is always shown in good fit, and that the individuals are of good type is shown by the high places they occupy in the list of prize winners.

The Maritime Farmer a Stock Mover.

J.F. Roach. Sunnyside Stock Farm Sussex, N. B. writes:—During the year 1911 I sold 28 head of pure bred Ayrshires and Guernseys. Some of these went to the Province of Quebec and as far in the United States as Laramie, Wyoming. During the three months, January, February and March, 1912 I have sold 13 head for breeding purposes. The only advertising medium I use is the Maritime Farmer. The results as given above speak louder than words can express.

The Paint That Is Easiest To Apply

is surely the paint you ought to buy when there's anything you want to paint. M-L Pure Paint spreads so evenly and easily that it satisfactorily covers more surface than most other paints.

M-L MAPLE LEAF **PURE PAINT**
Best You Can Buy

also leaves the smoothest, glossiest surface—and takes the least paint to do a good job. Wears longest, too. Any surface it covers will not need re-painting for the longest possible time. That's why M-L Pure Paint is by far the most economical paint you can buy. Try it. Note the clear, clean colors and the beautiful gloss it gives. Only purest materials and skilful mixing can make paint like that!

THE exceptional durability of M-L Pure Paint is due to a special ingredient which we alone have learned how to mix with other pure materials to make a paint that is not easily affected by extremes of wear or weather. You get the biggest money's worth in M-L Pure Paints.

Made in 47 colors for all paint uses by Imperial Varnish & Color Co., Limited, Toronto.

USE M-L FLAT WALL COLORS to obtain pleasing and artistic treatment of walls and ceilings. Best for up-to-date stencil decoration—sanitary, washable, durable, very economical. 16 shades. Easily applied. Full directions with can.

MONEY IN POTATOES

You Bet There's Money in Potatoes If Properly Cultivated

Last year, the average selling price all over Canada was 60c. a bushel, against 45c. in 1910. The demand for potatoes is increasing each year; they are used in every home in Canada. Last year, Canada's Potato Crop increased in value OVER SIX MILLION DOLLARS. The demand is getting greater each year, consequently, more potatoes will have to be grown to feed the people of Canada. It is up to you to grow this supply to fill this demand.

Why should you not when the average price in Toronto during the month of February was $1.60 per bag in carload lots and the average cost of production and marketing is 22c. per bushel.

"O.K. Canadian" Potato Cutter, and Planter

These Machines take all the hard work out of the Potato Crop

"O.K. CANADIAN" POTATO CUTTER—for cutting seed potatoes—is the handiest little implement on the farm at planting time—and costs so little that you can't afford to waste time doing the work by hand. It cuts from 5 to 7 bushels an hour — cuts potatoes in uniform, blocky shapes—with eyes on each piece. You can cut only about one bushel an hour by hand.

We also make Cattle Stanchions. Sanitary Stalls and Water Bowls.

"O. K. CANADIAN" POTATO PLANTER is as easy to operate as a horse rake, and it does all the work. It opens the trench—drops the potatoes at any distance you set—puts in the fertilizer if you wish—covers the seed with moist soil—and marks for the next row. All you have to do is to drive the horses and keep the hoppers filled with seed and fertilizer.

It plants from 4 to 6 acres a day—plants round or cut seed—and the special shape of the carrying cuts prevents seed being bruised.

Make up your mind that you are going to make money out of Potatoes. Sit right down—clip out and fill in the coupon—and send it off to us to-day.

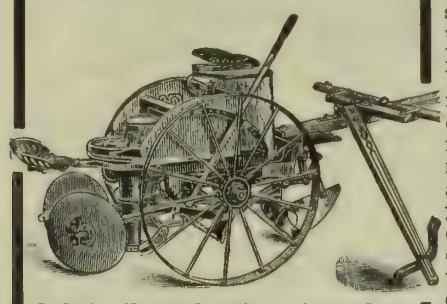
MORE POTATOES PER ACRE

Do you want to increase your potato crop 10 to 57 bushels per acre and thereby increase your profits $5 to $57 per acre?

The Iron Age Planter is the one machine with which an absolutely perfect stand can be obtained. At the Maine Experiment Station the yield where the

IRON AGE

was used was 57 bushels per acre more than where one of the best of the "Picker" machines planted. It makes no misses, no doubles, injures no seed



In Idaho, Herbert Lambing, a former Iowa Agricultural College student, has gained attention by his big crops, due to scientific methods. He writes in part; "The *Iron Age* means just one half my crop this year." Let it secure for you a perfect stand, a bigger yield and more profit. Ask your dealer to show you the Iron Age Planter, with or without fertilizer attachment. Write us for special booklet and Mr. Lambing's complete letter. Both will interest you. This planter is but one tool in our complete line of Iron Age farm and garden implements. You should know them all.

THERE IS NO REASON WHY WOMEN SHOULD DREAD CHILDBIRTH NOW. 19

Mothers' Cordial or Herbal Tonic makes childbirth easy and insures safe and rapid recovery. The Cordial is a compound of certain Indian herbs, blended in their proper proportions, and contains no drugs or harmful stimulants.

Mothers' Cordial or Herbal Tonic besides being a blessing to expectant mothers is also a potent remedy for all women in a rundown condition. In addition to its tonic properties it is an excellent blood purifier, and serves to clear the complexion as well as improve general health and good spirits.

Davidson, Feb. 21st, 1912.

Dear Mrs. Currah.

I am writing you for another box of Orange Lily and a box of the Herbal Tonic, inclosing an order for Two Dollars for same. Please forward same to me.

I find an occasional use of the Orange Lily helps me and the Tonic is a good spring builder.

Yours sincerely,
MRS. J. W. A.

A package of Mothers' Cordial or Herbal Tonic lasts a month. At your Druggist's, or by mail, $1.00 a package, postpaid, or 6 packages for $5.00.

Cow Testing, the Indication of Real Dairying.

(Continued from page 466).

we furnish sulphuric acid and preservative together with all record farmers, and pay any maker at the local factory provided he is thoroughly competent, five cents for each test each month.

May I enlist the cordial co-operation of the officers and members of this association, as well as the active sympathy of every factory owner, every cheese and butter maker to extend this work as rapidly as possible. I have personally mailed scores of circular letters and bulletins which is about as far as we can go till the farmers themselves evince some little interest in what concerns them so closely. No government can legislate good crops or good cows, but this matter of cow testing is most heartily recommended to you, on its merits of simplicity, immediate value and permanency. To any man keeping twenty cows it means an extra income of $400 or $500 per year, besides the intense satisfaction of knowing that none but profitable cows are kept. With but slight effort the dairymen of New Brunswick can easily increase the income from the present number of cows in the province by the substantial sum of two million dollars. Is not this worth having.

Feed Value of Cottonseed.

A reader sends the following questions: At the present price of cottonseed meal, allowing standard value for carbohydrates and fat, what is the cost per pound of protein? Also allowing standard price for phosphoric acid and potash, what is the cost of nitrogen per pound?

The first half of query is difficult to answer, as regards the cost of protein. Let us take the nitrogen question first. Cottonseed meal is worth $35 a ton to-day. The average of some 350 samples showed cottonseed meal to carry 7.16 per cent. nitrogen, 2.97 per cent. phosphoric acid, and .019 per cent. potash. Hence in a ton there are 143.2 pounds nitrogen, 59.4 pounds potash. Phosphoric acid is pounds potash. Phosphoric acid is worth 4 cents a pound, which is $2.37; potash in cottonseed is worth 5 cents a pound, equalling $1.90, or a total value of phosphoric acid and potash of $4.27 in a ton of cottonseed meal. This deducted from the cost of a ton leaves $30.73, which the nitrogen in the meal costs per ton. If there are 143 pounds nitrogen in a ton, then one pound costs 20.7 cents. Note that this is only 0.3 cent from the actual trade value placed by the Connecticut station in its late report.

Now figuring on protein is altogether different, since the value of protein, fat, carbohydrates, etc., depends so much upon their combination, palatability, etc. Books and leading experiment station reports, are without specific figures on value for a pound of fat, of carbohydrates, of protein.

However, the Myrick feeding chart suggests that fat may be worth 2 cents a pound, and carbohydrates 1 cent. Figuring on that basis, note that cottonseed meal runs 40 per cent protein, 20 per cent. carbohydrates, and 198 pounds fat. The carbohydrates would have a money value of $4, the fat $3.96, which gives a total value of $7.90 for carbohydrates and fat. This, deducted from the $35, cost of a ton of meal, leaves $27.10, the amount which the protein in the ton costs. If 800 pounds protein cost $27.10, one pound will cost 3.3 cents.

It is usually figured that the protein in a commodity is 6¼ times the nitrogen. There are abundant figures showing nitrogen is worth 21 cents a pound in cottonseed meal. Hence a pound of protein might be valued at 6¼ of 21, or in the vicinity of 3.3 cents, as it actually figures out above.—N. E. Homestead.

FELL FROM A HAY LOFT

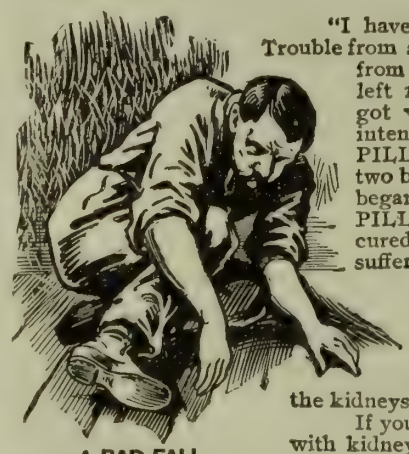
Suffered Tortures With His Kidneys Until He Tried Gin Pills

You might think that Mr. Baker needed a surgeon more than GIN PILLS. But there were no bones broken. His back was strained, which was harder to cure because nothing seemed to do any good. It is the same with a sprained ankle and broken leg. You can set the fracture and it will be well in six weeks—but the sprain may take months to get well.

However, Mr. Baker found the quick way to get relief from the pain—here are his own words.

AULTSVILLE, ONT.

"I have been a great sufferer from Kidney Trouble from an injury to my back caused by falling from a hay loft about six years ago. This left my kidneys weak, so that every cold I got would settle in my kidneys and cause intense suffering. I was advised to try GIN PILLS. I found, to my surprise, after taking two boxes, that the pains were relieved and I began to feel better. I am still taking GIN PILLS and feel sure I will be completely cured. I recommend GIN PILLS to all who suffer from any Kidney Trouble". C. BAKER.



A BAD FALL

You see, the fall had strained the kidneys and they were affected by the slightest chill. GIN PILLS immediately strengthened the kidneys—soothed any irritation and thus enabled the kidneys to overcome the effects of the fall.

If you are having pain in the back—or trouble with kidneys or bladder through accident or overwork—do just as Mr. Baker did—take GIN PILLS. They will help you—cure you—or we will promptly refund your money Buy six boxes at your dealer's. If, after taking them, you feel that Gin Pills have not helped you, return the empty boxes and get your money. We will take your word for it. 50c. a box, 6 for $2.50. Sample box sent free if you write National Drug and Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS regulate the bowels and cure Constipation, Biliousness and Indigestion. 25c. a box. 111

A Land Settlement Policy for New Brunswick

(Continued from page 459)

order named. The first is the most simple and by far the most economical. It is absolutely safe and in my judgment perfectly feasible. All it requires is a slight amendment of the Dominion Savings Bank Act whereby funds on deposit in any Province can be loaned to the Government of that Province for use in agricultural pursuits only. The Province could pay the Dominion Government say 3½ per cent. on all such loans, and it could again lend the money out, at say 5 per cent. Here would be a margin of 1½ per cent. upon which the Land Settlement Commission could count for a profit in its transactions. If your Provincial Government backed by the united voice of this Convention, took the matter up, I am convinced they could secure a satisfactory arrangement with the Dominion Government.

When I stumbled on this idea, a few years ago, I supposed it was original with me. But I was mistaken, for, on further study, I discovered that this identical proposal had been tried in Germany. It is curious to see how men in different parts of the world, in groping around for ideas, will stumble on the same scheme. In Germany, the Imperial Government has loaned the proceeds of State Insurance, not only to the State Governments of

HOW TO RAISE THE MONEY.

But how can the Province raise the necessary funds? This is the fundamental query of all. My answer is—she can raise it in one of three ways:

FIRST—At the present moment there is on deposit at Saint John in the Dominion Government Savings Bank, the sum of $5,000,000 derived from the savings of the people. The Finance Minister of the Dominion holds this fund as a part of the Consolidated Revenue of the nation, and allows depositors 3 per cent interest. It is largely an unproductive and inactive fund. I would use that fund on the credit of the Province, for agricultural loans. This would require an arrangement by which the Province could borrow annually from the fund the necessary amounts, securing the Federal Government by issue of Provincial bonds or other obligations at say 3½ per cent. on long terms. At the same time the Provincial Government should establish what, for want of a better term, I would call a Land Settlement Commission. The funds received from the savings account of the Dominion Government could then, through the Commission, be loaned out to farmers, fruit growers and other persons engaged in agricultural pursuits. The Commission would consist of three members who would form a body corporate, and manage the business side of the operations.

SECOND—Another method of obtaining the funds would be for the Province to issue its own debentures at, say, 4 per cent. for long terms, and from the proceeds of their sale, would turn over to the Land Settlement Commission such amounts annually as the Lieutenant Governor in Council would approve. The funds so received by the Commission would be lent out again as above described.

THIRD—A third method would be for the Land Settlement Commission itself to issue bonds upon the guarantee of the Province, for such amounts and terms as the Government might approve. The funds so received would be used by the Commission in exactly the same manner.

The methods described appear to me desirable in the the Empire, but also to municipalities and associations engaged in erecting cottages for working men. It has been successful beyond all anticipations. In this very year the same thing has been recommended by the Massachusetts Legislature, whereby certain moneys of Savings Banks deposited with the State Treasurer, may be loaned to the Commission for the erection of working men's cottages. This is the first experiment in the United States. But, as I shall show a little later, the same thing has been tried in the Australian States. There, however, each state has power to grant charters to Savings Banks and the savings of the people are used by an Agricultural Bank for the purposes I have described. In Canada the Federal Government alone can grant a charter to any Bank, and that is the fundamental reason why I have suggested the establishment of a Land Settlement Commission, by which the Province could launch the scheme. But the principle at bottom is the same in both countries, viz: that the savings of the people should be used by the Government of the Province for agricultural development. There a state can do it directly, here it must be done indirectly, by arrangement with the Federal Government.

By the Second and Third methods, the Province could raise the money, but not so economically. You would probably have to pay 4 per cent. on long term debentures and the price of their flotation would be apt to bring up the rate to 4½ per cent. on the money realized. The margin between 4½ per cent. and 5 per cent. would be small, and the chances of profit on the loan operations of the Commission would be reduced. Under these methods it might be necessary to raise the rate on loans from 5 to 5½ per cent. or 6 per cent. But even then capital would be supplied on very cheap and easy terms.

DETAILS OF THE PLAN.

Our Land Settlement Commission or some similar body having been set up and received the funds, would commence operations. Loans would be made say from $100 up to $3000 for agricultural purposes only, at periods say from twenty-five to thirty years. I would prefer the latter period, and commence to collect your first payment at the end of six months. They should manage the business side of the operations and give to the project their entire attention. All political functions would be reserved to the Government, and the two functions must be kept absolutely apart. The loans would be so arranged that a borrower would pay a fixed sum every half year and no less. Part of this amount would consist of interest at 5 per cent. (or whatever rate is established) and part in reduction of principal. As the loan continued, the amount of principal upon which interest is calculated would be reduced by the partial payments every six months, and at the end of the period would be extinguished. For example, if John Smith should borrow $1000 he would have to pay a fixed sum of $32.35 every six months for thirty years, until his loan, with interest at 5 per cent., was fully liquidated. Or if Smith would prefer to pay an even sum of $10 every six months, he could borrow $309.08 and in this manner pay it off in thirty years, with the interest at 5 per cent. The scheme of loans is best illustrated in the Tables "C" and "D", annexed to my Address, and I would urge you to carefully study them when published. They were prepared by Mr. James Liddell in the Foreign Exchange Department of Lee, Higginson, & Co., Boston.

In all cases, loans would be made by separate vote of the Commission and upon approved value. Loans should not exceed 70 per cent. value of agricultural property, and the Commission should have the right to advance a smaller percentage if the character and location of the property required such action. All loans would be secured to the Province, through the Commission, by a first mortgage upon the property, with provisions of foreclosure and sale in case of default by the borrower on any instalment. Every applicant for a loan must state the purpose for which it is required, and if any loan is used contrary to the scope of law, the Commission could cancel it at once and resume the property. Every loan would be made only upon the written report of experienced valuers employed by the Commission, and a small fee would be charged for the valuation. If a borrower failed to pay on time a fine would be imposed before he was reinstated in good standing. Payments may be anticipated, but no credit on interest could be given until the date of half year ensuing. Whether any portion of a loan could be used to buy stock or farming implements is a different problem, but I should be inclined to permit a use of say 25 per cent. of the loan for such purposes. Primarily, the scheme contemplates that the loan must be used for purchase price, erection of buildings or other permanent improvements. If a borrower's farm was free from incumbrances, I would permit a loan for purchase of stock, etc. and take security on the farm itself. A certain amount of discretion must be given to the Commission on matters of this kind, providing the loan was well within the amount allowed on the land. The lands of the Province should be classified, and the terms of a loan would depend on the character and location of the property. Small loans, up to $500 should have a preference, and the aggregate amount granted to any one person on different properties should not exceed $5000. In all cases, no sale or transfer of the property should be

For Sale
Peerless Incubators

1—120 Egg Machine
1—200 " "

Purchased from the makers last Spring 1911—used last season only—good as new, will sell at a greatly reduced price.
My reason for selling is I have gone into retail milk business and require additional room by converting poultry house into cow shed.

WM, COWLING,
Moncton, N. B.

For Sale to Make Room.

Five (5) Trios S. C. Brown Leghorn, 3 Cockerel and 2 Pullets. $4.00 per Trio.
S. C. R. I. Red Cockerels and Pullets. $1.00 and $2.00 each. 5 R. C. R. I. Red Cockerels $2 each.
These must be sold to make room for Breeding Pens.

W. H. HENRY,
Shubenacadie, N. S.

Shorthorn Bulls for Sale.

We have ten Roan and Red Bulls from 10 to 14 months old, of splendid form and good dispositions. Would be glad to supply Societies or private individuals.

C. C. H. EATON,
Canard, N. S.

SEA VIEW STOCK FARM
Buctouche, N. S

Offers for prompt sale:—
1 Holstein bull 3 years old.
1 Holstein bull 14 months old.
2 Holstein bulls 5 months old.
1 Holstein Heifer 5 months old.
All from good milking strain and prize winning stock. Must be sold early to make room for new stock.

YORKSHIRE PIGS.

No Jerseys for sale at present. We have three litters of Yorkshire pigs, five weeks old for sale. Price five dollars, registered.

JOSSELYN & YOUNG, St. John, N. B.

EGGS FOR HATCHING.

Now is the time to look ahead and look spry. Eggs for hatching from Barred P. Rocks, White Rocks, R. C. Reds, Buff Orpingtons and Imperial Pekin Ducks $1.00 per setting, all orders booked ahead and shipped in rotation.

EGBERT DeYOUNG,
Box 120 Dartmouth, N. S.

Farm for Sale.

One of the best farms on Northumberland Strait, 140 acres, nearly 100 acres cleared, well watered, cuts about 25 to 40 tons of hay; lots of good pasture, good buildings, near two churches and schools. Rural mail delivery. For particulars and price write to J. H. FRASER R. R. No 2 Amherst P. O. N. S.

Eggs For Hatching.

More winners in our pens of B. P. Rocks, than in any others of this variety east of Montreal. We have been in competition with the best and more than held our own. Eggs are one quarter the price of imported stock and issue every time ahead. Inquiries as to prices solicited.

Craig Bros., Amherst, N. S.

HILLSIDE STOCK FARM.

Ayrshires of choicest strains, imported and home-bred. Won in 1911 first for herd at Chatham and Fredericton, also Male Championship at Halifax and Chatham, and female Championship at Fredericton. One Bull seventeen months old. FOR SALE.

PRESCOTT BLANCHARD, Prop.
Truro, N. S.

Orpingtons,
In Buff, Black and White.

At the Winter Fair in Amherst won 2nd Buff Cock, 1st pair Utility Pullets in the keenest kind of competition. In Whites 1st Cock, 1st hen. In Blacks, I made a clean sweep, winning also at Halifax, New Glasgow and Pictou. Stock and eggs for sale.

C. H. Wisener, Pictou, N. S.

permitted without consent of the Commission. The names and accounts of borrowers should not be open for public information. Officials should be prohibited from revealing secrets, just as banks are to-day.

All profits derived from the operations of the Commission should be paid over to the Provincial Secretary, and set aside by him as a fund for the redemption of bonds or other obligations of the Province incurred on the scheme. This fund would be conservatively invested by the Provincial Secretary, until such time as he could arrange for the redemption of obligations to the Federal Government or the public as the case might be.

READY MADE FARMS.

There is another branch of work which the Commission should do. It should be empowered to purchase abandoned farms or other lands, erect suitable farm buildings, thereon, construct necessary roads, and sell them out again to natives or immigrants. The purchaser would of course deposit at least 30 per cent. on the purchase price, and the balance would be taken back in mortgage by the Commission. This mortgage would be paid off in exactly the same way as a loan. To the actual cost of a farm plant, thus created, 10 per cent. should be added for sale. As an experiment but a limited number of these plants should be acquired, until they were sold off. Under this branch of its work, the Commission might allow prospective buyers a chance to work on the buildings, roads or improvements, and credit for the value of their labor could be given on the purchase price. This is an important feature of the work among immigrants, who are not accustomed to the ways of the country. When money is advanced for the erection of buildings, improvements, stock or implements, an account should be opened with a borrower and the loan placed to his credit. But the money should not be paid over until after inspection of buildings, etc. and then only upon instalments. This is necessary for the protection of the Province. Borrowers should also be required to keep their property in good repair, so long as the loan exists thereon. No member of the Commission, nor any official on its staff, should have any interest in lands upon which loans or improvements are made. Loans may be re-adjusted after ten years, and the account started as a fresh loan for the usual period. But it should not be treated as a fresh loan, unless the balance unpaid amounted to at least $300. Under this arrangement borrowers would be relieved of the interest on the original amount of the loan and will pay interest only on the balance of principal unpaid. This would materially lighten the charge.

AMOUNT OF FUNDS REQUIRED.

Another important question is, how much money will it take to start the experiment? I estimate that at least $150,000 per annum should be raised, and in a short time this amount must be augmented. Suppose the loans should average $500, as they probably would, then your capital would be barely sufficient to assist 300 heads of families or 1500 people in all. You must deduct at least $10,000 per annum for operating expenses during the first few years until the repayments back from loans gave the Commission a chance to turn over its funds. In fact the amount of funds allocated to the Commission should be much larger, if you expect to accomplish anything worth while. It is necessary to take this thing up in a bold and courageous spirit.

FRAMEWORK OF LEGISLATION.

It also appears to me that any law enacted by the Legislature to carry out this project should be in two parts. The first part would establish the scheme of advances to Settlers, etc. through a Land Settlement Commission which I have already described. The first operations must be handled in this way, and the details would be supervised by such a Commission. But a second part of the Act should provide that as soon as a charter for an Agricultural Bank was granted to any body of men whose standing was approved by the Provincial Government, the whole system of State advances would be turned over to such a Bank. The Bank should assume all the obligations of the Commission, carry on the details, and the Province would withdraw from the scheme as soon as practicable. Until such time as the liabilities of the Province were discharged, the Government should have a proper representation in the control of the Bank. My view is that an Agricultural Bank is the ultimate goal of this policy. It could then take in the Savings of the people, and raise the necessary funds for advancement to settlers, etc. just as it is done in other countries, and no further government assistance would probably be necessary. But until the Dominion Government was convinced by actual experience that the operations of such a system were successful, I doubt if a charter for an Agricultural Bank could be obtained. In the meantime, it is for the Province through a Land Settlement Commission to inaugurate the policy. Whether this is carried out by a Commission or by an Agricultural Bank, its operations should be conducted in harmony with the Provincial Department of Agriculture. The two branches should cooperate but all political functions, whether in treatment of immigrants or otherwise, should be reserved to the Government. The Commission or the Agricultural Bank should be purely a business institution, to advise, if need be, but resting securely upon the solid basis of property and finance. It cannot be stated too strongly that the success of this project depends mainly upon the application of business principles, and all parties in the Province should unite to give it a fair trial.

ARGUMENTS FOR THE PLAN,

I have endeavored to place before you the conditions of agricultural life in this Province. A remedy has been suggested. I do not pretend that it will remove all difficulties or take the place of energy, ambition and thrift. Nothing will do this. But it is a remedy which, if fully applied over a period of years, will, in my judgment, be a great boon. I claim that something of this kind is absolutely necessary to retain a fair percentage of our native increase in population. This is just as important as procuring immigrants. A young man born on the land in New Brunswick is the best possible citizen for this country. He knows the customs of the people and he understands the conditions of farming much better than any immigrant, however intelligent. The first ambition of a government should be to retain that citizen in the country. It cannot be done without some capital supplied at the critical moment of his career. Let us suppose the case of a farmer who has several sons growing up to manhood. They occupy, we will say, 200 acres of land. It is impossible for all those boys to marry and find a career on their father's farm. Some of them must go elsewhere. In normal cases their capital is small but their ambition is high and their health good. Those boys are the finest asset a nation can possess, and it is just here that the remedy I propose would give relief. Such young men should obtain capital, be encouraged to buy other farms, erect buildings and settle down as citizens. Instead of going to the States or elsewhere to earn money for the purchase of a farm, they should get it here, on the credit of the nation. They should get it, too, on liberal terms, so they would not be burdened with exorbitant rates of interest for half their life. I believe if it were once known that such means were open to our young men, a new spirit would come over the country and the days of pessimism would rapidly recede. You cannot make the wheels go round without capital. How many instances have we seen where young farmers have bought land, but possessed no funds for the erection of a house or barn. If you gave them the capital at the right moment, their careers would be a success. Without it they frequently toil on in debt, and ultimately give up the struggle. The result is another abandoned farm added to the dreary total I have already named. I say, therefore, my proposal is adapted to the wants of the natives whose welfare is of first importance. Then again you must have something to offer the immigrant. The Eastern Provinces cannot, in my judgment, hope to compete with the free homestead (160 acres) of the West, unless they wake up and display some goods. Many of these immigrants possess all the way from $500 to $2000, and it is not human or natural for them to buy a farm here, when they can get one in the West for little or nothing. Here is where our Ready Made Farm should come in. The Land Settlement Commission should have on hand a small number of farms, with suitable buildings for occupancy. The newcomer is not familiar with the cost of construction here, and a ready made home would be a big attraction to him. Especially would it be so, when he could deposit say 30 per cent. of purchase price and borrow the balance from tne Commission on easy terms. No better advertising scheme could be invented.

As soon as the first plants were sold, the demand for others would be certain to increase. You would get

WAS TROUBLED WITH HEART DISEASE AND NERVOUSNESS

SEVERAL DOCTORS COULD DO HER NO GOOD. THREE BOXES OF MILBURN'S HEART AND NERVE PILLS COMPLETELY CURED HER.

Miss Mary Lebeau, Edison, Sask., writes:—"I was troubled with heart disease and nervousness for over two years, and was so bad at times I had to sit up at night being unable to breathe, and every little noise would make me shake and shiver. I tried several doctors, but they were unable to do me any good. A neighbor then advised me to try a box of Milburn's Heart and Nerve Pills. As soon as I began to take them I began to feel much better, and by the time I had used the third box I was completely cured. I would advise anybody suffering from heart disease and nervousness to try these pills. They will save quite a bill in doctor's fees."

Milburn's Heart and Nerve Pills cure all heart and nerve troubles by their restorative influence on every organ and tissue of the body.

Price 50 cents per box, or 3 boxes for $1.25 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MODERN SANITATION POSSIBLE ON THE FARM OR IN THE VILLAGE

The Good Health Sanitary Chemical Closet is a modern Sanitary Convenience constructed particularly for families who live in a district where it is impossible to have waterworks or sewerage; a sanitary closet that can be placed in your home, store, school, hotel or public buildings; a closet that is made right by overcoming each and every objectional feature found in other so-called "Sanitary Closets." There is no burning to do. The "Good Health" Closet is 17 inches high; 17 inches wide; 24 inches long. It is manufactured from best English Sheet Steel, polished brass and nickle plated fittings; all wooden parts being hard birch highly polished with mahogany finish. Costs from $1.00 to $2.00 per year for maintenance and from 50c to $1.00 to install according to range of pipe. Write for "Good Health" Book and further particulars.

Advice to Ladies.

I was sick with Heart trouble and constant headache due to change of life. I called a doctor but failed to improve. I was told to use

GATES' LIFE OF MAN BITTERS AND SYRUP

and they are wonderful with me. It was after the use of the first few bottles my final recovery began, I thank you for the remedies, a few dozen bottles is small in cost compared with physicians bills.

Gratefully yours,
MRS. JOHN FOLEY,
Cornhill, N. B.

your immigrants and under the guidance of the government, I believe they would stay. If such a thing can be done by the Canadian Pacific Railway in the West, why cannot a Land Settlement Commission or Agricultural Bank do it in New Brunswick? Are you going to admit that the constructive genius of your people has deteriorated? I, for one, will never make any such confession. Let the sons and daughters of old England, Scotland, and Ireland come, and we will provide them with an opportunity for life and hope upon the vacant lands of our Province. I know that some of our natives have objections to these immigrants. But please remember that it is only a few years since our forefathers were immigrants. Do not let us be too harsh. If the first generation is not a success, their children may be. The people of Anglo-Saxon stock are wanted here. Let us not repeat the blunders of the neighboring Republic in this respect. If any of you want a lesson in racial stocks, I would urge you to visit cities such as Lawrence and Lowell in New England, and see what kind of people now inhabit these places, once founded and governed by men of Puritan lineage. Look again at the polyglot races of Boston, New York and Chicago. The conception of large classes in these cities is utterly alien to our institutions and government. I say, therefore, you need the men of British blood and exiled Canadians too. You want settlers whose traditions are yours, whose aspirations are yours, and whose instincts are one and the same. And if you want such people, you must enter the competition for their families by offering them something tangible. You must in short make it easier for such people to acquire homes and possess the land with you.

Another question which should be fairly considered is this. Will the project pay or will the Province lose money on it? At the beginning it probably will not yield a profit, but after a period of a few years I am confident it will. The funds can be raised so there should be a margin of at least 1 per cent. between the interest paid by the Government and the rate received from loans. If the Savings deposits of the Dominion Government can be used the margin should be greater. The same margin would also prevail under an Agricultural Bank. In this connection I may point out that the average margin between the yield from investments and interest on deposits in the Savings Bank of Massachusetts, is not over 1 per cent. In that Commonwealth there may be found the most successful system of Savings and Co-operative Banks of the world. Their affairs are supervised by a State Bank Commissioner, and failures are almost unknown, except by defalcation or robbery. Even these cases are rare. But supposing the project does not pay at once, is it not worth while for the Province to bear for a few years the running expenses of an institution that is calculated to yield enormous benefits to her people? While we are discussing the question of profit, let me ask you this. What profit have you received from the millions of dollars in Railway subsidies appropriated in past years? What profit does your government derive from the annual sums granted for great public works? None, absolutely none, except in the general welfare of the people. Indirect benefits no doubt are many and legitimate. But I contend that if you consider this project entirely on the basis of profit, you have not grasped its purpose. If subsidies are good for railways, I hold that a moderate expense for the settlement of human beings in your country is still better. If public works are necessary, so are people to replenish your land and revive a drooping industry. Neither railways, public works, nor any other institution are of any value unless you have a prosperous people to support them.

EXPERIENCES OF OTHER COUNTRIES.

Fortunately, in this matter, my arguments do not rest wholly upon theory. They are based also upon the experiences of other nations in different parts of the world. Let us, therefore, for a moment, consider some of these experiences and their results.

I have already referred to Germany, where the credit of the nation has been used to much greater extent, than is necessary for our project. In addition to the loans of the Imperial Government, the cities and towns of Germany have for many years advanced money to societies and individuals for the construction of working men's dwellings. In 1900 the city of Dusseldorf established a Department to loan money on land and borrowed over $4,000,000 at 4 per cent. to promote the building of dwelling houses. At the same time it instituted a Land Purchase Department, with the loan of $1,250,000 as working capital and proceeded to buy houses directly. In the following year more than 300 applications were received for 140 dwelling houses that had been completed. Dr. Suedekum, a member of the Reichstag, is authority for the statement that out of $238,000,000 received from the working men's insurance over $156,000,000 are loaned out on working men's homes. These efforts to provide healthful homes for workers have been a considerable factor in the reduction of the death rate in Germany from 29 per M in 1871 to 19 per M in 1908.

In France a law was passed in 1910 providing for the acquisition and development of small rural properties through long term individual loans.

Little Denmark has also adopted a law to encourage the acquisition of small rural holdings, and the result has been the creation of a large number of prosperous farmers. By her system of small holdings and co-operation, she has actually changed the current of migration from the cities back to the country, and about 5-6 of her property is owned by small freeholders. Many co-operative societies have been organized for the collection, sale and exportation of produce.

In Brazil the Government authorizes the Savings Deposits in the Banks, to be loaned directly to building companies for the erection of workmen's homes. The houses must be constructed according to Government plans, and they are sold out again to tenants on long terms of credit. This is very generous. But I only advocate this loan of such Savings Banks Deposits on the credit of a Province. If it is safe in Brazil to lend such funds to private companies, why is it not perfectly safe here to lend them to a Provincial Government? To state the question is to answer it.

Turning to England, our mother country, we find many acts of legislation authorizing the borrowing of money on the public credit, for the erection of dwellings among the laboring classes. Power has been given freely to acquire land either by agreement or compulsion, and to loan money to associations and individuals for the erection of dwellings. For such purposes even municipalities have been authorized to borrow from the government or in the open market. Most of this work, of course, has been done in the slum districts of the great cities, but the operations, as a rule, have been conducted with profit and satisfaction. In many instances the action of the government has stimulated private enterprise. Under the Small Holdings Act of 1908, farmers have received over 167,000 acres. The allotment is intended to supplement the earnings of the agricultural laborer or the town artisan, and in June, 1911, there had been organized not less than 162 Small Holdings Societies. The London County Council has recently acquired some 225 acres of land and proposes to erect over 5000 cottages which will house some 42,000 people. While the housing problem in Great Britain has not yet been solved, as a result of these systematic efforts by the State and municipalities a remarkable decrease in crime, disease, and death has followed.

But the best illustration for our purpose may be found in Ireland. There the British Government has not only advanced money to tenants for the purpose of acquiring their farms, in fee simple, but it has also advanced money for the erection of cottages in the country districts. The advances have been made through a Land Commission, very much as I have suggested should be done in New Brunswick, and in many instances the loans are repaid by annual instalments extending over a period of 49 years. That is much more radical than anything which I would suggest. As a result of this policy in Ireland the number of tenant purchasers in 1911 was 198,000 representing advances made to the enormous sum of $331,000,000 and covering an area of 6,000,000 acres. Even the rural councils in Ireland are permitted to obtain advances from the Land Commission out of the Land Purchase funds, and already by one form or another of government credit not less than 34,000 cottages have been constructed in the country districts of Ireland. At the present time over 5000 more are under construction. For the erection of such buildings the enormous sum of $25,000,000 has been sanctioned. There the Government has not sold the cottages, but has rented them at a very small cost, and an agricultural laborer can rent a fairly good house with an acre of land, for $.26 a week. So

far as I am aware, the peasants of Ireland have universally kept up their payments to the Government, and very soon the greater portion of the farmers in Ireland will be the absolute owners of their land in fee simple. The effect upon the country has been extremely encouraging, and Ireland to-day is enjoying a prosperity which she has never known in all her history.

But the experiments to which I call your most careful attention, are those which have been conducted in the great British Dominions of Australia and New Zealand. Notwithstanding the natural wealth of those countries, it has been found necessary and desirable for the governments to adopt a policy similar to one which we are discussing here. Six of the seven Australian Colonies have adopted in some form or other the principle of Government advances in order to settle the people upon the land. In 1893 the State of Victoria passed a law providing for advances to settlers to make improvements or to pay off old debts. The money was obtained from the Government Savings Bank at 3 per cent. and was loaned at 4½ per cent. over long periods. There the borrower paid 4½ per cent. on his interest and 1½ per cent. on the principal annually until the loan was extinguished, and the total advances which have been made amount to $5,600,000. The scheme has been successful and no serious loss has been incurred.

In 1894 Western Australia adopted a similar law, authorizing loans to settlers at 5 per cent. for improvement purposes only. Borrowers had thirty years in which to repay the loan in fifty semi-annual instalments, beginning five years after the date of the advance. This is a very liberal extension of credit, and goes farther than I would recommend. For the capital raised the government paid 4 per cent and the funds are turned over to an Agricultural Bank which operates the system. There is barely a margin of 1 per cent. between the cost on the money raised and the interest received on loans, but notwithstanding this fact the profits of the Bank's transactions for the year 1910 amounted to $34,000. That State has a population of only 281,000, considerably less than this Province. Since the Bank was established in 1894 it has advanced to settlers the enormous sum of $6,250,000. During the year 1910 the Bank advanced to borrowers $1,250,000 and in the same year the repayments to the Government amounted to $750,000. Through the instrumentality of this Bank and government credit not less than 600,000 acres of land have been cleared, 213,000 acres cultivated, and improvements of one kind or another have been effected at a cost of over $7,000,000. A reserve fund has been established for the redemption of the bonds issued by the State, and altogether the operations of this Bank are to my mind a complete answer to any objections that may be urged against a similar experiment in New Brunswick. If that State, with a population of less than 300,000 can carry out such a project successfully, for a period of seventeen years, why cannot the same thing be done here in New Brunswick? Annexed to my Address you will find, in table "E" the details of its operation.

Last of all, I should like to cite to you the achievements of New Zealand, the most wonderful little commonwealth that now exists. Many years ago the conditions in New Zealand were much the same as those now prevailing in New Brunswick. Cities and towns were filled with the unemployed, the congestion was producing slums, and vast areas of the land in the country lay idle. In 1894 a law was enacted providing for advances to settlers, and on terms varying from 20 to 36½ years. The system is operated directly under State control, and in this respect it differs from the plan in some of the Australian States. The chief officer is known as the Superintendent, who is advised by the Board. Altogether, for the purpose of this law, some $75,000,000 have been raised on the credit of the State. The funds have been raised at 4 per cent. and are loaned to borrowers at 5 per cent. plus the payment on the principal every half year, which brings the charge up to about 6½ per cent. per annum on the menoy lent. A sinking fund is created by the annual contribution of 1 per cent. on the total capital liability at the time of payment, and the fund is held by a Public Trustee for the redemption of bonds. New Zealand has also adopted a policy of erecting working men's homes, but this is altogether distinct from the law relating to advances for settlers upon the land. It is interesting to observe the operations of the New Zealand system during the past 17 years. Annexed to my address you will find in table "F" the actual results, but I would like to call your attention to the fact that advances of funds have been made to some 25,000 applicants aggregating about $45,000,000. These advances have been made upon first mortgages and generally upon freehold property. During the year 1909-10 the total advances amounted to $5,000,000 and the net profits on the transactions for the year amounted to $200,000. If New Zealand with a population of one million can advance $5,000,000 in one year and make a profit of over $200,000, are you going to shrink from pledging the credit of this Province to the small extent I have named? Five millions for New Zealand would be equivalent to $1,750,000 for New Brunswick. The sum that I have named for a beginning, viz., $150,000 is less than 1-10th the proportion of burden which New Zealand assumes. Conceding for the moment that New Zealand may be endowed with great natural resources, I cannot believe that there is such a vast difference between the ability of the two peoples to bear a public burden.

I know there are some persons who will say that the people of that Dominion are given over to wild and strange theories of government. They would class such legislation as Socialistic. But let us not jump at conclusions too quickly. I am aware that there may be some radical features of government policy in New Zealand, but after all due allowance for just criticism, the policy of any people must be judged by its results. To my mind there is nothing Socialistic whatever about this project, and I am convinced that if it can be made a success in Germany, Brazil, England, Ireland, Australia and New Zealand it can certainly be made a success in New Brunswick. The people of New Zealand and of this Province are essentially the same stock, and under normal conditions what our race can accomplish in one part of the globe it can usually accomplish in another.

CONCLUSION.

A few words more and I have done. Whether I have made out a case it is for you to say. I am not without hope, however, that this day will mark the beginning of a new era in the affairs of this Province. Upon your action much will depend. I have not discussed other proposals which have been made for the re-adjustment of our affairs. I have confined myself to a single great and supreme remedy. Other things such as Agricultural Schools, Experiment Stations, better roads, and probably an Agricultural College will accompany this forward movement. My remedy is not designed to build up cities or towns primarily, but to restore country life and agricultural pursuits to their proper place in the economy of a nation. If that restoration occurs, the cities and towns will receive adequate benefits. It is absolutely necessary for the people to recognize that the cultivation of the soil is the most important occupation in this country. Let us preach this doctrine from the house top, in every office, in every home, and upon every field, until our enthusiasm becomes so contagious that no government who cares for the welfare of its people will longer resist your demands.

Many years ago the late Thomas B. Reed, Speaker of the American House of Representatives, enunciated the pregnant truth that "man derives his greatest powers from his associations with other men, his union with his fellows." You and I, individually, can accomplish little. By our united efforts and enthusiasm we can achieve notable results. That is true of the project which we are considering. No individual, or group of individuals, can bring about the desired result, but the united efforts of the Province and people are sufficient to make this fair land rejoice and blossom as the rose. This country is not played out. Its resources are barely scratched, and its soil is only waiting for scientific treatment to respond to the necessities of man. In the mother country, beyond the seas, her hills and valleys have been cropped for a thousand years, and to-day their production to the acre is greater than any lands of the Western world. We have just as fertile lands, we have fairer skies, more beautiful rivers, and a variety of scenery which surpasses even the grandeur of the old world. What we require is a greater number of energetic and hopeful citizens, winning their triumphs from the soil and properly assisted with the living water of capital by the efforts of the State. I should like to see New Brunswick as the pioneer of this remarkable achievement. For it is certain as the rising of to-morrow's sun that something of this nature

This Washer Must Pay For Itself.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse. But I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't all right"

Well, I didn't like that. I was afraid the horse wasn't "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse although I wanted it badly. Now this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me.

So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

You see I sell my Washing Machines by mail. I have sold over half a million that way.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that, without wearing out the clothes.

Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges nor break buttons the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first and I'll make good the offer every time.

Let me send you a "1900 Gravity Washer on a Month's free trial. I will pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it?

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months, in wear and tear on the clothes alone. And then it will save 50 cents to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day and let me send you a book about the "1900 Gravity" Washer that washes clothes in 6 minutes.

Address me personally—**B. I. Bach, Manager, 1900 Washer Co., 357 1-2 Yonge St., Toronto.**

Have City Conveniences

REPLACE the pestilent, dranghty, dangerous and offensive out-of-doors closet with an indoors closet which requires no sewer, no plumbing, and no finshing system. Have city conveniences in your home. Safeguard family healih by installing a

"Tweed" Closet

Sanitary and Odorless

"Tweed" Closets can be installed in the bathroom, cellar, or any other convenient place indoors, merely requiring to be connected by a pipe for ventilation with a chimney hole. "Tweed" Liquid Chemical, used in connection with Tweed Closets is both a deodorant and a disinfectant. Many hundreds of Tweed Closets have been sold in Canada. Send for illustrated price list.

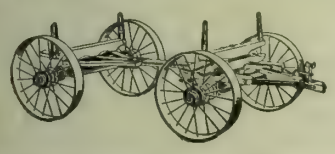
Put T-A Wheels on Your Wagons

These Wide-Tire Steel Wheels are so constructed that they roll smoothly over the roughest roads, without tiring your horses. And they are absolutely accident-proof—yet cheaper than ordinary, wooden wheels.

T-A Wide-Tire Steel Wheels and Handy Farm Wagons

Our Handy Farm Wagons are built low—making them easy to load and unload—and are especially designed to meet the requirements of the man who wants a light, strong wagon for all kinds of work on the farm.

Let us send you our catalogue. It will give you complete information.



Tudhope-Anderson Co., Ltd., Orillia, Ont.

It's A Pleasure To Do The Churning

with Maxwell's "Favourite". The roller bearings—and easy Foot and Lever Drive enable you to bring the butter without an effort.

Maxwell's is the finest butter maker in the world—and the best made, the strongest, the most satisfactory churn on the market. The proof is in the fact that more of these churns are sold in Canada than all other kinds combined.

Ask your dealer or write for catalogue.

MAXWELL'S FAVORITE CHURN

must be done. Already Ontario has taken some steps in this direction, but it is for you men of New Brunswick to solve the problem by a clear, intelligent and feasible method.

Let us turn our backs upon the dreary past of pessimism and despair, and look to the morning dawn of the East. Other countries may excel us in art and refinement, they may surpass us in commerce and manufactures. But most of them are cursed with the slums of great cities, with too much riches and too much poverty. Never before has there been so much bitterness between the classes, never before has there been so much unrest, among the masses. I turn from this sickening spectacle to find rest. As my eyes close upon such a topsy-turvy struggle for contentment, I wonder if in this Province we may find relief. I should like to see a country with few millionaires and still fewer paupers. I should like to see a land where there were no huge cities and no empty country. Give me a land filled with human beings, living under normal conditions for fresh air, sunshine and clear skies, and deriving their sustenance mainly from cultivation of the soil, and I will show you a country where there are neither riches nor poverty, strikes nor slums. I will show you the finest example of economic contentment which our civilization can produce. I will show you men and women, modest and serene, humanized by contact with the soil, strong in physical and moral fibre, and fit to become the chosen breed of any race.

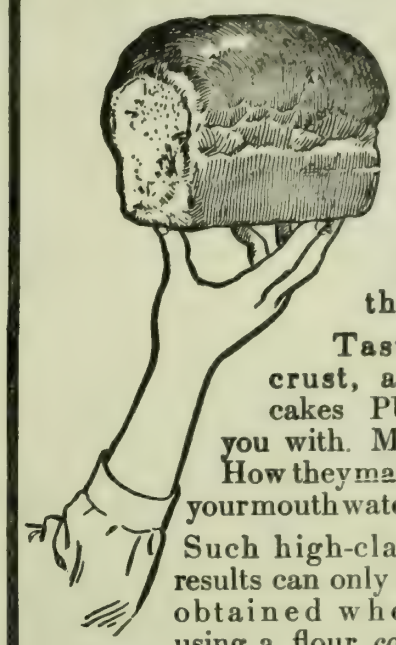
"Gray countries and grim empires pass away
And all the pomp and glory of citied towers
Goes down to dust; and Youth itself shall age.
But oh, the splendor of this Autumn dawn,
This passes not away!
This infinite great width of open space,
This virginal vast dome of open air,
These, these endure."

I have a pride in the traditions of this Province. Every phase of her history appeals to me. Her capacious forests first welcomed the log-cabin of my forefathers. Upon her lakes and streams they first met success in life, and transmitted to me an example of thrift and contentment which I revere. Their bones now lie buried beneath her soil, but the memory of their struggles is with me still. I cannot better state the philosophy of this movement, than by quoting to you the burning words uttered by James J. Hill, when discussing the future of the American Republic a few years ago.

"Now as ever, to the nation and race as to the individual, Nature, the unrelenting task-mistress of the centuries, holds out in one hand her horn of plenty and in the other her scourge. This country has brought itself within reach of the thong, while grasping at the satisfaction of present appetite and forgetting the primal relation between the earth and man. The pathway to prosperity is still open. The divinity of the earthly life at heart is kind. Under her rule there is work and abundant reward for all, but these must be won in her designated way and in none other. Her pointing finger that has never varied since man came upon the earth, shows the old and only way to safety and honor. Upon the readiness with which this is understood, the sober dignity with which a whole nation rises to the winning of its broad and permanent prosperity will depend the individual well-being of millions of this and many generations. Largely by this method will posterity, our fit and righteous judge, determine whether what

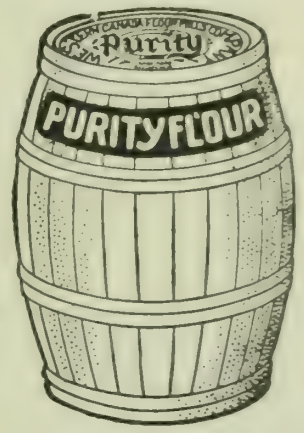
Be Fair. Buy a sack or barrel before judging PURITY FLOUR

SOME people have attempted to judge PURITY FLOUR before knowing the facts about it—before using it. So we ask you to be fair and to buy a sack or barrel of PURITY FLOUR and give it a thorough try-out before attempting to arrive at a judgment.



Look at the beauty and loftiness of the golden-crusted, snowy-crumbed loaves, fit for a king. Count them and see how many more of them PURITY yields to the barrel than ordinary flour does.

Taste the creamy, flaky pie crust, and the deliciously light cakes PURITY FLOUR rewards you with. My! How they make your mouth water!



Such high-class results can only be obtained when using a flour *consisting exclusively* of the *high-grade portions* of the *best Western hard wheat berries*.

And remember, that, on account of its *extra* strength and *extra* quality, PURITY FLOUR requires *more* water when making bread and *more* shortening when making pastry, than you are accustomed to use with ordinary flour.

PURITY FLOUR

"More bread and better bread"

Buy a bag or barrel of PURITY FLOUR. Test it for a week. Then pass judgment.

Add PURITY FLOUR to the grocery list right now.

Net Profiton operations 1909-10.		$210 000.

Run the Disc Before the Plow.

The use of the disk is becoming more and more common before plowing. Many of the best farmers double disk the land as soon as it is dry enough in the spring to make the surface fine. This disking not only insures that the bottom of the plow furrow will be fine, but also cuts up and mixes with the soil any plant refuse or manure that is to be plowed under. At first this appears to be a lot of work in addition to that ordinarily expended on the preparation of the seed bed, but those who have tried this disking before plowing, most thoroughly, are its strongest advocates.

I have seen cases where heavy growths of cornstalks have been taken care of by this means in such a way as to be placed out of the way of the cultivator shovels, and so well mixed with the soil at the bottom of the plow furrow as to cause no obstruction to the rise of water from below.

An Object of Pity.

That part of our nature which we call the emotional is much more highly developed in women than in men. They are more sensitive, more tender, more sympathetic, more pronounced in their likes and dislikes, more susceptible to the extremes of pleasure and pain; and these refined mental qualities, no less than beauty of form and feature, make up the atmosphere of attractiveness and charm which always surrounds true womanliness.

The continued existence of these winning, engaging womanly characteristics depends to a very large extent on the regularity of the womanly functions and the condition of the womanly organs; and when these functions and organs become disordered or diseased the same mental qualities which are the glory of a well woman become the source of suffering and torture almost indescribable. Her cheery hopefulness is changed to a feeling of despondency, almost of despair, and she is haunted with forebodings of worse evils to come. Instead of being entertaining and companionable, she becomes moody and irritable, being unable to keep her mind from dwelling on her troubles. She becomes morbidly sensitive, imagining that she is being slighted or foresaken by her relatives and friends and she has a most humiliating sense of her miserable condition and of her loss of her womanly attributes. If she is religiously inclined she is very liable to be oppressed with doubts and fears in regard to her spiritual condition, or to think that she is eternally lost. In addition to this, she has also to endure the most distressing aches and pains.

What makes the case still more pitiable, especially with married women, is the fact that few men understand or appreciate the extent of their suffering, or the seriousness of the troubles causing it. Many doctors even speak of these disorders as subjects for ridicule, and the poor sufferer often gets a reputation for being a crank or a scold when she more nearly approaches being a martyr.

As these disorders are due to a disordered condition of the womanly organs, it is evident that to effect a cure these organs must be restored to normal condition; or, in other words, the circulation, which has become congested and stagnant in these parts, must be improved so that the waste matter will be expelled, and the nourishment so badly needed be brought to these suffering organs. It is the waste matter, or broken down tissue, which is held in the stagnant blood vessels in these parts, that causes most of the suffering by oppressing the nerves located in these parts.

The remedy known as ORANGE LILY will positively relieve this congestion and restore normal circulation in the disordered organs. It is an applied or local treatment, and acts wholly on these parts. It is absorbed into the blood vessels in these organs, and as it has powerful antiseptic properties, it immediately acts on the waste matter held there, and causes it to be discharged. As this dead matter is discharged the nerves are relieved, the pains and mental troubles become less, and the nerves and blood vessels become stronger. ORANGE LILY thus proves its merit by actual, visible results. It acts as certainly and as positively on all female troubles as anti-toxin does on diphtheria.

Winnipeg, April 28th, 19—

Dear Mrs. Currah,—I am very grateful to ORANGE LILY for the change it has made in my life. When I commenced its use eight months ago I felt I would be surely insane before the year was ended. The pain I suffered often made me wish for death, and besides I would have such fits of depression and nervous twitching that I would have to scream. I had doctored with three different doctors for over two years, and had also used both the Pierce and Pinkham medicines, but none of them seemed to reach my case. I felt some improvement after the first month's use of ORANGE LILY and have kept gaining ever since. I do not feel that I am entirely cured yet, but I am so much better than I was that I am sure I will soon be entirely well. I sleep well, and feel cheerful and happy, except that I am occasionally somewhat depressed, but these spells are getting fewer and milder. I have also noticeably improved in appearance. Enclosed find $2 for which please send me two boxes of ORANGE LILY and one of Cerate Massage. I might add that the matter which used to be freely discharged, and which looked like a chicken's gizzard, is becoming very scant, and I imagine that the circulation is pretty well restored. Am I not right in this? Your sincere friend. MRS. L. E. A.

Free to all Sufferers

In order to enable every woman suffering from any form of female disorders to test the merits of ORANGE LILY, I will send to everyone who will send me her address, or the address of any suffering friend enough of the remedy for ten days' treatment, absolutely free. As this is worth 35c. it is only because I know that it must give relief that I make this free trial offer. Further, if any woman wishes expert medical advice, and will write me a full description of her case, I will submit same to the staff of the Coonley Medical Institute, Detroit, Mich. and they will write her direct without expense to her. INCLOSE THREE 2-CENT STAMPS and address MRS. FRANCES E. CURRAH, WINDSOR, ONT. 2

Well, Well!

THIS is a HOME DYE that ANYONE can use

I dyed ALL these DIFFERENT KINDS of Goods with the SAME Dye.

I used

DY-O-LA

ONE DYE FOR ALL KINDS OF GOODS

CLEAN and SIMPLE to Use.

NO chance of using the WRONG Dye for the Goods one has to color. All colors from your Druggist or Dealer. FREE Color Card and STORY Booklet 10. The Johnson-Richardson Co., Limited, Montreal.

Small Fruits.

Strawberries.—I have the following varieties that have been widely successful. Extra early, Michel's Early, Excelsior, Bederwood; Early, Dunlap, 3 W's., Glen Mary; Midseason, William Belt, Parsons Beauty; Late, Sample, Buster, Uncle Jim, Stevens; Extra Late, Nettie and many others, $1.00 per hundred mail postpaid. And three varieties of recent introduction which I believe have come to stay; Gill, an extra early and Fendall and Golden Gate, midseason, $1.25 per hundred, mail postpaid.

Raspberries.—I have a fine stock of plants of Herbert and King, the two best hardy commercial varieties; Eaton and Brighton, two promising new ones and Marlboro and London, two old ones. All hardy. 1 dozen of any of the above 75 cents, mail postpaid. Send for catalogue and prices for quantities.

P. P. NEWMAN, Box 51, Lachine Locks, Que.

Strawberry Plants

Glen Mary, Sample, Williams, Three W's, President, Buster, Springdale Beauty, Stevens Late Champion and others. Prices, 25 plants 50c, 100 plants $1.00, postpaid. With every order for 100 strawberry plants or over we will send free of charge, 1-2doz. "Hiram" Raspberry plants for trial.

Raspberry Plants

Hiram.—A fine large berry of choice quality, 50c per doz. post paid, $1.50 per 100 by express. Herbert.—Very hardy and heavy yielder. 75c per doz. postpaid. Owing to large future orders and increasing our own acreage we will not be able to supply "Herbert" in 100 lots this spring.

Orchard Hill Farm, Brown's Flats, N.B.

KINNEAR POULTRY CO. LTD.,

Sussex N. B.

We are now prepared to supply eggs for hatching from our Utility Pens of B. P. Rocks & R. I. Reds (bred for egg production and market qualities) at $4.00 per 100 in lots of 50 eggs or more. Order ahead of time to ensure delivery when wanted.

STRAWBERRY PLANTS

All the latest, best producing varieties including: Senator Dunlap, Williams, William Belt, Brandywine and numerous others. Send for Catalogue.

JOHN H. CHUTE,
Berwick, N. S.

Aid to Thoroughbred Stallions.

The policy initiated in 1911 by the Department of Agriculture with reference to the granting of aid, under certain conditions, to the owners of Thoroughbred stallions is generally meeting with approval and is accomplishing, in part at least, the objects sought when the policy was undertaken. Amongst other things, owing to the rigid conditions imposed, it is encouraging those maintaining really high class horses and is serving to organize the system of breeding followed in the different communities where Thoroughbred stallions are located. The stimulus given, in this manner, to the use of Thoroughbred blood will, it is believed, lead to an improvement in the light horse stock of the country. Thoroughbred stallions, if really good individuals, may be expected to exert such an influence in the development of Canadian horses for saddle and harness use, as is greatly needed and greatly to be desired. The premium placed upon quality, soundness and prepotency, through the grants awarded by the Department is serving to check the use of unsuitable sires and is tending to conserve a type of Thoroughbred, the utility of which is beyond question.

While, as perhaps should be stated, it is not the intention of the Department to encourage the breeding of Thoroughbred horses or to develop a type in light horses approximating closely to that of the Thoroughbred, there is no question but that a strong infusion of Thoroughbred blood in the light legged mares of the country will be of inestimable value in improving the quality of the stock got from them by stallions of the various light harness breeds.

Believing himself to be justified, therefore, in further prosecuting the policy begun last year, the Honourable Martin Burrell, Minister of Agriculture, has authorized the continuance of the grant, to be available for all Thoroughbred stallions, standing for public service during the season of 1912, which comply with the conditions imposed by the Department.

The conditions under which assistance will be given are as follows:—

(1) All horses on account of which aid is given by the Department must be registered in the Thoroughbred Stud Book of the Canadian National Live Stock Records.

(2) Horses shall be of good size, quality and conformation and shall be free from all hereditary unsoundness; these conditions to be ensured by submission annually to a thorough, careful examination either at the hands of the Veterinary Director General or such other members of the veterinary staff of the Department, or other persons as the Minister may from time to time appoint for this purpose.

(3) Horses so approved shall be duly and properly advertised to stand for service of mares, under the ordinary and general conditions usual in the districts in which they are to be kept, at an annual service fee (except in the case of Thoroughbred mares) of not more than $10.00 to insure, such service fee to become due and payable only when mares prove to be in foal.

Any person, firm or corporation owning or controlling any Thoroughbred Stallion in regard to which all of the conditions above set forth shall have been duly and properly fulfilled, shall, on production of satisfactory evidence thereof and of the fact that a reasonable number of mares, other than Thoroughbred mares, have been served during the season, be entitled to receive at the close of each such season the sum of $250, from the funds of the Live Stock Branch.

"NOW I have the best roof in this township. One that will last—one that's waterproof—one that will resist the hardest storms—and I didn't have a bit of trouble laying it."

That's about what every Amatite owner says. Its superiority over all other ready roofing is apparent to anyone who uses it.

Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface that *needs no painting*. It is durable, fire retardant, practical, economical.

Don't buy any other roofing till you look up Amatite. Write to nearest office for samples.

Everjet Elastic Paint

Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for "rubber" roofings and all exposed iron and wood.

Weak Men Listen

ELECTRICITY WILL CURE YOU

Electricity is animal vitality. It is the foundation of all strength. It is the fuel to the engine which runs the human machine. Electricity, as I apply it, is a source of new life to all parts of the body.

No man should be weak; no man should suffer the loss of that vital element which renders life worth living. No man should allow himself to become less a man than nature intended him. no man should suffer for the sins of his youth, when there is here at hand a certain check for his weakness, a check to his waste power. Most of the pains, most of the weakness of the stomach, heart, brain, and nerve, from which men suffer, are due to an early loss of Nature's reserve power through mistakes of youth. You need not suffer for this. You can be restored. The very element which you have lost you can get back, and you may be as happy as any man that lives.

DR. McLAUGHLIN'S ELECTRIC BELT

Restores the snap the vim and vigor of youth. Any man who wears it can be a giant in mental and physical development. Men, are you weak,, have you pains in the back, varicocele, weak stomach, constipation, lumbago, rheumatism, enlarged prostrate gland, or any of the results of early mistakes, excesses or overwork? Our method of applying electricity while you sleep at night will cure you. It fills the nerves with the fire of life.

EVIDENCE COMES FRESH EVERY DAY.

Strong and Active Again.

Molesworth, Ont., Dec. 28, 1911.

M. F. McLaughlin:—

Dear Sir,—I take great pleasure in asking you to file my name as cured. I have worn your Belt as directed for four months, and I feel like a new man. I am strong and active again, and feel as well as any one could feel. Wishing you every success in your business, I remain, Yours very truly, WM. H. Lynn.

Cured of Weak Back and Tired Feeling. in One Month.

M. F. McLaughlin:—

Dear Sir,—I am very thankful to say that I feel much better, both in health and strength. My back is not like it was, for I can do a day's work now. I now wake up in the morning feeling fresh, and not like when I had that languid feeling. I have more life in me now. I am well satisfied with the Belt and only wish I had obtained it before. Yours truly, Severine Cotreau, Wedge Port, N.S., July 26, 1911.

Mr. Thomas C. Morton, 75 Cameron St., Windsor Ont., says:—"Before I used your Belt, three or four years ago, I was unable to walk, but it improved me so much that I had no difficulty to walk after using it for some time and my advice to all sufferers is to use one of your Electric Belts. No doctors; no drugs, just one solid comfort. I hope your good work will be kept up."

I HAVE AN ELECTRIC BELT THAT DOES CURE, and I am offering it to you in such a way that you take no chances whatever. Give me your name and address with a statement of your case, and I will at once arrange a Belt suitable for your case, and

WINNIPEG TORONTO

Home Mixing and Application of Fertilizers.

(Continued from page 468).

applying the fertilizers in the drill with the sowing attachment but we prefer broadcasting. Of course we realise that a lot of time is saved by combining the two operations. By the broadcasting method of sowing, the fertilizers become more thoroughly incorporated with the soil and thus a more extensive root growth is encouraged. The succeeding crops also grow and ripen more evenly than where the fertilizers are applied in the drill.

In conclusion. We have endeavored in this short article to outline, somewhat briefly perhaps, the method and some of the advantages to be gained by "home-mixing."

It is for each farmer to decide whether this method or the use of mixed goods is most profitable in his particular case.

To Concrete a Cellar Floor on Wet Land.

(Continued from page 462).

board back about two and a half feet and fill in your space which is easier to get level as you have the concrete already laid on one side and the board on the other to go by. By finishing the bottom coat in this way it will take 20 cubic feet of gravel and 2 6-17 bags of Canada Cement to cover 100 square feet.

The finish coat is mixed, one part Canada Cement to four parts of sand and mixed wet enough so it will spread out easily with a Mason's trowel, as you spread even to the guide board run the trowel over it a few times and you will get a smooth surface. Now cut your one and a half inch guide board in halves take one piece of it and round up the ends a little so they will not catch, and draw it along on its edge in the finish coat about 6 inches from the wall pressing on it heavy enough to make a little water trench to carry off any water that may soak through the wall above the concrete. This is done as you work along the wall before the finish coat sets, smoothing off the ridges on each side of the trench with your trowel as you go along. By making the finish coat in this way it will take 12½ cubic feet of sand and 2 6-17 bags of Canada Cement to the 100 square feet.

I have concreted the floor in my cellar in this manner and it is giving good satisfaction, part of it I did in 1910 and the remainder in 1911. House is 24 x 32 feet with a kitchen 18 x 18 feet the work being done by one farm hand and myself at odd times. Counting our labour at $1.50 per day it would cost $3 for doing 100 square feet not counting time of digging out the cellar deeper than it was before. The stones used in the bottom were picked off the land and I was glad to get them out of sight. The gravel cost me nothing, only the hauling. It is needless to give cost of gravel as no two districts are in the same position to get it and you will think the same applies to Canada Cement as it costs 65 cents per bag, but we return bags and get 10 cents back. We can get cheaper Cement than the Canada Portland but a few cents don't amount to much on the difference between a good job and a poor one.

The cost of concreting 100 square feet of my cellar floor putting labour @ $1.50 per day.

Cement @ .55 per bag.
Gravel @ 1.00 per yard.
Sand @ 1.00 per yard.

Would be $5.85, this includes the breaking of the stones for foundation.

Horsemen Attention!

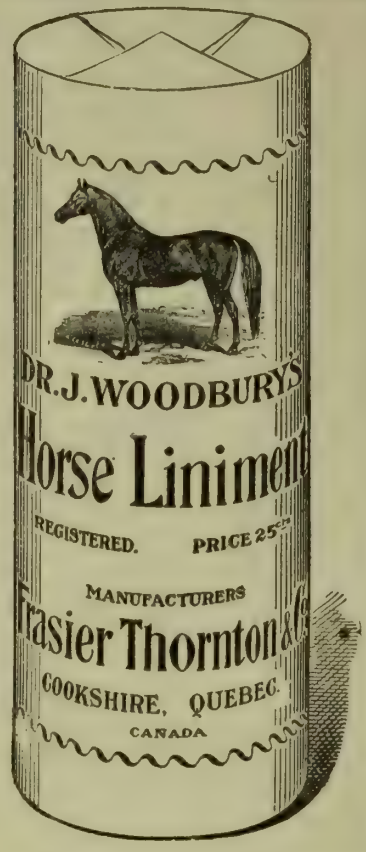
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

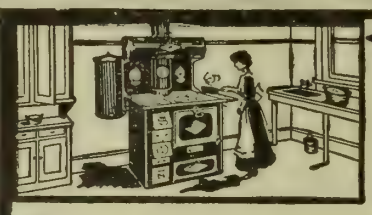
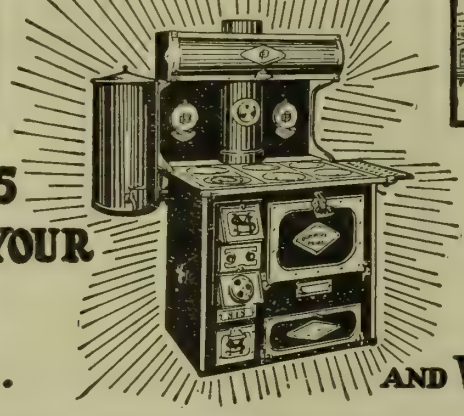
Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.



←DIRECT FROM FACTORY TO KITCHEN←



SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

$41.00 TO $49.00

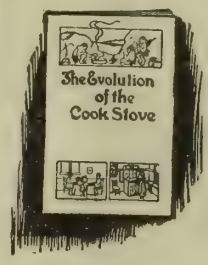
AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of **tough, strong, malleable iron** and the **best blue polished steel**—materials which **will not warp, crack or break.**

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it **saves over 30% of fuel,** burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. **If not convenient to pay cash we will arrange to accept your note.**

When writing it will be a distinct favor to us if you will mention this paper. 7

"It Took Me Fifty Years to Know How to Give You Better Roofs than any other Man"

"I tell you, every farmer in Canada should realize the big share a good roof has in making a good barn. That is my life-work—making roofs. I have been making my roof better and better for more than fifty years. What I have done for farm roofs is one of the biggest things ever done for people who farm."

"You ask me why a barn roof is so important. I will tell you. You build a barn and expect the roof to protect it many years. You put thousands of dollars' worth of produce under that roof while it lasts. Every pound of this produce costs you hard work. If a poor roof lets it get spoiled by wet, you lose money year after year. This lost money is many times the roof cost. Some roofs will last for several years. Some roofs will last if they are kept painted. But a roof is mighty hard to get at. It is not too safe to work on anyhow. Once a roof starts to leak, it is often left as it is. The result is the things you have in your barn spoil. This is lost money, and soon amounts to more than the cost of a good roof."

A Roof for Any Man

See What a Good Roof Can Do!

"I have spent my life making a low-cost roof that any man or his tinsmith could lay right. This roof of mine saves the stuff stored under it. It saves the barn framing and beams. It saves the foundation. This roof of mine doesn't need special roof timbering at all."

Good for 100 Years

"The big point about my roof is that it cannot develop leaks after you have had it up a year or two. It is a real roof from the first year it is on your barn to the last year. And do you know when that 'last year' will be? You will use that barn, and your son will use that barn, and your grandson will use that barn before that 'last year' comes. I want to pound the fact home to you that when you get a roof from me, you get a roof that is good for one hundred years. Think of getting a roof that makes your barn good for a hundred years. And that at about the price of an ordinary roof."

"That is why I say, 'I have helped the farmer more than any man ever did.' My roof will protect a good $100,000 of produce in your barn in 100 years. A roof that will do that is worth going after a good long ways."

Stands the Arctics

"This roof is so good that the Canadian Government Bernier Arctic Expedition used it for the Arctic regions. Here is immense cold and sweeping winds and ice and poor foundations to stand up under. The North-West Mounted Police use it. The Canadian Government has found no better roof for them. My roof is a good roof for the Arctic Circle. It is a still better roof for milder climates elsewhere."

Stands the Tropics

"But that is not all. My roof is used in the West Indies. Here is a temperature of 135 degrees at Porus, Jamaica. My roof stands it. In Jamaica during rainy season at Montego Bay, rain falls 10 inches in a single day. My roof stands it. In Ontario rain falls 30 inches in a whole year. My roof in Jamaica stands in 24 hours the rainfall it has easily 4 months for in Ontario. Is that a good roof? Is a roof that stands the severe conditions in both Arctics and Tropics good enough for you? You get exactly the same article, made on the same machines."

Used All Over the World

"Not only that, go down to South Africa. Go to the farms there. Go around Port Elizabeth, or Durban, or up in the Transvaal. You'll see my roof there. People will go around the world for my roof, because it is the best roof in the world. It will last 100 years. People use my roof in Japan—an earthquake country. They get it from me. They have searched the world for a roof that would stand earthquake straining. My roof will."

This Took 50 Years

"You are beginning to see something of the big work I have done. I have made a low-cost roof that stands terrific cold and heat, that stands tremendous rains, that stands ice, that stands earthquakes. In fifty years, I have made Pedlar roof better and better by little points added every year. It has world sales to-day, just because it is the best roof in the world at its very moderate price."

MY LATEST TRIUMPH

"Then, a few years ago, I put my finishing touch that made my roof wonderful. I had been troubled, not by my roof design, but by the metal in it. It seemed impossible to get a metal which would not rust. I had to take the best metal I could get. The design was all right. I had been making that design better for fifty years. At last I struck a clew in Europe."

"You know they have cathedrals there that are hundreds of years old. Yet the iron hinges on the doors are as good as ever to-day, though they were hammered out hundreds of years ago. I said to myself, 'Why not make up my roof in this peculiar kind of iron, so my roof will last like those door hinges?' Well, sir, that was a hard job. It was hard to get that iron duplicated. I worked for a long time and my chemists worked with me to get it. I stuck to it just as carefully as I had stuck to bettering my roof. And I got it at last. That's the metal I use to-day."

You Get the Benefit

"My roof is the only roof in the world with this kind of non-rusting iron in it. I am the only man a farmer can come to and say, 'I want a hundred-year roof at about the price I would pay for cedar shingle.' I am the only man that can deliver that kind of goods.

"My roof will not rust to the leaking point within 100 years. It saves the barn and its product from the weather. It saves the barn from thaw-water and lodged ice, because the seams cannot be gouged apart. It saves the barn from fire, because sparks cannot burn it. A burning stick on the roof will not harm it, or harm the barn under it. Lightning cannot burn a barn with my roof on it. My roof is a perfect conductor of electricity. My roof has 'give' in it to defy heat and frost, and protects in winter and summer. It protects even though the rafters sag. Wind cannot blow my roof off a barn. This is because it is a ventilated roof. It keeps your barn ventilated and stands the heaviest winds safely."

Get My Barn Book

"I want to send you my book, 'ROOFING RIGHT.' This lets you dig into more facts about the Pedlar roof. You will see how clean it is. It gives the best cistern water you can gather, as it is self-cleaning. This book shows scores of good barn designs—the best barns in Canada. Every one has my roof on it. You will get big help from my book, and I will send it free for a post-card request. Let it plan your barn. Write me to use."

"I am the best friend the farmer has, because I have given him one of the best roofs in the world at a very low cost. I want to send out more of my barn books, because I want to see good barns built. I send a book free to you, if you will ask for it. Write me to-day."

WHEN WRITING ASK FOR PEDLARIZATION BOOKLET

SEND FOR OUR FREE BOOK ON "HOW TO BUILD RURAL TELEPHONE LINES"

YOU do not need to know anything about company organization or telephone line construction to start a telephone company in your own community. "How to Build Rural Telephone Lines" will tell you absolutely everything you need to know. When you have read this book you will be amazed at the simplicity of the whole proposition and wonder why you and your neighbors have not had a telephone system of your own long ago. Sooner or later someone is going to start a telephone system in your neighborhood. Whether you or one of your neighbors chances to be that "someone," you owe it to yourself to be fully informed on the subject.

We Send This 100-Page Illustrated Book Only on Request

THIS book contains seven chapters of detailed information on the construction of rural telephone lines, abounds in photographic illustrations and diagrams and deals with every vitally essential fact as does no other book in existence. Remember this book has cost too much money to prepare to send it out haphazard. While we will be glad to send you a copy, we will not do so until you ask for it. If you are interested in the subject send us the coupon and we will send you one copy of this volume free by return of mail.

Let Us Teach You How To Start Your Own Telephone Company

THE full details of company organization are described in this book. Mutual and stock companies are explained fully so that you can go out among your friends and neighbors and show them just exactly what has to be done.

Let Us Show You How To Build The Line and Put In The 'Phone

THE expert advice of high salaried telephone engineers is back of you in every detail of your line construction. With the help we give, you do not need to employ expert linemen but can keep down the cost by doing your own construction work. One chapter of our book alone shows thirty-seven diagrams and illustrations dealing with this branch of the work. On request we will also tell you of your provincial regulations, what your government demands and what it will do to help you.

Take Free All Our Experience and Knowledge

LET us show you how to get the movement started so that your community can have a rural telephone system and you a telephone on your own wall. We offer you freely all the necessary information and our entire experience is at your disposal for the asking. Send us the coupon now and get your copy of "How To Build Rural Telephone Lines."

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

Here's a big fencing convenience—Page Galvenized Fence Hooks—for fastening wooden pickets 1x1¾ on wire fences. Page Hooks are perfectly made, so there's no waste. We have, also, tools for applying hooks. At your service, also, Wire Locks, Wire Stays and Tools for same. Write us. (Address at top of this advt.)

This Year Own These Haying Helpers

Decide that you'll no longer labor under a handicap at haying time. Secure the services of these Frost & Wood Haying Helpers—**Giant 8 Mower and Tiger Auto Dump Rake.** For twenty years and more these efficient haying implements have saved time, money, labor and horseflesh for thousands of progressive Canadian Farmers. Think of the next score or more haying seasons.

Frost & Wood Giant 8 Mower Tiger Rake

The Frost & Wood Giant 8 Mower is not merely a "fair-weather" machine. It's right there with the power and cutting ability when other mowers are apt to fall down. Put it to work in a heavy or tangled crop and watch how easily it handles the job. You can start it anywhere in the field and the knives will begin cutting the instant the horses move forward. "Flying starts" are not necessary.

The Giant 8 has great driving power because of the simple and compact arrangement of the gears. Smooth-running and light dratt are assured by a plentiful supply of large roller bearings. The cutter bar is protected against wear by steel plates. Large bearings—not pins—are used for the connection between cutter bar and main frame.

At every point, in its construction, is put the skill and knowledge gained in over 70 years' experience in building farm machinery to meet Canadian conditions.

The Tiger Automatic Dump Rake is the best sulky rake made. It has given satisfaction for many haying seasons. The teeth are shaped to do the most efficient work. They are made of a special grade of steel, that has proven by test, the best adapted to withstand heavy work and severe usage.

Strongly constructed throughout, is the **Tiger Automatic Dump Rake.** It is a rake that will pay you large dividends of satisfaction at haying time. When you require anything in the way of farm equipment remember our agents can supply your wants. We have catalogs describing and illustrating the different lines; they are cheerfully mailed free for asking. Let us send you one to-day.

"Scrub" Cream Separators as Unprofitable as "Scrub" Cows

This is the good advice one of the big and long experienced American cream buying concerns gives to its farm separator patrons, being taken from a letter to one of them:

"We believe the DE LAVAL is the best separator made. We feel that anyone wishing to purchase a separator makes a great mistake unless he purchases the best machine on the market. No one can make a success of dairying by continuing to use scrub cows. Neither can he make a success of dairying by using scrub separators."

There couldn't well be a more simple, comprehensive and forceful statement of the whole cream separator proposition than this. It's just plain common sense.

How I Grow Potatoes on a Business Basis

By A. E. L. Fritze, Lunenburg, N. S.

Awarded Second Prize in the Maritime Farmer's Potato Growing Contest.

THE growing of potatoes successfully, like the realization of success in every branch of farming, varies as does the tenacity of the individual, even when following minutely the theory of the Professors of Agricultural Colleges.

Success can only be attained after we can conscientiously say that we have undoubtedly given it a very thorough trial in every detail. A plan which I have followed for a number of years, and which I feel convinced gives the ground the best tilth, is to plow the sod, the earlier the better, if quite early after haying roll it and after a few weeks, or a couple of heavy rains, harrow with a disc harrow. The heat and moisture being necessary to rot the sod. If it is done later in the fall which is usually the case with me I do not harrow, as the action of the frost is somewhat lessened, which loss is perhaps as vital as the extra rotting of the sod. If a rich sod or clover it will be easy to make it as fine as any alluvial soil and is consequently as good as required. As soon as the ground is dry in the spring harhow with a disc harrow, in each trip across the field overlap half of the last trip, which prevents the surface becoming irregular, then harrow at right angles, and twice criss cross. After a week or ten days of sunshine repeat and, if time will permit, give it a third harrowing. By this time the ground is as fine as flour; the weeds should have all come up and been destroyed.

Minnie and Major.

Prize winners at the recent Maritime Horse Show. First and third Grade Heavy Draughters. First and Grade Heavy Draught Teams. First and Second Agricultural Horses. First Agricultural Team. Minnie and Major were both sired by the Clydesdale Stallion, Prince of Annick. Owned and exhibited by Fowler Bros., Amherst Point, N. S.

Last year, for the first time, I had my potatoes all planted during the first week in May. I had in previous years never began to plant before June 3rd. I find that while the earlier planting does not come up as quickly, the plants resist drought better, and escape the first rot, so common the second week in August.

Last year when the ground was properly prepared for planting May 26th, I sowed broad cast 500 lbs. Albert's Basic Slag, 200 lbs. Murate of Potash per acre, and harrowed in with a light harrow. I then took all the hoes off the cultivator, with the exception of the deep one behind. One of the men lead the horse the first trip to insure the rows being straight, and made the rows about 28 or 30 inches apart. As soon as a few furrows were finished, two of the hands began dropping the seed, and finished the field of an acre about the same time as I did covering them up. To cover them up put on the hillers, care being taken to closely observe the last row on the side of the field you begin on, to insure all being covered, a thing impossible to do if you try to watch both rows. The field presents a fine appearance as the rows can be run as straight as a line. The potatoes being on hills can be the more readily cultivated, three or four days after the first ones have come up.

I cultivate and spray every few days as per the annexed record with Bordeaux mixture, using 5.4.40. the extra amount of lime seems to make the mixture stick better. The nitrate of soda was applied broad cast just before cultivating, and the result was very noticeable. In planting I cover deeper, as a drouth may cause the seed to perish if planted any shallower. The distance between the seed to give the best results in digging is about 15 inches. The seed was cut with one good eye never more than three, a larger number of eyes usually produces two many stems, the potatoes usually being smaller. The potatoes on one part of the field did not look very promising when they came up, being spindly, and I think this was caused by the crows digging up the seed, I believe they destroyed about a bushel in this way. The stalks remained green until the frost came October 12th.

There were ten bushels of seed in the field, the varieties were Bovee and Green Mountain. We began using Bovee July 24th. They were small but dry, each week they got better: in September many weighed 1 1-2 lbs., and a few nearly 2 lbs. After selecting seed of medium size from the hills having the largest number of tubers, we harvested nearly 200 bushels; there were not five bushel of unmarketable potatoes, and not one rotten one.

From experience I may say I find the mixture of the bordeaux and the application of it the most difficult to master, but once learned thoroughly you may do the work quickly and with confidence as to the results. The mixture should be put on with as much force as possible.

The selection of the seed, and the care of the same during the winter is another important factor.

The growing of potatoes is becoming a most vital question, as each year the demand exceeds the supply, and therefore offers the farmer a safe and profitable investment.

Record of 1 acre of potatoes grown 1911		
Plowing Nov. 1910 8 hrs.	$2.50	
May 1911 harrow 3 days	7.50	
Cost of Bassic Slag 200 lbs.	2.00

Aug. 18th, Sprayed with Bordeaux Mixture.

THE HOME VEGETABLE GARDEN.

Plan Large Assortment and Continuous Supply.

The home garden should be planned with a view to furnishing a large assortment and continuous supply of vegetables through the entire season. Its size will depend primarily upon the amount of land the owner desires can be reserved for a garden, vegetables to be stored for winter as well as the summer supply, should be grown. On the village lot, space may be insufficient to grow more than the summer's supply, and it may also be necessary to leave out certain vegetables that require a large amount of space. On a city lot, the space available for growing vegetables is necessarily small, and plantings must usually be confined to those vegetables which produce a large amount of edible product for the space occupied.

Whether the garden is on the farm, in the village, or on the city lot, the principles governong its planting and care are the same although the distances of planting, methods of tillage, and intensity of cropping may differ widely. On the farm, the saving of labor is more important than the saving of space; even the small vegetables are planted in long rows rather than in beds; and horse power is substituted for hand power wherever possible. In the village and the city, the vegetables must usually be planted as closely as the nature of their growth will permit, and hand tillage employed almost exclusively.

Much loss of time in planting a garden can be avoided by making a definite plan of the garden several weeks or even months before the planting is to begin. After measuring the area to be used for the garden, the next step is to decide what vegetables are to be grown. If space is ample, this will be determined primarily by the personal tastes of the gardener and his family. However, if only a limited amount of time and attention can be given the garden, it may be wise not to undertake the growing of some of the more exacting crops. Whatever the space to be devoted to gardening, the crops to be grown should be decided upon long before the time of planting.

In planning the garden, it is well to arrange the vegetables in the order in which they are to be planted. This facilitates the preparation of the land for planting, and makes it possible to maintain the unplanted portion in a good friable condition with the least expenditure of labor. In order that the vegetables may be so arranged, it is necessary to know the proper time for planting each crop. This depends primarily upon the temperature and moisture requirements of the particular crop in question.

Lady Primrose

First prize three-year-old Clydesdale mare and winner of the Championship Diploma for best mare, any age at the recent Maritime Horse Show. Lady Primrose is a full sister to Baron Graham the Champian Stallion in 1911. Her sire is Baron Primrose the 1912 Champion Stallion. Owned, bred and exhibited by C. R. H. Starr & Son, Port Williams, N. S.

Model Performer

Champion Hackney Stallion at the recent Maritime Horse Shown. Owned and exhibited by R. A. Snowball, Chatham, N. B.

TEMPERATURE AND MOISTURE REQUIREMENTS OF DIFFERENT VEGETABLES.

The vegetables grown in our gardens are native to many different countries, differing widely in climatic conditions. Each kind of vegetable has its own peculiarities and thrives best under certain conditions of soil and climate. When an attempt is made to grow many sorts in the same garden under the same conditions, it is not surprising that difficulties arise, and that some thrive better than others. Many of the difficulties can be overcome, however, by adjusting the time of planting each crop to meet its temperature and moisture requirements as fully as possible. Failures in gardening often result from planting some crops too early and others too late. Each should be planted at the season most favorable to its development.

Vegetables are usually classified as "hardy" and "tender". This classification is based upon the fact that certain vegetables will endure the ordinary frosts of spring without injury, while others would be killed if subjected to the same temperatures. This classification implies that danger of frost injury is the chief distinction between the two classes of vegetables, and that while the "hardy" vegetables can safely be planted "before danger of frost is over," there would be no objection to planting them after that time, and that danger of death from frost is the only reason for late planting of the tender vegetables. As a matter of fact many of the so-called hardy vegetables would be as utterly ruined by the heat and drought of summer as are the tender vegetables by the light frosts of spring. They demand cool weather, and without it will not produce an edible product. Furthermore, the danger of death from frost is not the only reason the so-called tender vegetables should not be planted early. The cool weather normal to that season of the year, though no killing frost occurred, would preclude the proper growth and development of the crops in question, for they thrive only in warm weather. A more satisfactory wording for this classification of crops would therefore be "cool season" and "warm season" crops, for these terms suggest the conditions under which the crops must be grown to develop satisfactorily, rather than merely designating their susceptibility to, or immunity from, frost injury.

While vegetables in general may be classified as cool season and warm season crops, the different vegetables in each of these classes do not all thrive equally well under the same conditions of temperature and moisture. Although all the cool season crops will germinate and grow at a relatively low temperature, and demand comparatively cool weather for their highest development, some will endure and even demand, lower temperature than others. The converse also is true; some will endure much higher temperature than others.

COOL SEASON CROPS.

From a cultural standpoint, the cool season crops may be divided into three general groups. (1) The first group is composed of short season crops which cannot endure the heat of summer, but which can safely be planted in the open ground sufficiently early to attain full development before the normal season for hot weather. The following vegetables belong to this group: garden cress, kohl-rabi, leaf lettuce, mustard, peas, radisnes, spinach, turnips. Of these crops, cress, lettuce, mustard, and spinach will stand slightly lower temperature in the seedling stage than the other crops mentioned. However, in practice they are usually all planted "as soon as the ground can be worked in spring" or at the ideal time for seeding oats. Additional plantings of lettuce, radishes and peas can be made somewhat later for the sake of securing a succession, since radishes and lettuce grow quickly, and peas can stand a slightly higher temperature than most of the other crops of the group. Any later plantings of cress, mustard, spinach, or early turnips are usually overtaken by such high temperature that the products are of little value, so that it is possible to work the soil. Such crops any later than the very opening of spring.

All the crops of the above group require an abundant supply of moisture throughout their entire period of growth, and this is normally provided by the copious rains characteristic of the spring months.

Some of these crops can also be grown in the autumn if there is sufficient rainfall to supply the needed moisture. Turnips, radishes, lettuce and spinach are the crops best adapted to this purpose.

(2) The second group of cool season crops consists of those which which at the same time have so long a period of growth that it is impossible for them to complete their development before the normal season of hot weather, if the seed is planted in the open ground even as early as it is possiblt to work the soil. Such crops are early cabbage, early cauliflower and head lettuce. The only way that these crops can be grown with any assurance of success, is to start the plants under glass and have them ready for transplanting as early as the weather will permit. This will be about the time the second planting of radishes and peas is made.

Another crop having temperature requirements similar to those of cabbage and cauliflower is celery; but this crop requires so long a season that it is impossible to grow it as a spring planted crop except in northern localities, where the summers are relatively cool. Together with late cabbage and cauliflower, it can be grown as a summer planted crop designed to make its principal growth during the cool, moist weather following the autumn rains. Cool, wet seasons favor their development. In hot dry years they may fail utterly. As commercial crops, they reach their highest development only in relatively cool climates.

(3) The third group of cool season crops consists of relatively long season crops, demanding cool, moist weather during the earlier stages of their development, but capable of enduring considerable heat and even drought after becoming fully established. This group includes beets, carrots, chard, kale, leeks, onions, parsley, parsnips, early potatoes, sal-

sify, upland cress, and New Zealand pinach. It also includes the perennial crops asparagus and rhubarb. All of these crops should be planted relatively early, though extremely arly planting is more important with ome than others and is especially mperative in the case of onions. In actual practice, all the vegetables in this group, together with those of Group 1, may be planted as soon as the ground can be worked in the spring. If, however, the early planting is followed by unusually cold, wet weather, replanting of the beets, carrots, chard, and parsnips may become necessary, for these crops do not germinate readily at as low temperatures as onions or kale, nor will the seedlings survive so severe a frost.

The vegetables in this group are exceedingly satisfactory to grow, for they have an extremely long period of edibility, relatively few enemies, practical immunity from injury by heat or cold, excessive rain or drought, and are practically certain to yield an edible product, even under somewhat trying conditions.

WARM SEASON CROPS.

The warm season crops fall naturally into two groups. (1) The first group includes those with a sufficiently short period of growth to enable them to perfect their product during the normal season of weather favorable to their development. Such crops can be planted in the open ground after the weather has become sufficiently warm in spring, and will complete their growth and mature their crop before the plants are killed by the frosts of autumn. This group includes string beans, Lima beans, sweet corn, cucumbers, gherkins, muskmelons, watermelons, okra, squashes and pumpkins. Of these crops, string beans and sweet corn will germinate at a lower temperature, and hence can be planted earlier than the Lima beans and the vine crops. All the crops in this group demand warm weather, but some of them will suffer if the weather is excessively hot and dry. Those most resistant to drought are gherkins, watermelons and okra; and these crops are especially adapted to southern localities. Cucumbers demand more moisture than any of the other crops in this group, and if possible they should be planted in a depression where the soil will be moist.

(2) The second group of warm season crops consists of those having so long a period of growth that they are unable to mature a full crop unless started under glass considerably in advance of the normal season for weather suited to their growth in the open. This group includes eggplants, peppers, sweet potatoes and tomatoes. Of these, eggplants and sweet potatoes demand a higher temperature than tomatoes and peppers, and under normal seasonal conditions should not be transplanted to the open ground until two or three weeks after the ideal time for setting tomatoes. Eggplants and sweet potatoes are especially suited to growing in localities subject to severe drought, for after these plants have once become well established, their demands for moisture are not great, and the more intense the heat, the better they grow.

The wide differences in the temperature and moisture requirements of the various vegetable crops, as above outlined, explain why some crops thrive much better some seasons than others, in the same locality, and also why certain crops are most extensively grown in certain localities. However, careful attention to the time of planting each crop, in view of its particular temperature and moisture requirements, will enable the gardener to grow to perfection a much larger assortment of vegetables in the same garden than could possibly be done without consideration of the specific requirements of each particular crop.

THE FARMER'S VEGETABLE GARDEN.

The most distinctive feature of the garden on the farm should be the reduction of hand labor to a minimum. In planting the garden, therefore, it should be laid out in long rows, sufficiently far apart to permit the use of a horse and cultivator in tending the crops. Time and confusion will also be saved if the vegetables are grouped according to their cultural requirements, and the number of plantings made as small as is consistent with the demands of the various crops. Each group of crops may then be planted and tended as one crop, and the garden operations thus greatly simplified. When more than one planting of a given crop is desired for the sake of securing a succession, the second planting may be put in at the same time that other crops are being planted, so that even in this case, the number of plantings need not be multiplied. The use of two or more varieties of the same vegetable, differing in their time of maturity, will also aid in keeping down the number of different plantings.

THE PLAN OF THE GARDEN.

The exact plan of the garden will depend upon the personal tastes of the owner, and will be different for each individual; but in any case, much loss of time in planting will be avoided if a definite plan is made before the planting season arrives. The accompanying plan is presented merely as a suggestion, and illustrates one possible arrangement of a farmer's garden planned with a view to securing a large assortment and continuous supply of vegetables, and at the same time simplifying the planting and minimizing the labor of tillage. The area designated comprises nearly one-half acre, but smaller or larger gardens rould be arranged in much the same way. Except where noted, the rows are three feet apart.

The planting of the garden might be as follows:—

Row 1.—Perennials: 1-2 row asparagus; 1-3 row rhubarb; 1-6 row perennial onions.

Row 2.—1-6 row parsley; 1-3 row carrots; 1-2 row parsnips. (Marked with turnip radishes).

Row 3.—Onions (yellow).

Row 4.—1-2 row early beets; 1-2 row onions (white). (Marked with long radishes).

Row 5.—1-6 row lettuce; 1-6 row onion sets; 1-6 row turnips; 1-2 row spinach.

Row 6.—Peas 1-2 row extra early smooth; 1-2 row early dwarf wrinkled.

Rows 7, 8 and 9.—Early potatoes.

Row 10.—Peas: 1-2 row early dwarf wrinkled; 1-2 row late wrinkled.

Row 11.—1-4 row early cabbage (30 plants 2 feet apart); 1-4 row cauliflower; 1-6 row lettuce; 1-3 row beets (marked with long radishes).

Row 12.—1-4 row summer cabbage (transplanted); 1-4 row of same (seed sown); 1-2 row string beans.

Row 13.—Sweet corn: 1-2 row extra early; 1-2 row second early.

Row 14.—Tomatoes: (60 plants 4 feet apart). (4 feet from row 13).

Row 15.—1-2 row Lima beans; 1-4 row string beans; 1-4 row peppers (30 plants). (4 feet from row 14).

Row 16.—Late cabbage: (seed sown).

Row 17.—Sweet corn: 1-2 row extra early; 1-2 row second early.

Row 18.—Sweet corn: two late varieties.

Rows 19, 20, 21 and 22.—Vine crops in hills 6 x 6 feet, in blocks crosswise the four rows, as follows: 40 hills cucumbers; 12 hills summer squash, 28 hills winter squash, 40 hills watermelons, 40 hills muskmelons.

It will be observed that the vegetables are arranged strictly in the order of their planting, so that planting may begin at one side of the garden and proceed across the area as the season advances. This makes it possible to easily fit a piece of land for planting or to harrow the unplanted portion at any time desired and thus keep it free from weeds and in a moist, friable condition. Another feature of this plan is that while two or three kinds of vegetables may be planted in the same row, all the crops in a given row require essentially the same kind and amount of tillage and other care. It is also true that the crops occupying the land about the same length of time are planted together. After the early maturing crops are harvested, it is therefore possible to clear quite a wide strip of land for the planting of turnips and other late crops, if desired.

While this plan specifies different times of planting, besides the celery, late beans and turnips, it is possible in some seasons to combine the second and third plantings, so that if celery and sweet potatoes are omitted, there will be only three plantings besides the turnips or other incidental late crops. This simplifies the planting and better adapts the garden to the tastes of the average farmer.

PREPARATIONS FOR PLANTING.

The arrangement of the garden as to length of rows and time of planting, is not the only labor saving feature that should characterize the typical farmer's garden. Field methods should be practised in preparing the land for planting, and as much preliminary work done in the fall as is possible, for the sake of both securing an early garden and reducing the amount of labor in spring. After the land is cleared of refuse from preceding crops, it should be heavily manured, and plowed in the fall. The amount of manure to be applied will depend somewhat upon the fertility of the land, but more largely upon the trueness of the farmer's conception of the plant food requirements of garden crops. The best gardens are possiqle only where plant food is supplied much more liberally than is considered ample for field crops. Forty tons of manure per acre is a very moderate application for garden crops, and this amount should be applied annually, even on soils already rich, if maximum crops of vegetables are to be grown.

The plowing under of manure in the fall hastens the drying out of the soil in the spring, so that planting may begin earlier than if the manuring and plowing were deferred until spring. This is both because the soil actually dries out earlier, and also because no time is lost in manuring or plowing after the soil has reached workable condition. It often happens that early in the spring when the cool season crops should be planted, the soil remains in ideal condition for working only a brief period, and then becomes so thoroughly wet by copious rains that further garden work is precluded for two or three weeks. If the manuring and plowing have been done in the fall, it is often possible to plant the early vegetables in the brief period during which the soil is fit to work, while otherwise this entire period might be expended in making preparations, and the actual planting necessarily deferred until the next time the soil was dry. Since the success of many of the early crops depends upon early planting, the wisdom of fall preparation is apparent.

If the land has been manured and plowed in the fall, and is worked at

GREAT DANGER IN PLANTING IMPORTED POTATOES.

The following warning notice is being sent out by the New Brunswick Department for Agriculture:—

In view of the great scarcity of potatoes in several sections of the province and that many hundreds of barrels have been imported from Great Britain, our farmer should realize the danger of introducing one of the most serious potato diseases yet known, by planting this imported seed. The disease known as "Black Scab," "Warty Disease," "Cauliflower Disease" or more properly "Potato Canker" has been spreading rapidly in European countries during the last fifteen years. It was first known in England in 1901. It was imported to Newfoundland in 1908, and there is grave danger of its introduction here by the importations of European potatoes that have been made during the past winter. Any one wishing full information in regard to this serious disease may obtain it by addressing H. T. Gussow, Botanist to the Dominion Experimental Farm, Ottawa, requesting a copy of Bulletin No. 63. After obtaining the information contained in Mr. Gussow's bulletin, no potato planter will wish to risk introducing this very virulent and destructive disease to his land. The disease comes from spores which are introduced into the land from the infected seed potatoes. It is stated these spores will live in the soil for years, so that a field when once infected is not safe again for potatoes for a long time. The disease is said not to be noticeable while the crop is growing, but when harvesting begins it will be found that in some cases the whole hill is destroyed, in other cases the destruction is partial.

This disease, if reports regarding it be true, is the most serious danger affecting potato growing known to-day, and every man who takes any interest in the future prosperity of the province, should prevent, as far as possible, its introduction here, The only safe and sure plan known at the present time is to rigidly abstain from planting imported seed, unless it has first been examined by a competent authority and pronounced free from the disease.

THE SEED BED.

An improperly made seed bed is like a shifting sand foundation for a house. The seed bed is the foundation for the crop. It must be so that it will receive and absorb rainfalls, be they light or heavy. Primarily they must be deep and mellow. A deep, mellow seed bed acts as a temporary reservoir to receive and hold water until it percolates into the deeper subsoils. If it is shallow, a rainfall of two or three inches during one shower will not be absorbed, but as soon as the hard pan is reached the surplus will run away.

A deep seed bed insures a rapid and strong development of young roots with strength to penetrate deep. A shallow seed bed means delicate roots which seek the course of the least resistance in the loose surface soils.

That statement can be verified by any farmer who takes the trouble to make a careful investigation. A deep seed bed means good ventilation and an abundance of room for plant food. It must be remembered that plant roots first seek water and they will go to it if they have strength, hence the farmer should exert every effort to encourage their early development.

In order to make this subject plain, let us start with a field of ripe grains. The grain shades the ground and in a measure prevents the broiling sun from drawing away the moisture.

Moisture is the elixer of plant life; every particle possible must be saved. How can this be accomplished? You know that the surface is full of cracks; you know that as soon as the grain is cut every stalk is an escape chimney. You know that moisture will escape through both cracks and stems. What should be done? The answer is easy. Stop up the leaks. Follow the binder with a disc harrow. That implement forms a mulch which effectually closes up the little openings and at the same time works into the soil the stubble. You have accomplished three very important things. First, you have checked the escape of moisture; second, the surface is made porous, an essential condition in the event of rains. Third, you have worked the stubble into the seed bed so that when the plow turns the furrow slice, the thrash will not act as an insulation to prevent capillary attraction.

The next step is plowing. The sooner the ground is plowed after harvest the better, provided that the plow is followed with implements, calculated to place the soil in a condition to store and conserve moisture. If the ground is plowed, and left loose and lumpy, it would be better not to plow at all until seeding time, unless the plowing is done late in the fall.

PLANT A TREE.

He who plants a tree,
Plants a hope.
Rootlets up through fibres blindly grope;
Leaves unfold into horizons free.
So man's life must climb
From the clods of time
Unto heavens sublime.
Canst thou prophesy, thou little tree,
What the glory of thy boughs shall be?

He who plants a tree,
Plants a joy;
Plants a comfort that will never cloy;
Every day a fresh reality.
Beautiful and strong
To whose shelter throng
Creatures blithe with song
If thou couldst but know, thou happy tree
Oft the bliss that shall inhabit thee!

He who plants a tree,
He plants a peace
Under its green curtains jargons cease
Leaf and zephyr murmur soothingly;
Shadows soft with sleep
Down tired eyelids creep,
Balm of slumber deep.
Never hast thou dreamed, thou blessed tree,
Of the benediction thou shalt be.

He who plants a tree,
He plants youth;
Vigor won for centuries, in sooth;
Life of time, that hints eternity!
Boughs their strength uprear,
New shoots every year
On old growths appear.
Thou shall teach the ages, sturdy tree,
Youth of soul is immortality.

He who plants a tree,
He plants love;
Tents of coolness spreading out above
Wayfarers he may not live to see.
Gifts that grow are best;
Hands that bless are blest;
Plant; Life does the rest!
Heaven and earth help him who plants a tree,
And his work its own reward shall be.

—Lucy Larcom.

ADVICE OF A MILLIONAIRE.

Thomas Neacy says:

A man makes his own luck.

If you make a promise, keep it, even if it takes the shirt off your back.

Be punctual, saving, temperate.

Remember that there is more honesty than dishonesty, nine times over.

A good wife is half the battle. Most of my bad deals have been made when I neglected to consult my wife.

If there is peace in the home, there is peace in one's work.

You can never tell just what is going to be the pivotal point of your fortune, so keep striving.

If a man doesn't recognize failure, failure cannot work him harm.

Sympathy and kindness go a long way in business.

If you are an employe, trust your employer; if you are an employer, trust your men.

Remember that work is the greatest thing in this world. When a man stops producing, he stagnates.

THE SEED SHORTAGE.

The nearer the seeding season approaches the more evident it becomes that seed of all kinds is abnormally scarce. This is more particularly true of timothy and mangels, but shortage extends more or less to all lines.

Those who acted on the warnings given from time to time and secured supplies early, have reason to congratulate themselves. Those who have put off until the last moment are likely to have to do with a short supply and of inferior quality.

NOTES.

Look at a proposition to see how you can use it—Not how you can get along without it.

The most successful dusiness man is he one who asks to be stown "why" he hould do a thing, and then does it.

Western Impressions.

Editor Maritime Farmer:—

For some years the West has been a constant drain on the Eastern Provinces of Canada. This is true particularly along agricultural lines and it is our rural districts that have sacrificed most on the altar of Western development.

Until the last six months when I became a Westerner myself I saw only the Eastern aspect of this Westward tide. Now I have seen a little of this end of it, which makes me wonder more than ever at the blind, unreasoning tendency of prosperous Eastern farmers to give up their well worked, comfortable, farms to build for themselves homes on the prairie.

Not for a moment would I speak disparagingly of the West. It is a wonderful country, a country of Golden opportunities, but outside the cities it is a hard country, a country that demands the best, a country where weakness spells failure. There is much about the West that one does not read in its wide-spread advertisements. One feels almost anarchistic. It is like throwing a bomb at the king or ridiculing the Fathers of Confederation to even hint that in the West there exists such peace destroying things as frost or loneliness or despair.

Undoubtedly fortunes have been made in the West, but when you hear of some man who came West probably five years ago, absolutely without capital and to-day is wealthy, just find out what happened between the beginning and end of his financial career. Sometime ago I was talking to a one-time homesteader, who six years ago borrowed the first ten dollars to pay to the C. P. R. for his land. To-day his farm is worth at a conservative estimate $10,000, but you would think he had earned it if you heard the story of those six years of cold and loneliness and discouraging drawbacks. Day after day he lived on one meal and borrowed the necessary stamp to send the home letter, which must go whatever else failed.

If a young farmer starting up in New Brunswick or Ontario would put up with hardships like that, would work as hard and as independently, would he not be just as well off at the end of six years, and there would be no overpowering counter account of loneliness and physical and mental hunger.

All through the New England States and our Maritime Provinces we find dozens of deserted farms, apparently good farms if properly treated, but now given over to a luxurient crop of young spruce trees and oxeye daisies. The buildings on these farms are very often good, very very good when you think of the shapeless little sod shack one finds on the prairie. Yet these farms have been sold for a few hundred hollars, or in many cases abandoned by their owners in order to take up land in Western Canada. In the Eastern part of New Brunswick I know of a block of over 800 acres of land, consisting of three abandoned farms, three fairly good farm houses and nine barns, which sold last year for $2,000. Three good streams crossed this block of land; four hundred acres of it are cleared and there is timber enough on it to more than pay for it. Of course the land was run down as is the land on most of the abandoned farms, but in five years, with up-to-date methods of farming this land could be made as fertile as almost any in the Province, but the owners have gone West. They have taken up land perhaps 20 miles from a station. Instead of the well-built New Brunswick house they are living in a one-roomed sod shack, divided into two rooms by a suspended piece of rag carpet. They must draw their fuel 20 miles, and most important of all, they must not let their supply run out. We have heard what has sometimes happened in such cases. They may have water near and they may not. A Nebraska farmer once told me that while travelling through the "bad lands" of Dakota he came to a deserted shack on the door of which was painted the following:—

"Sixteen miles from a railway,
Six hundred feet above water,
Six feet from hell;—
God bless our home."

And in all probability the optimist who left this final message had given up some fertile Eastern farm to try this get-rich-quick scheme in the West.

How seldom we hear anything about this side of Western life. It is the spirit of optimism that envelopes this Western World. Why is it? No one knows. This seems to be the land of new Hope, of the Second Chance. Everyone in the West is going to be rich to-morrow and as Stevenson says: "It is better to travel hopefully than to arrive" (perhaps). It is this same optimistic view that makes everyone in the West a booster. And look what they nave to boost in a great many cases. Why if New Brunswick were set down in the middle of the Canadian West they would be crazy about it, and there would be no more deserted farms or houses with empty, staring windows.

Splinter

Champion General Purpose Horse at the recent Maritime Horse show.
Owned by Spurgeon Gammom, New Glasgow, N. S.

People from all over the world would be rushing to it.

When I compare my preconceived ideas of the prairie with what I know about them now it is like drawing a comparison between a candle and the sun. There is a suggestion of unlimited strength and power about their vastness. The isolated homesteads intensify the loneliness. Your first thoughts are, "Oh the loneliness and the cold and the unending sameness of a life like this." But while nothing would persuade me to try rural life in the West, the City life appeals to me strongly. There is an exhilaration, an impetus, a sort of mental speed about it which is most fascinating. It is the Spirit of the West; everyone is a booster; everyone is willing to help you along if you are really trying to make good. I do not know whether it is the influence of the vast expanses of the prairie or the rugged strength of the mountains but all through the West one finds the same spirit of charity, of another chance given to the derelict to make good.

Westerners are extremists. They do everything to excess and at high speed. They work hard, they play hard, and like the little girl in the nursery rhyme, "When they are good, they are very, very good,—But when they are bad——??????"—Elizabeth Wood, Calgary.

Preparing Wool for Market.

At the Charlton Arms Hotel, Wellington, Shropshire, England, a very interesting address on "The Preparation of Wool for Market" was given by Mr. J. W. Collinson (Bradford), under the auspices of the Wellington District Farmers' Union, Mr. W. H. Lander presided.

In the course of his observations, Mr. Collinson said: "My visit is the result of the request from your secretary to the British Wool-Buyers' Association, one of whose objects is to assist in anything that will benefit the trade, whether from the user's or the producer's standpoint, because we consider that, rightly appreciated, those interests are identical. It is in this spirit that I have come to talk to you, and I wish you to look upon this occasion as one for the mutual exchange of opinions and ideas. My object is not only to give you my ideas as to the best way in which to present your commodity on the market, but also to show you the necessity of doing so, if our English wools are to remain in favour with the users of them. Let me say at once, that a visit of this kind is less needed in your locality than in some others I could mention, but I take it as an indication that you wish to present your wool even better than you already do, and I commend the spirit that has prompted you to ask for this interview. I may tell you that some of our spinners and manufacturers are so dissatisfied with the way in which some classes of English fleeces are delivered, that they are diposed to discontinue their use altogether, wherever possible, and I think you will agree with me that in these circumstances it is not only desirable but very necessary that our farmers should seriously consider the situation. A few weeks ago a deputation from the Lincolnshire Farmers' Union came to Bradford, and our Association took them to see Lincolnshire Hog wools in process of "sorting", and their chairman stated at their next meeting that some of the wools they saw had been delivered in a disgraceful condition. When you know that most of the larger clips from our Colonies are not only graded and packed in their different qualities, but that the fleeces are all "skirted" —that is, the bellies of the fleece are all removed and baled up and sold separately you will see that these wools are put on the market in such a way that it becomes imperative that the British wool-grower should not offer his commodity in a slovenly condition. I may further add that nearly all the Colonial wools are produced on grass-land, and are therefore free from the clogs that our turnip-fed sheep are troubled with. I am aware they have drawbacks in some districts in what are called "burrs", prickly seeds that grow upon the bushes on the "runs", but these are now all eliminated in the combing process that has been wonderfully perfected for the achievement of this object. I know that with our much smaller flocks the "skirting" process is scarcely feasible, but it doesn't alter the fact that we have to meet the wools that are so treated. And now having said so much on the competitive wools we have to meet, let us consider how best to meet the competition. I shall make a number of suggestions which I commend to your consideration. Let us start at the time when you begin to feed the sheep with hay or clover in the winter-time. Avoid feeding them with these classes of food in such a way that it can get into the necks or backs of the sheep, because it is practically impossible to get the seeds out afterwards, and such portions have to be taken out and sold at a very low price, a "shivvy or moiety wool". The only way to eliminate the seeds, &c., is to treat the wool with sulphuric acid, which destroys the vegetable matter, and doesn't improve the wool, but the reverse. Always thoroughly "clag" (burl) the sheep before they are washed. If there is a choice of water to wash in, choose the softest; the reason for this is obvious, as the softest water most easily cleanses the fleece. The best wash-dykes have a "good swim" out for the sheep, where this is, lifted with poles made for the purpose as they go along, the difference in the cleanliness is great. Avoid driving the sheep on the road (if possible) after they have been washed, and also avoid putting them in fields where there is bare earth, as it sullies the fleece. It is right to clip then any time after they become thoroughly dry, but I know a great many farmers say they clip so much better when the grease has risen a little. That may be so, but we don't make cloth out of grease yet. (Hear, hear, and laughter). Sheep should be shorn say seven days from the time of washing, and certainly not more than 10 days. A great injustice is often done to the buyer by sheep going too long between the two events, and some of the wool in consequence is little better than unwashed, and yet the farmer is prepareh to bring all his men to swear that every sheep was washed. That may be so, but when? If the sheep are housed the night before or just previous to clipping, the place they are in should be "bedded" with bean or pea- straw if either are available, because if some of it adheres to the wool it is conspicuous and easily removed. Failing these, use wheat straw which is preferable to oat straw, being stifer in the fibre. If the weather is fine and clipping is done out of doors, it is advisable to do it upon a stack-cloth —the practice of cutting the grass prior to clipping even if carefully swept afterwards is most reprehensible, because the dried grass becomes almost like threads, and it is impossible to remove it. Consequently it gets through the machine, and into the yarns and pieces causing endless trouble and expense. It is essential that the wool should be clipped in a dry condition, otherwise it takes serious harm. The "band" that goes round the fleece should always be

(Continued on page 562).

HORTICULTURE.

Dominion Fruit Growers' Conference.

The third Dominion Fruit Growers' conference was held in St. Patrick's Hall, in the City of Ottawa, on the 14th, 15th and 16th of February, 1912. In many respects, this national assembly of the Fruit Growers of Canada was a notable event.

Some of the notable personages who honored the convention with their presence and delivered brief addresses were His Excellency, The Governor-General, Rt. Hon. R. L. Borden, Premier of Canada, The Hon. Martin Burrell, Minister of Agriculture, Prof. James W. Robertson, Mr. Sydney Fisher, ex-Minister of Agriculture, and Sir James Grant.

Among the most important of the Resolutions passed by the convention was one dealing with the Standard Apple Box. In the preliminary discussion of this subject, one delegate from British Columbia rather astonished the convention by advocating the holding in abeyance of this question, notwithstanding the explicit and definite instructions of the British Columbia Fruit Growers by resolution passed in January, 1911, and reiterated in their convention of January, 1912, by unanimous vote. Another member of the British Columbia delegation damned the proposal with feint praise, but the balance of the contingent came to the rescue loyally and a resolution was finally passed in the following terms:

"Be it resolved, That this conference recommends for domestic trade, the legalization of the apple box at a capacity of 2,200 cubic inches, as nearly as possible measuring twenty by eleven by ten (20 x 11 x 10) inches inside; and be it further resolved, that this amendment come into force within two years."

Other resolutions of importance were as follows:

Whereas, the discussion has brought out considerable difference of opinion as to the most suitable shapes for the various box packages of fruit, be it resolved, that discussion on this subject be deferred in order to enable the various Fruit Growers' organizations to investigate thoroughly and report with recommendations to the next Dominion Fruit Conference; and be it further resolved, that the conference request the Dominion Department of Agriculture to organize the investigation. A resolution was carried recommending the legalization of the four-basket plum crate measuring $15\frac{3}{4}$ x $15\frac{3}{4}$ x $4\frac{1}{4}$ inches inside measurement.

Resolved, that we urge upon the Minister of Agriculture the greatest care in securing competent inspectors and to this end suggest that the advice of a commission of three fruit growers, or dealers, from each fruit growing Province would be of valuable assistance in securing suitable men for appointment as inspectors.

Resolved, that sufficient inspection at point of entry in connection with imported deciduous fruit be made so as to ensure it being marked under the conditions of the Inspection and Sales Act.

Resolved, that the Minister of Agriculture cause investigation to be made as to the possibility of giving the applicants on payment of a reasonable charge, a certificate of the results of any inspection made.

Resolved, that when an inspector has examined a closed package of fruit, it be stamped "Inspected by No. ....."

Resolved, that the Fruit Marks Act (the Inspection and Sales Act, Part IX.) be so amended as to make it compulsory to mark on the outside of the box the number of apples contained therein.

Resolved, that this conference recommend that the Department of Agriculture divide the Fruit Growing Provinces into suitable districts, with a permanent and capable fruit inspector and instructor, in each district, so as to insure to the greatest possible extent inspection at point of shipment.

A resolution was adopted recommending the formation of a National Fruit Growers' Association, and the secretaries of the various local associations were appointed to perfect the organization after a provisional constitution had been adopted by the convention.

Be it resolved, that in the opinion of this conference, one of the first duties of the directors of the National Fruit Growers' Association would be to appoint a transportation committee of three members to look after the interests of the fruit growers with railway companies, cars and other equipment for the proper carrying of fruit; and to prepare cases from time to time for submission to the railway commission.

Resolved, that this third conference of the Fruit Growers of Canada would suggest to the Honorable Minister of Agriculture for the Dominion, to keep in view the fact that the fruit interests of Canada are now of sufficient importance to warrant the placing of the Fruit Division of the Dominion Department of Agriculture on the same basis as that of the Seed and Dairy Branches, with a commissioner appointed in charge.

Resolved, that the Government have daily market prices cabled from their commercial agents in Europe, published in the daily papers in all Provinces of the Dominion during the shipping season.

Resolved, that the Dominion Department of Agriculture be asked to inquire into certain legislation as will permit of the formation of co-operative fruit associations in Canada on the same line as has been so successful in other countries.

One of the retrograde resolutions was the adoption of a second standard size of apple barrel, rendered necessary through the uncompromising attitude of the delegates from Ontario and Nova Scotia, viz.: the following:

Whereas, there are two sizes of apple barrels in general use in Canada, and whereas it would appear that uniformity would be more nearly obtained by the adoption of the specified standard sizes for use in Canada, be it

Resolved, that the conference recommends the Government to provide two standards, one the 96-quart barrel commonly used in Nova Scotia, and the other 112-quart barrel commonly used in Ontario, and that the department provide for the enforcement of the use, by all growers and dealers of one or the other of these standards, and that the manufacturer (of the barrel) be responsible.

Perhaps the most impractical resolution brought before the convention was one recommending the adoption of definite sizes of various kinds of apples, to form part of the definition of grades, and we believe that it will be in the best interests of those who think this would be an improvement to the regulations, if the Goverbment should move slowly in regard to fixing by law standards of sizes for certain grades, the resolution was as follows:

Resolved, that Section 321, Clauses 2 and 3 of the Inspection and Sales Act, be amended in such a way that the minimum size of apples packed in barrels be as follows:

For Fameuse, No. 1, two inches; Golden Russets and kindred sized varieties, two and three-eighths inches for No. 1 and two and one-eighth inches for No. 2.

For Baldwins, Spies, Greenings, Ribston Pippin and kindred sized varieties, two and one-half inches for No. 1 and two and one-quarter inches for No. 2.

For Kings, Blenheims, Orange, Wolf

Costs Less Than Best Shingles—Lasts Longer—Adds Fire Protection

These are the three BIG reasons that have led thousands of farmers and manufacturers, as well as the big railway systems, to use

NEPONSET PAROID ROOFING

It has stood the test of the hardest service in every climate for years. The Chicago and Northwestern Railroad laid NEPONSET Paroid on one of their train sheds seven years ago. Last summer when the shed was torn down the NEPONSET Paroid Roofing was found to be in so good condition that it was cut in strips and used to re-roof several suburban stations. Isn't that the kind of a roof you want for *your* farm buildings?

Send for Our Free Booklet on Roofing

It is filled with interesting facts about roofing that you should know. A postal will bring it.

NEPONSET **Proslate Roofing** makes a handsome reddish-brown roof for houses

"VANCO" Lime Sulphur Solution

will keep your fruit trees free of Scale, Parasites and Fungi.

It is strong, uniform, clear, efficient—the strongest perfect solution that can be made and far superior in every way to home-made mixtures.

The Canadian Government Bulletin proves this. Specific Gravity on every barrel, to protect you.

"VANCO" Arsenate of Lead

will destroy all leaf-eating insects — never burns — sticks longer. The largest order ever placed for Spray Chemicals by any Canadian Fruit Growing Company, was for "Vanco" Lead Arsenate.

"Vanco" Fertilizers—Muriate of Potash — Sulphate of Potash — Acid Phosphate—Nitrate of Soda. We are the only house in Canada selling straight fertilizing chemicals of guaranteed analysis.

Save Freight—by ordering Sprays and Fertilizers together and having us make one shipment of the lot.

Send for the "Vanco" Book—study it—and spray for fall profits.

THE POOR DYSPEPTIC

Suffers Untold Agony After Every Meal.

Nearly everything that enters a weak, dyspeptic stomach acts as an irritant; hence the difficulty of effecting a cure.

Burdock Blood Bitters will relieve all the distressing symptoms of dyspepsia and in a short time effect a cure.

Mrs. F. C. Gross, Berlin, Ont., writes: —"I have been troubled with my stomach for the last seven years and tried all kinds of medicine for it, but none of them ever cured me, for as soon as I would quit using any of them, the same old trouble would come back. Last fall I was advised to try Burdock Blood Bitters, which I did, and used four bottles, and now feel so strong I can do all my house work nicely and can eat almost anything without it affecting me in any way.

"Our boy is also using it; he always complained of pain in his stomach and all over, like rheumatism, and at the age of ten had to stay home from school. He hasn't quite used two bottles yet and is feeling good, can attend school regularly and eats heartily."

B.B.B. is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Ocean Limited Early on Route.

SUMMER TIME CHANGE ON INTERCOLONIAL RAILWAY JUNE 2.

The summer change of time on the Intercolonial Railway will go into effect on June 2nd, when the famous Ocean Limited will be placed on the route between Montreal, St. John, N. B. and Halifax, N. S. with connections for and from the Sydneys and Prince Edward Island in anticipation of an early rush of summer travel. The time schedule is expected to be practically the same as last year, which means that the "Limited" will leave Montreal at 7.30 p.m. reaching Levis at midnight, and giving through passengers the opportunity of seeing the famed Matapedia Valley during the earlier hours of the morning and a view of the Restigouche River and the blue waters of the Baie des Chaleurs. The beautiful valley of Wentworth, N. S. will be seen in the more mellowing light of early eventide, and the train will reach Truro at 8.00 o'clock connecting with the through night express for the Sydneys and arriving at Halifax at 10.00 p.m.

The Maritime Express under the summer schedule will leave Montreal at 8.15 a.m. and through passengers will have the daylight journey through Quebec, and a view of the majestic St. Lawrence as it widens in its course to the sea. Making connection at Moncton with morning ex, press for St. John the Maritime continuing eastward will reach Halifax at 13.30.

The Ocean Limited will leave Halifax westbound at 8.00 a.m. and the Maritime Express will leave as usual at 15.10 thus there will be a through week day service by two trains equal to the best on the continent.

River and kindred sized varieties, two and three-quarter inches for No. 1 and two and one-quarter inches for No. 2.

And that where a packer of apples in barrels desires to establish a higher minimum standard for a portion or all of his pack, he may do so by stamping or stencilling on the face end of the barrel the minimum diameter in inches and fractions thereof, and that the diameter so marked shall be the minimum standard of size for such barrel."

The above resolution is so involved and impractical that we have no hesitation in saying that it would not be in the best interests of the fruit industry to have it made law. There are certain portions of the fruit-growing areas of Canada where to speak of Kings, Blenheims and Wolf Rivers as kindred sized varieties would be to excite ridicule, and the impossibility of defining the size of all varieties is painfully evident.

One of the last and most important resolutions to receive the favorable consideration of the convention was that, recommending to the favorable consideration of the Dominion Government a grant of money toward the expenses of the next Canadian National Apple Show, which will probably be held in the City of Montreal about the first week of December in the present year. The resolution, which was carried unanimously, was

Resolved, that the Dominion Government be asked to appropriate $10,-00 (ten thousand dollars) towards the expense of the next Canadian Apple Show, provided that at least $20,000 (twenty thousand dollars) is offered in premiums by the promoters.—F. M.

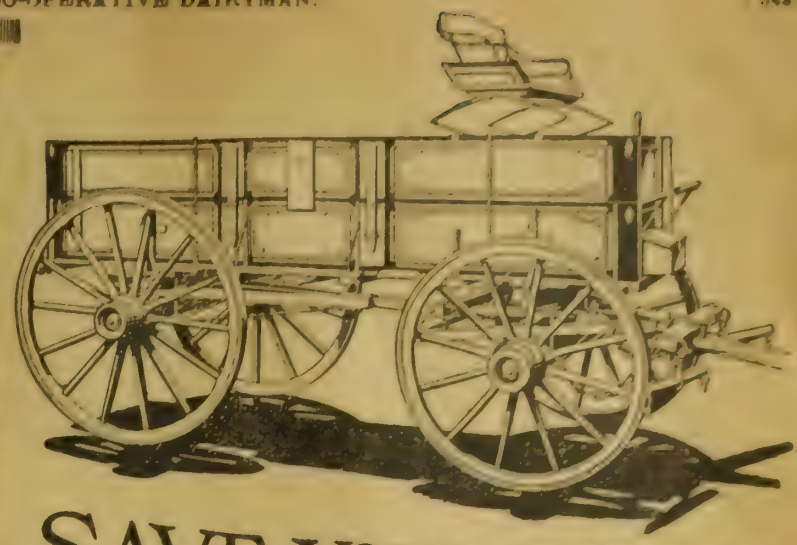
Cost of Spraying.

The cost of spraying four times during the season is about 20 cents per tree. That treatment increases the value of the fruit on the average not less than $1.50 per tree. Experiments have revealed that unsprayed apple trees yield from 10 to 50 per cent. of No. 1 quality fruit, according to the season, whereas sprayed apple trees yield from 80 to 90 per cent. of No. 1 quality. An instance is mentioned in which Mr. Medcalf, District Representative at Collingwood, Ont., took charge of a small orchard. It had never before yielded more than $50 per annum. He spent $50 on the orchard, gave it a good management, and within a year, the fruit brought to the owner $250. Another instance is that of Mr. Shearer, of Simcoe, Ont., whose two acres of orchard up to 1906 did bot yield more than $75 in any one year. He joined the local Co-operative Fruit Association. With the same number of trees, same area of land, and hardly any more expenditure of labor or money, he so improved his management that in 1910 the orchard brought him in $350, and in 1911, $432.20.

Garden Hints.

When there is danger of the frost biting the early vegetables, I take several thicknesses of newspaper and lay over the plants, and lay small clods on the paper to prevent the wind blowing the corners up. If beans are just coming through the ground, I turn two planks over them, fitting the top edges tight and propping securely. A better plan is to nail them together in a V shape, and turn the troughs upside down over the rows.

To transplant successfully the soil should be well moistened before the plants are pulled up, then with a round sharp stick make an opening in the ground, set the plant, partly cover the roots, add a bit of water and cover with fresh but not wet soil.—D. B. P.



SAVE YOUR HORSES

WHEN a wagon is designed for light draft, and the workmanship carries out that design, you have a wagon that is easy on horses. You need not be afraid to make your I H C wagon work. That's what it's built for. Loads and roads that make hard hauling are expected conditions for I H C wagons. I H C wagons have every advantage that first grade material and skilled labor can give them. They back up with actual results every claim we make for them. They haul heavy loads, with least strain on horses. Ask any farmer who has driven one of them. I H C wagons:

Old Dominion **Hamilton**
Chatham **Petrolia**

will do all the work you would ask of any wagon.

I H C wagon wheels—the foundation of wagon service—are built from selected, air-dried wood Hubs, spokes, felloes and rims are designed for strength and service, and the workmanship on them carries out the plans of the designer. Hubs are accurately bored and mortised. Boxes are forced to position in the hubs by hydraulic pressure. Therefore, they fit accurately, and, the skeins and skein boxes being paired, easy running is assured. The wheel has the proper amount of dish to make it as strong as a wheel can possibly be made.

The care and thought given to wheel construction and tire setting is evidence of equal thoroughness in the building of all parts of I H C wagons. Let the I H C local agent show you the extra value of other strong I H C points of construction. You can get literature and full information from him, or by writing the nearest branch house.

You can plant Potatoes as easily as you rake Hay—with This Machine.

It saves you all the back-breaking labor—the weary stooping—and the tiresome days of work. This machine—which is as easy to operate as a horse rake—enables you to plant from *four to six acres of Potatoes a day*

"O.K." Canadian Potato Planter

opens the trench, drops the seed, covers with moist soil, and marks for the next row—while you ride on the machine and drive the horses.

Not much work in this, is there? And there's money in Potatoes. The average price last years was 60c. a bushel—and in February this year Potatoes sold for $1.60 a bag in carload lots.

Get an "O.K. Canadian" Planter this year and plant more Potatoes.

"O.K. Canadian Potato Cutter" enables you to cut from 5 to 7 bushels of potatoes an hour. Beats hand-cutting, doesn't it?

"O.K. Canadian" Sprayer enables you to spray four rows of Potatoes at once. Another time saver.

Write for descriptive catalog H *and book "Money in Potatoes"*

We also make Cattle Stanchions, Sanitary Stalls and Water Bowls.

CANADIAN POTATO MACHINERY CO. LIMITED, GALT, Ont.

DAIRYING.

Breeding and Feedning Dairy Animals.

Mr. President and Members of the N. B. F. and D. A.:—

Your Secretary, Mr. Fawcett, asked me for a short paper on Breeding and Feeding Dairy Animals. I do not know why he omitted Weeding, as I consider that it is very important and believe not enough of it is practised. Perhaps he considers weeding has already been done.

I might say here if more farmers and dairymen kept a record of performance there would be more weeding done and as statistics show a decrease in dairy cattle it would still be greater and a benefit to the country.

BREEDING.

In Breeding some authority places the male 50 per cent. of the herd. In my opinion this is too great a percentage as the dam of the herd head should be greatly considered.

The head of the herd should have a broad and clearly defined forehead, with horns strong at base and set wide apart, the eyes large, full and bright. Jaws wide and strong, with muzzle, broad and nostrils large and open, which denotes good lung power, a good large mouth, denoting a good feeder. The shoulder strong, chest deep and low, fore legs well apart, short and straight.

Body: Back short, with straight top line and openly jointed, ribs broad, long, well sprung and wide apart, abdomen large and deep.

In hind quarters the thighs should be thin, long and wide apart, with rudimentaries of uniform size, squarely placed and wide apart.

The covering should be medium thickness, mellow and elastic, with soft and fine hair.

The weight governed by the breed.

The female should be along the same line of points as the male but of course of finer type and carrying an udder wide, deep, firmly attached to the body, well up behind and far forward with evenly placed teats of good size. The mammary veins, long and branching and entering large orifices.

FEEDING.

There is a wonderful difference in the amount of food required by different cows to produce the same amount of milk or butter, and a proposed ration given to suit one section of farmers or dairymen might be almost impossible for another section to follow.

Whatever should the proposed ration be, it should be palatable, nutritious and succulent.

In some sections , hay, (clover hay preferred), roots with more or less mill feed consisting of wheat, bran, middlings and cotton seed meal make up the stabling ration. The grain or mill feed should be governed by the production of the individual and length of period in milk; when an individual is loosing flesh, more concentrated food should be added and should she apparently forget the pail and remember her back the cotton seed meal should be lessened and more wheat bran added. Some are governed by a form of for every 3 or 4 lbs. of milk given one lb. of mill feed should be fed. In my experience no two individuals can be profitably fed the same ration. Too many milk records are rather misleading as they do not make mention of the cost of food consumed which is of great importance, especially when feed is quoted at the price of to-day.—Paper by J. F. Roach, Sussex, N. B., read at the recent N. B. F. and D. A., Fredericton, N. B.

The Gathered Cream System.

Under the heading "True Statement" the Chicago Dairy Produce writes: "Several years ago, when the whole milk creamery or the whole milk system was predominant, sour tainted, or unclean milk was generally, if not always, returned to the producer. A large percentage of the creamery butter was then of good quality and this had a stimulating effect on the demand. When a large number of whole milk creameries adopted the gathered cream system, a number of changes occurred and new methods and practices came into vogue. These resulted in a serious deterioration in the quality of the butter, which checked the demand."

Seldom does a heading answer more truly to the matter below it, and the editors and dairy-leaders who once boomed the system together with hand separator agents, have a heavy responsibility in having assisted in the unnatural reaction from the whole milk system which undoubtedly had been pushed too far in some districts, where the gathered cream system should have been maintained but changed from shallow pans and deep-setting to the hand separators.

Whenever sufficient milk—say about 10,000 lbs. per day—can be secured within a radius of some three or four miles, it would be well to change back accepting the lesson, needed by whole milk creameries, that a proper care of the skimmilk—pasteurization without dilution—is necessary to satisfy patrons.

In districts, where this cannot be done, the only remedy is to educate the patrons by quality payment to a better care of the cream and make the best of a bad job.

We cannot change human nature and of 100 patrons there is a large percentage who will not clean their separators or care for the cream, and the quicker we get the milk away from their control, the better it is.

Last Pound Skimmed As Well As First Pound

We will guarantee that you can take a "STANDARD" cream separator and skim to the full amount of its capacity, even if the milk is not at its natural heat, and that the last pound will be skimmed equally as well as the first ponnd. After the skimming is done, open up the

Standard

bowl and you'll find the inside edges of the discs are not clogged with cream, nor the outside edges stuffed with foreign matter. That is because there is ample space space between the discs and the bowl to provide room for more impurities than will accumulate in one hour's skimming. This is one of the greatest improvements in cream separators in recent years. It was suggested by Professor J. H. Grisdale, Director of Dominion Experimental Farms, Ottawa, and carried to completion by Standard experts. It means CLEAN CREAM, ALL THE CREAM, NO WASTE. Our booklet explains this feature and many others more fully. Drop a post card today for a copy.

Dairy Jottings.

Have a small pasture, or at least a grassy yard in which the calves may frolic. Such places should have shade and shelter of some description for the calves to run to during rains.

Allow them to come to the shed or stable during the spring rains or chilly nights, if they wish to. Some cows shed earlier or shed off all at once. Such will feel the spring chill much more than others.

Perhaps this should have been noted first: by all means go over the pasture to see if there is any barb wire loose, or any fence posts decayed so that a smart push would send it over; such a thing may cause serious damage through the cows getting out of bounds, or the loose wire may inflict serious injury.

The dairy cow must be provided with an abundance of feed to enable her to keep up her milk flow.

Have the milk for the calves sweet and of the same temperature as when it comes from the cow.

See that the salt supply is furnished constantly.

Know that they have all the drinkable water they want.

How Prize-Winning Herds Were Fed.

The method of feeding and management of three of the herds that won high places in the Dairy Herd competition, conducted by the Western Ontario Dairymen's association last year are given as follows by Farm and Dairy:

"My farm contains but 25 acres, 13 of which is in pasture, two in buildings and orchard, leaving 10 acres to grow fodder crops. We usually have two acres of corn, two acres of mangels, two or three of clover, and the balance in Hungarian grass. Most of the feed for our cows is run through the cutting box, clover, corn, and Hungarian grass being mixed together. All of this cut feed that the cows will eat up clean is given in the winter along with a few mangels. Occasionally a feed of long hay is given for a change. I find that Hungarian grass cut and cured at the proper time is one of the best feeds for milch cows. When the cows freshen in the spring, they are fed half a gallon of bran morning and evening all summer until mangels are fed again. The cows run on the highway in the daytime, for which privilege we pay $1.00 a week, and in the pasture at night. A pure-bred sire is used and heifer calves from the best cows are raised. Attention is paid to persistency in flow of milk rather than a large flow for the first few weeks. The milking is done in the stable all the year round, and care is taken that the cows are milked dry."—George Bourchier, Oxford County.

THE CASHIER SAID—"I notice your Butter Checks have been getting bigger lately. Did you buy another cow?".

THE FARMER SAID—"No, I'm using WINDSOR SALT. It makes better butter and I am getting better prices. It certainly does pay me to use Windsor Dairy Salt."

THE CASHIER SAID—"I should say it does. Do you mind if I let some of my friends in the secret?"

THE FARMER SAID—"Go ahead. Tell them all to use WINDSOR DAIRY SALT if they want to get the 'top' price for their butter" 67D

AMERICAN SEPARATOR

THIS OFFER IS NO CATCH. It is a solid proposition to send, **on trial, fully guaranteed,** a new, well made, easy running separator for $15.95. Skims hot or cold milk; making heavy or light cream. Designed especially for **small dairies, hotels** and **private families.** Different from this picture, which illustrates our large capacity machines. The bowl is a sanitary marvel, easily cleaned. Shipments made promptly from **WINNIPEG, MAN., TORONTO, ONT., and ST. JOHN, N. B.** Whether your dairy is large or small, write us and obtain our handsome free catalog. Address:

AMERICAN SEPARATOR CO. Box 1212 BAINBRIDGE, N.Y.

Don't be surprised if you have an attack of rheumatism this spring. Just rub the affected parts freely with Chamberlain's Liniment and it will soon disappear. Sold by all Dealers.

"The foundation af my herd consisted of grade Durhams selected for milking qualities. A pure-bred Holstein sire was used and his heifer calves form the present herd. About a week before the cows freshen, I start to feed a few mangels, three pints chopped oats, and a little flaxseed meal in addition to the rough feed. A little oat chop is fed all summer. When pasture becomes short sweet corn is fed twice a day. When the cornstalks become too ripe, mangels and a little flaxseed meal are given until the factory closes. In the six months last season, 5,051 pounds of chop were fed to the cows which is scarcely two and three-quarter pounds a cowper day. All the feed was raised on the farm."—John Van Slyke, Elgin County.

"In the winter we feed corn fodder, hay and about two quarts of oat chop a day to our dairy cows. When the cows freshen a small amount of oil-cake, bran and oat chop mixed with sugar beets is fed. When the pasture is good, oil-cake and bran are fed once a day. About the first of July, we start soiling on green peas and oats, followed by green corn and roots. Late in the fall shorts, bran and alfalfa hay twice a day are also given. Our cows are Holstein grades."—Seymour Cuthbert, Oxford County, Ont.

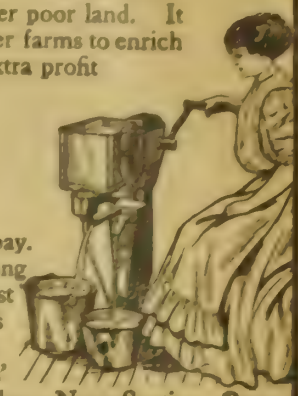
—N. Y. Produce Review.

Making an Extra Profit

Like other keen farmers, you are after extra profits. Rich land pays you an extra profit over poor land. It pays well to keep cows on wheat, fruit and other farms to enrich the land. High-producing cows pay you an extra profit over average cows—and the high-producing

SHARPLES
Tubular Cream Separator



will pay an extra profit no other separator can pay. This is because Tubulars have twice the skimming force, skim twice as clean and produce the finest velvety cream. This extra Tubular profit appeals strongly to shrewd dairymen and business men. One instance, out of many, is the Free Masons' Home shown above, which is located at Windsor, Nova Scotia. Reverend J. B. Merrill, superintendent of the home, while treasurer of a well-known creamery, discarded a disk machine for the Tubular. The simple, sanitary Sharples Dairy Tubular, which contains no disks, is the machine which does the work for this well-known home and its guests.

Remember that the oldest separator concern on this continent positively guarantees Tubulars forever. Write at once for Catalog 194 and learn about the extra TUBULAR profits.

LIVE STOCK.

Suffolk Sheep.

Natural hardiness and vigour of constitution, a great capacity for productiveness and early maturity and an unequalled record as mutton producers is a combination of properties so valuable and desirable, that, could it but be realised that such are beyond doubt and in a remarkable degree characteristics of the Suffolk Sheep, few would be slow to test the merits of that breed.

In the endeavour to show that this statement is not merely theoretical, but founded on actual fact, this article purposes dealing rather with facts and statistics relating to the qualities and uses of the breed than with details of its history which are so fully dealt with in the pamphlets issued by the Suffolk Sheep Society, and which receive special attention this year in a signed article in the current issue of the Royal Agricultural Society's Journal.

Recognised as a pure breed since 1810, the Suffolk was founded by crossing horned Norfolk ewes with improved Southdown rams, its origin being probably the result of an accident, for in the "Annals of Agriculture" (Vol: VI. 1786 A.D.) it is related by Arthur Young, the well-known Agriculturist, that a Southdown ram given him by Lord Sheffield got by accident among a little flock of Norfolk ewes belonging to a tenant who, as the result, had seven or eight lambs of an entirely different breed from all the rest. Early the following summer (1784) his lambs were drawn fat by the butcher who, when he came to make choice, drew every one sired by the Southdown before he took a single Norfolk, declaring at the same time that they were much the fattest of the flock. The farmer applied immediately to Mr. Young to save him a ram lamb for future experiment and during the early part of the next century there is ample evidence that the interbreeding of Norfolk ewes with Southdown rams was very general. By the middle of the century the breed was koown as "Blackfaced", and in 1859 was christened "Suffolk" and a separate classification provided for it at the Suffolk County Show.

The old Norfolk breed has now practically disappeared but in the Suffolk of to-day all its best qualities are retained—a hardy vigorous constitution, high breeding quality and fecundity, the black face and legs, bright eyes, quick movement and graceful carriage of the head, all denote the ancestor so often described as "deer-like", while from the more kindly natured Southdown come the breadth of carcass, the wide loin, the deep rib and good leg of mutton; these good carcass points, combined as they are with the fine flavour and juicy lean flesh of the Norfolk mutton, yield a meat capable of satisfying the most fastidious. A tendency to horns, due to the Norfolk progenitor, was overcome by selection in the course of a few years, nevertheless "Spud horns" will still occasionally crop out, but male sheep showing these small horns are to be avoided for pure breeding purposes. The Norfolk as well as the Southdown, was a short-woolled breed noted for the fineness and whiteness of its fleece. Arthur Young writing in 1804 speaks of the fleece of the Norfolk as "third in the kingdom for fineness."

Independent testimony of the progress of the Suffolk breed is found in 1886 when Mr. W. J. Moscrop, a Yorkshire Agriculturist, acting as judge of farms in Norfolk and Suffolk, reports thus in the Royal Agricultural Society's Journal (Vol. XXII 2nd Series):—"In the breed of sheep within the present century there have been greater changes even than in the cattle," and goes on to say that the result of crossing the old Norfolk breed with the Southdown was the creation of a new breed possessing the good qualities of both. The breed is now known as the Suffolk. The mutton is reported to be worth fully a penny (2 cents) more per lb. than that from the long-wool cross, and so famous has it become that gentlemen of the turf frequenting Newmarket and tasting it there are having it sent to their London houses. They are also very prolific breeders and excellent milkers and are much in demand for crossing purposes."

Not only were the good qualities of the two breeds combined, but in point of fecundity the capabilities of the Suffolk have been highly developed. For many years the Suffolk County Agricultural Association has held competitions with a view to encouraging fecundity among flocks and rewarding successful shepherds. The following figures represent the result of these competitions for the past ten years and it should be remembered that they are (1) accurate data, not the result of guess-work, and (2) the results represent lambs reared to May 1st, not offspring born.

Date	Tatal No. Suffolk ewes from registered flocks, in the competition.	Average No. of lambs weaned from each 100 ewes
1901	2,146	150.56
1902	3,076	151.27
1903	5,452	158.49
1904	2,959	158.06
1905	3,967	153.34
1906	2,676	150.60
1907	4,903	154.15
1908	5,474	149.91
1909	6,681	153.67
1910	5,459	145.58

In the same competition the record of losses among the ewes from time of turning in the rams until weaning is practically 2.5 per 100 ewes mated. These figures clearly demonstrate the excellence of Suffolks as nurses and the stamina shown by them when producing their young.

In East and North-West Suffolk are large tracts of heath-land, and, on these, Suffolk ewe-flocks spend a great part of the day, and for many months in the year get a large part of their living off land where no other animal but hares or rabbits could exist. It is a great merit of the ewes that while they have the power of earning a living on a wide range of poor pasture out of the breeding season or when not far advanced in pregnancy, they are also capable of converting a large amount of food into milk when rearing their lambs.

Those unfamiliar with the breed have been known to imagine that the Suffolk is a big eater and slow feeder. This may be emphatically denied. No animal will mature very quickly unless he is a pretty large consumer and the Suffolk, though a hearty feeder, is a kindly doer, and, while he wants plenty of good food, does not require a constant daily change of food to stimulate his appetite. And there is ample evidence of his capacity for early maturity. Ram lambs are so forward at from 7 to 8 months that they are largely used for breeding purposes. It is, in fact, the exception to find untried Shearling rams offered for sale, practically all being sold as lambs and used the same season. A well grown male of 8 months is usually mated with 40 ewes and with most successful results. Well grazed wethers brought to market at 9 months old yield from 70 to 90 lb. carcass weight and cut up full of lean meat. The average live weight of Suffolk Lambs exhibited in the Live Section at the Smithfield Club Show for the past five years is as follows:—

WETHER LAMBS

(under 12 months old).

Date	Average Weight (Pen of Three)	Average Weight (Per Lamb)
1906	562. lb.	187.3 lb.
1907	617. lb.	205.6 lb.
1908	637. lb.	212.2 lb.
1909	622. lb.	207.3 lb.
1910	615. lb.	205.0 lb.
Average	610.6 lb.	203.5 lb.

And, in 1910, competing with representatives of every breed, a pen of three Suffolk lambs, 9 months 3 weeks old, weighing 651 lb. was awarded the Prince of Wales Champion Cup for the Best Pen of Sheep or Lambs in the Show.

Statistics published in connection with the Carcass competitions at the same Show, give equally good results with regard to the percentage of dressed carcass yielded by Suffolks. The following are the averages for the past five years:—

YOUR VITALITY CAN BE RESTORED

Strong, vital, healthy manhood fascinates all who come within its influence. As true as you are a living, breathing human being, I can restore your VITAL strength; there is not a shadow of a doubt as to what I can thus do. BUT there is a single condition, one restriction I put, a certain solemn promise I exact from you before you can exact a promise from me; namely: you must unconditionally agree now at once and forever to discontinue all dissipation; with this out of the way I will do the rest. Remember what I say; no matter what your present condition; no matter what has happened in the past, just forget it and put yourself in my hands; everything will come out as you wish it. I use no drugs, no lotions, no medicines; I place no foolish restrictions upon you; just lead a natural life, get all the enjoyment you possibly can, but cease dissipation; always remember that. I can then restore your vital energy: I can take you out of the half-man class and put you in the spotlight of full, healthy, contented vigor; I can make you feel young again and keep you feeling young to a ripe old age, because I drive into your system the one thing which keeps the whole organism in balance, namely, VITALITY. My HEALTH BELT with suspensory attachment is the greatest single self-treatment remedy or VITALITY RESTORATIVE that the world has ever known, or probably ever will know. It is worn comfortably about the waist all night and every night for two or three months. Thus while you are sleeping it sends a great, soft, potent, life-giving current of VITAL FORCE into your blood, your nerves and your organs. There is not a moment's wait. It helps you immediately; it commences from the first time worn, to show you the sunshine of new energy; it takes the kink out of your back in one night; it makes a man of you after you have given up in despair, simply because it supplies you with VITAL POWER—which means health. Just stop to think. You have the same organs, nerves and fibre, the same make-up exactly that healthy, vigorous men possess, the only difference being you are under tone; you need a foundation of NEW VITAL RESERVE, and it is this I give you. There is no reason why you should not be as strong, healthy and vigorous as the best fullest-blooded man of your acquaintance. The matter is easy if you do your part. Never mind about buying a HEALTH BELT as yet; first get in communication with me; read over my booklet, and if you want to do so tell me your physical ailments that I may advise you; then a little later we can arrange in some way for you to try my HEALTH BELT. But first fill in the coupon and get the book free, or call at my office. My HEALTH BELT also cures Rheumatism, Kidney, Liver and Stomach disorders.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing oa strong. Write or call to-day. Hours, 9 to 6.

DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs:—Please forward me your Book, as advertised, free, sealed

MOTHERS' CORDIAL OR HERBAL TONIC 15

Is nature's own food. It contains no drugs or stimulants. This wonderful Tonic is simply a scientific blend of Indian herbs—it strengthens the nerves and muscles—puts the expectant mother in prime condition, making childbirth safe and easy

Mothers' Cordial or Herbal Tonic, besides being a blessing to expectant mothers, is also a powerful tonic for all women in a run-down condition. It builds up the internal organs, strengthens and purifies the blood, effecting a clear, beautiful complexion. This Cordial is an excellent remedy for painful menstruation—an especial benefit to those approaching the change of life.

Write for interesting circular FREE.

A package of Mothers' Cordial or Herbal Tonic lasts a month. Full directions inclosed. At druggists or by mail, postpaid $1.00, 6 packages $5.00. Dr. Cooniey Medical Co., Windsor, Ont

The All Canadian Route to Montreal.

Via the Intercolonial Railway Maritime Express is the only All Canadian Route to Quebec and Montreal from the Maritime Provinces. The Maritime Express is generally admitted by experienced travellers to be the most comfortable train in America. This is especially true in regard to the dining and sleeping car service. The diners of the I. C. R. are roomy and well ventilated and furnished in the best of taste. The excellent meals are served Table d'hote at a price away below the a la carte rates prevailing on the company owned lines. The sleeping coaches are up to date in every particular, and the smoothness of the road bed makes the long journey easy and pleasant. Being popular with a class of travellers who are generally found to be the acme of good company the through journey is never found dull, and even during the winter months there is much of scenic interest in the day's ride through the Province of Quebec. Montreal is reached at the convenient hour of 6.30 p.m. and connections are made at Bonaveoture Union Station with the through trains of the Grand Trunk Railway for Toronto, Buffalo, Detroit, Chicago, and other points in Western Canada and the United States.

No better test can be required of the merits of a sheep for mutton production than this "block test" at the Smithfield Show. The numerous entries in Longwool, Shortwool and Cross-bred Classes each year point to the anxiety of each breed to claim distinction. One of the two judges is invariably a meat salesman of repute and the following list of awards won by Suffolks and Suffolk Crosses convincingly proves them to be mutton producers of the highest quality.

Class for Wether Lambs of any shortwool breed—First prize to Suffolk ten years running, i.e. from 1900-1909 inclusive.

Class for Wether Sheep (under 24 months old) of any shortwool breed—First prize to Suffolks from 1900-1904 inclusive, and again in 1907 and 1909.

Class for Wether Lambs of any Cross-Breed—First prize to Suffolk-Crosses from 1902-1905 inclusive and again in 1908 and 1910.

Class for Wether Sheep (under 24 months old) of any Cross-breed—First prize to Suffolk-Crosses 1901, 1903 and from 1905-1909 inclusive.

Champion prize (Best Carcass in the Yard) for which all pure breeds and Cross breeds compete, awarded to Suffolks from 1902-1906 inclusive and again in 1908.

Besides nearly one-half the total other awards in the Short-wool and Cross-bred classes. The carcass in well-proportioned so that the best joints are prevalent, and the large proportion of lean meat and saleableness of all joints have won the universal admiration of the London meat traders.

Apart from the value of the "Clip," wool has an important bearing upon the constitution of the animal and upon the quality of its flesh, and Suffolk breeders have always endeavoured to maintain a close fleece with medium length of staple. The wool is fine in texture and well covers the whole body, with the exception of the head and legs below the knee, which should be quite bare of wool and covered with fine glossy jet black hair (the only exception allowed being a small tuft of white wool on the forehead). The average weight of fleece (first year's clip), on good soils, is about 8 lb. per head of washed wool. Ewes will clip from 5 to 7 lb. and rams up to 14 lb. (washed).

For crossing purposes, the strength of constitution, activity and prepotency of the Suffolk ram render him a most valuable mate and particularly with the long-woolled breeds. The cross so obtained is not only an animal yielding a heavy fleece of good wool but also a very superior carcass of meat, Ample evidence is afforded on this point by the remarkable success of Suffolk Crosses, as already stated in the Carcass competitions at Smithfield, while on four occasions (the only times that the chief award has gone to lambs) Suffolk-Crosses have won the Championship at the Scottish National Fat Stock Show. In 1910 the champion pen consisted of three Suffolk-Border Leicester Lambs, 8 months 3 weeks old, scaling 675 lbs. The same pen also won the Championship for Cross-breeds at Smithfield. The Suffolk-Cheviot cross is an excellent one and prominent among the Smithfield winners. The Suffolk-Southdown cross also makes a nice compact sheep, a great favorite with butchers. A flock of mongrel ewes and their produce crossed through several generations by Suffolk rams get type, fecundity, and good milking qualities. Interesting statistics have been preserved of an experiment car-

(Continued on page 562).

Let Your Next Binder be a Deering

THE Deering name has always stood for progress. The Deerings bought the patents of the first knotter. A Deering tag was on the first sisal twine, and the first company to grow dissatisfied with the steel it purchased, and built its own rolling mills was the Deering. It was this spirit of leadership which led them to make the Deering New Ideal binder to meet the demands of farmers in Eastern Canadian provinces.

These machines are made in Hamilton, Ontario, by Canadian workmen for Canadian harvest work. Ask the Deering agent to show you these points on Deering binders: The main frame made of high carbon steel bars, hot-riveted together, forming a unit which the hardest usage cannot twist out of shape; ball and roller bearings to make the machine light running; equipment for the use of either a smooth section or serrated knife, and, last but not least, the venerable Deering knotter, simple, accurate, unfailing.

The Deering line is complete and of the same quality, whether binders, twine, mowers, rakes, tedders, or hay loaders. See the I H C local agent and make an inspection yourself, or, write the nearest branch house for a catalogue.

FREE—MAGNIFICENT PHONOGRAPH—FREE

Here is the most stupendous offer ever made by any reliable firm. We will give away absolutely without one cent of cost, 1,000 of these magnificent Phonographs, or Talking Machines, complete with your choice out of hundreds of the newest and most popular records.

This is the chance of a lifetime **An absolutely honest offer**

These grand phonographs are not toys, but genuine talking machines manufactured and guaranteed by one of the largest European makers of high grade Phonographs. It talks, sings, plays orchestra music, tells funny stories, and, in fact, **can do everything you would expect of a $50 machine**. It uses a regular cylinder record, of which we send you a large list to choose from. It winds up and is run by a regular clockwork motor, has a special governor to regulate and control speed, nickel plated sound producer fitted with perpetual needle. It is so entirely simple and easy to operate that any child can run it. It is full size, newest Lyra shape, beautifully enamelled and finished throughout, and fitted with a bright metal horn. You can put music, entertainment and constant pleasure for everybody into your home and you don't need to throw away your money by paying $35.00 to $50.00 for a talking machine, because you can get this one absolutely **FREE** for only a few minutes easy work.

Now all we ask you to do is to just send us your name and address, and let us send you, postage paid, and without one cent in advance, only 8 boxes of the famous Dr Edson's Lax Liver Tonic Blood Purifier and Nerve Pills to distribute among your friends at our special introduction offer of only 25c a box. These are the greatest remedy on earth for weak and impure conditions of the blood, nervousness, stomach and kidney trouble, and a great Tonic and Life Builder. With them we will send you absolutely free Dr Edson's Harmless Headache Tablets and 3 boxes of Edson's Little Wonder Stomach and Liver Pills, making a total of only 14 boxes in all, and you will sell them all in a few minutes because every purchaser of a single box of these famous remedies can receive free from us a grand present of Elgin watch, chain, locket or ring. When you have sold the 14 boxes return us the money, only $3.50, and we will immediately send one record of your choice, together with an opportunity to get dozens of new records free, without further orders to you at once.

REMEMBER. We are bound to secure a national distribution for these grand remedies, no matter how much it costs us, and when we say we will give you this grand phonograph outright for selling the 14 boxes at 25c., we will do so. Do not miss this wonderful opportunity, but write to day to

INTERNATIONAL MANUFACTURING CO. DEPT. P202 TORONTO, ONT

THE HORSE.

Filing the Horses Teeth.

Any farmer of good judgment can be taught to float the sharp points off horses' teeth, but any of us can be shown in a few minutes how to accomplish something that we could not learn in days from what any man may write on the subject. Of course, horse dentistry cannot be taught in a few minutes, but the floating off the sharp points of a horse's teeth can be taught in a few minutes. The first lesson that needs teaching is that the upper jaw of a horse is much wider than the lower jaw, and when the mouth is closed the teeth do not set squarely together. The teeth on the lower jaw set only on the inner part of the teeth of the upper jaw. Lesson No. 2 is that when a horse masticates his food he doesn't do it by simply shutting his teeth down on the food. He gets the mouthful of food on his tongue, which he uses to carry the food between the teeth, and the lower jaw works sideways enough to grind the lower teeth on the upper teeth. Now, if he carried this sideways motion so far as to go clear across the teeth on the upper jaw there would be an even wearing of the teeth, but as a rule he does not.

Consequently the inner part of the teeth on the upper jaw is worn off, and the outer part of the teeth on the lower jaw. Thus it is that a saw of sharp points is formed on the outer edge of the teeth on the upper jaw, and a similar ridge of points on the inner edge of the teeth on the lower jaw. In time, as the wearing goes on, these points wound the cheek or the tongue of the horse so that he cannot make the lateral motion of the lower teeth on the upper teeth, as the ridge prevents it; also he cannot use his tongue as he would or should in carrying the food between the teeth. Now, all that needs to be done is to float off these points. Never allow the rasp to touch the main crown of the teeth. In case this is done, then the enamel of the tooth is removed, and the tooth soon decays; the nerve of the tooth is exposed, and the horse can never again chew his food without pain. Ignorant men think the teeth need filing down with the tooth rasp, when they need no such thing at all. It is the striking of the points named that makes the grating noise sometimes noticed and not that the front teeth are so long the grinders (molar teeth) cannot come together. The front teeth never need dressing. They are used only to pull hay out of the rack or nip off grass; and they never get long, as many suppose. The gums, as the horse grows older, settle away from them and make them appear to grow longer than they formerly were. This is all the secret there is about the filing of the horse's teeth. Use care to file off only the sharp points, then stop as soon as the points or ridges are filed off.

A twist is always needed to be put on the nose, and the tongue carefully pulled to one side by an assistant, so it may not be in the way of the one filing the teeth. Ignorance of what is needed spoils many a horse's mouth. It is seldom that all that is necessary to do cannot be done in ten minutes, and many times five minutes is enough when the rasp is a good one and the man who uses it understands his business. Ignorant men always try to do too much and make a great spread over a simple matter. It is more in the know how than in doing the needed work.—Dr. Smead, in Tribune Farmer.

Barley for Horses.

In the feeding of horses the object aimed at, so far as the commercial animal is concerned, is to obtain the maximum amount of energy, or work, at the lowest cost, but it is necessary to look a little beyond this. Economy does not necessarily mean the use of the cheapest or, rather, the lowest in price, or even the home utilisation of the saleable, for there may be circumstances under which the cheapest is not the best. This is the case with barley. In many countries, and especially in the East, barley is still the staple feeding grain for horses, and old Youatt tells us that until the introduction of the oat it seems to have constituted the only grain food of the horse, but this does not make it suitable for English horses, for which both experiment and experience has demonstrated oats to be a long way the best all-round grain.

NOT TO BE RECOMMENDED.

On paper barley is a better food than oats; it contains more albuminoids and carbo-hydrates, but is less digestible, and in this connection Youatt says:—"There seems however, to be something necessary besides a great proportion of nutritive matter in order to render any substance wholesome, strengthening, or fattening; therefore, it is that, in many horses that are hardly worked, and, indeed, in horses generally, barley does not agree with them so well as oats. They are occasionally subject to inflammatory complaints, and particularly to surfeit." Good barley is not a cheap food, it always commands a higher price than oats in the market, but it is when it is inferior, and in a sense unsaleable, that it is apt to be provided for the team. As part of a mixture, and given crushed, it is less objectionable, and may be economical, but if given uncrushed, or without any preparation —some boil qarley—a large amount of the grain passes out of the body with the foeces, having escaped digestion. The grain is very hard. It is frequently pointed out that horses are fond of it, and alleged that the trouble which admittedly often follows its use is due to the excessive quantity eaten, there having been a departure from the golden rule that no grain to which an animal is not accustomed should at first be given in anything but small quantities. This probably largely explains the success with which barley is used in other countries, but English horses are not accustomed to it, and while they are becoming accustomed, by its gradual introduction into the diet, something commonly happens, and loss of service—perhaps loss of a horse—and a veterinary surgeon's account must be added to the cost of food.

UNSALEABLE BARLEY.

A farmer who has unsaleable barley may use it for feeding his horses, and by using it in small quantities and increasing it gradually, may, perhaps, do so with safety; but, as a rule, the team of the man who goes in for feeding damaged or unsaleable stuff to his horses is not a source of pride

Horsemen Attention ! !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevets the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunche sof all kinds.

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR :—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

We Call Your Kind Attention to These Facts :

That it is unreasonable to think a horse can work, and do his best in an ill-fitting collar, that is continually galling his shoulder or hauling up on his neck and choking him. It is also inhuman to expect a horse to work under such circumstances when this can be avoided by using the **Currie Collar,** a collar manufactured right in our own Maritime Provinces that is acknowledged, by experts and competitors alike, to be the best collar on the Canadian market. We make this collar in all styles, from heavy draft to the best patent leather and kay collars. Inquire for this collar where you buy your supplies. If they do not stock it, send to.

WHY HE WAS LATE.

"What made you so late?"

"I met Smithson."

"Well, that is no reason why you should be an hour late getting home to supper."

"I know, but I asked him how he was feeling, and he insisted on telling me about his stomach trouble."

"Did you tell him to take Chamberlain's Tablets?"

"Sure, that is what he needs."
Sold by all Dealers.

to his carter. Further, the farmer has generally about him other animals—cattle, sheep, pigs, and poultry—that can make much better use of inferior samples of barley than horses. The very fact that the grain is in some way so damaged or inferior as to make it unsaleable for the purposes for which it is usually marketed is against its being suitable for horses, who can never be economically fed on damaged grain. Even if barley can be demonstrated in every way suitable as a grain food for horses, and they are accustomed to it by its gradual introduction, it would never pay the horse owner who is not a corn grower to buy such barley as would be in a fit condition for horse feeding.—Pateley Bridge.

Lumps on Horse's Shoulders.

Constant Reader:—Being a constant reader of your valuable paper, and having gained much useful information from it, I would be much obliged to you if you could give me some little help in regard to my horse's shoulders. On two or three different occasions during the wet weather, after having done a full day in the collar in the wind and rain, on going to feed and harness up for a start the next day I have found a lump about the size of an egg on the horse's shoulder. I have eased tne collar, and on the last occasion the collar was not touching the place when he was in draught.

The lump or swelling complained of is due to effusion of serum or lymph, or both, produced by inflammation, and is not uncommonly met with in horses that are naturally tender skinned. With reference to the statement that you have eased the collar, and on the last occasion the collar was not touching the place when he was in draught, you are probably mistaken. It is not stated in what way the collar was "eased," but it is a most difficult matter, whether by "chambering" or pads to keep the collar off the damaged surface—that is, to remove all the pressure—without causing it some where else when the draught comes on it, although the collar may look to clear the injured part when it simply rests on the shoulders. Some horses are so defective in conformation about the neck and shoulders that they are entirely unsuited for harness work, and such animals are fitted and kept going only with the greatest difficulty. This cause of constant injury and soreness is often overlooked, and the trouble attributed to an excessive tenderness of the skin, which, though it is a frequent cause of trouble, is by no means the only cause. What will have happened by the time you see this reply we cannot predict, as much will depend on the management, but on the first occurrence of such injury, the best plan is to throw the animal out of work for a few days and use an astringent or "hardening" lotion. An example is powdered alum 1 oz., sulphuric acid 1 drachm, water one quart. When the horse comes in from work remove the hames, lift the collar from the shoulder to let the air under, and then allow it to fall back into position and remain on until the shoulders are quite dry and cool. A similar plan is practised with some success in hunting stables for the prevention of sore backs. After taking the collar off, give the skin a thorough wetting with the astringent lotion, and allow it to dry on. Care must be taken that the collar fits properly (old collars often get out of shape, and need to be "re-plugged" and re-lined), and that the lining is clean and dry. In prolonged wet weather, and often in muggy weather, it is impossible to get the lining dry without artificial heat, and it should be stood before the harness-room or kitchen fire.

INTERNATIONAL
3 FEEDS FOR ONE CENT
WE POSITIVELY GUARANTEE
that a 25-pound pail of
INTERNATIONAL STOCK FOOD
will save you $7.00 worth of Corn or Oats
Because it promotes digestion and assimilation and enables you to cut down the grain ration 15% to 25% and still get better results. The saving of grain represents a saving of good hard cash to you.
WE WANT YOU TO FEED 100 LBS. AT OUR RISK

¶ It will not cost you a cent if you are not satisfied. See our dealer in your town or write us for particulars. Mention this paper and the stock you own and we will send you a litho, size 16 x 22, of our three champion stallions.

Read what James L. Hill, of Fredericton Junction, P.E.I., wrote us on February 15th:

I think International Stock Food is a great thing for stock. We wouldn't be without it for anything. It keeps our horses in fine condition; in fact, every person admires them, they have such a glossy skin and always look well. We give it to young calves and pigs and find it agrees with them splendidly, and the Poultry Food shows itself in a very short time. Our hens have been laying most of the winter. I cannot say too much for your food for all kinds of animals.

INTERNATIONAL STOCK FOOD CO., Limited - - - TORONTO

The "Bissell" All-Steel Rollers

The "Bissell" Roller is all steel except the Pole. It is braced and stayed to stand all kinds of hard work and wear well. The bottom of the frame is all steel too.

The end frame Hangers are formed from bar steel and there is no twisting or warping on "Bissell" Roller frames.

The (18) anti-friction Roller Bearings make light draught.

The Draw Bracket and low hitch does away with neck weight.

The Axle revolves with the drums and there is no squeaking or grinding.

The Cages holding the anti-friction rollers are the best yet; they're MADE OF MALLEABLE ALL IN ONE PIECE—no twisting or binding of the bearings on the axle of the "Bissell" Roller. The Seat Spring is reinforced and is DOUBLED AT THE HEEL.

These good features are not all of the advantages of the "Bissell" Roller. Many more good points are built into them, making a Land Roller that is 'built for business," that stands up, against lots of hard work.

POULTRY.

The Incubator on the Farm.

It should be the policy of every farmer to provide some permanent improvement every season. One year it may be a building, another year some rather extensive fencing, at another time some implement that will prove of value in carrying on the farm work. One of the first of these improvements if it has not already been made, should be an artificial method of hatching chicks. The incubator is a necessity even if only a few chicks are to be hatched. Those who have had experience with the natural method of hatching, realize the changeable nature of a hen's disposition. One day she may be thoroughly broody and the next she may be flitting around the yard with never a thought of her maternal duties. Unfortunate indeed is the case when this light hearted disregard of the responsibilities of hatching comes at a critical time in the process of incubation. The incubator may not be a cure all for every problem in poultry raising, but it is most certainly a great boon to the farmer or even the city poultryman who wishes early birds and who would bring out his chicks at a time to secure the best growth before the cold weather. There are many reasons why the farmer should use the incubator. They may be summed up under three principal heads. First, the incubator is absolutely dependable and its disposition is neither fickle nor erratic. In the second place with the incubator one has definite control of the times and seasons for hatching. In the third place, the incubator chick does not come into this world hampered by lice or vermin transmitted from the plumage of the mother hen. These three factors should be sufficient to influence anyone in favor of artificial hatching. But after the hatching is over the artificial systems of brooding are also a welcome change from the older method. With all the chicks of uniform size and all in a single flock, it is much easier to care for them and leed them so as to get the most rapid growth. They can be handled with greater economy of feed and the results will be better and more profitable all along the line.

When it comes to a matter of sentiment the incubator is pretty nearly as faithful as the old hen and the man who refuses to use one because he likes to see the hen mother her chicks, is foolish in the extreme.

It never pays to feed ducks and chickens together in the same place, as a duck will pick up a half dozen grains while a chicken is getting one. Ducks are such stuffers that we often wonder how they get along from dark until daylight without getting a midnight meal. They will do well without much change of feed as all they want is enough of it.

Setting the Old Hen.

The motherly instinct which our great Creator in His wisdom has implanted in the breasts of all female creatures is especially strong in our humble friend, the hen. In some breeds this maternal instinct is much stronger than in others, and, run to excess, it becomes a nuisance, and interferes with the laying qualities.

We will step into our neighbors' yard and see how this is managed by different people. "Maria," calls the head of the family, "Old Speckle wants to set; have you any good eggs to put under her?" "Yes," answers Maria, "I have those expensive ones I bought from that crack breeder we went to see the other day." "Well, let's fix her up right away, for I am in a hurry with other work, and can't stop long to fool with an old setting hen this morning."

Maria gets her fancy eggs ready and sallies forth into the yard to find a box fit for a nest, husband suggesting that "Any old thing is good enough to set a hen in. Why," he enlarges, "my mother never made a fuss about setting a hen at all, just let her set where she pleased, out in the barn, under a fence or wherever she wanted to, and she always had swads of chickens. "Things were different on a big farm, from what they are on this small place," answers Maria, and at last she sees an old box, used for years and carelessly set away with the old straw still in it. "This might do if cleaned out well," she ventures, and her husband takes it in hand, looks it over and pronounces it all right as it is. "O, but the old straw won't do," says his wife, and after a little grumbling the old straw is carelessly turned out, to be blown at will, and the box shaken out a little and a cursory examination made for lice or mites, "although," Mr. Man says, "there is little danger of any living so long. The box hasn't been used for nearly a year." "But," says Maria, "they say mites live in cracks like bedbugs, and that old boxes are not safe to use at all." "Where did you hear such nonsense as that?" demands her lord and master. "Why," she replies, "I read it in that Poultry Book Mrs. H: lent me." "Maria Anderson, are you fool enough to read what those cs&zy chicken cranks write? Why, they don't know a thing about chickens, and sit up in their offices scribbling trash they don't know one thing about, and you read it. Well, I did give you credit for better sense than that." "But this box looks just like they describe, little grayish white specks in the corners, and they say every speck is either a mite, or an egg, and if this is true, this box is swarming with them and I ought to soak it in distillate or lamp oil." "There you go, wasting distillate and lamp oil like that, just for a fool of a scribbler that don't know dust from mites." Thoroughly squelched, Maria dusted out the box and put fresh straw in, making the nest as inviting as possible, and at nightfall the unsuspecting hen was placed therein. Sperkle resented the moving a little at first, but as she had dreams of downy little babes snuggling under her motherly wings, she finally settled down, and the eggs were carefully placed under her.

This box was placed in an old shed, and part of the day the sun beat in cruelly, but, faithful to her trust, old Speckle protected the eggs from the fierce rays by her own body, although a strange restlessness began to take possession of her. It seemed to her that she was the battle ground for an army of crawling, biting, hungry insects, of what kind she didn't know, but they increased daily until life was a torture, no dust bath being thought necessary, and only bare, hard floor in sight. Food was placed before her and fresh water for the first few days, but as other interests took up so much time, at last her wants were forgotten, the water grew hot and stale, and finally there was none at all with which to quench her fearful thirst, made worse by lack of green food, as her master and mistress didn't consider it necessary to give her a succulent bite now and then. To add to her torments, hordes of body lice now made their appearance, to vex her by day, while the nightly army of mites sapped her strength, and at last they didn't leave her day or night. Her nest was running over, the eggs were covered with them, not white or gray now, but full of poor old Speckle's blood, almost black to bursting with it. Her hopes of downy babies be-

RAMSAY'S PAINTS

Not a Mark of the Weather;

the same lustre and brightness as when first applied—no cracking—blistering nor fadeing—that's the kind of Paint you want. RAMSAY'S PAINTS stand the severest tests of weather and time because they are mixed right—honest linseed oil—turpentine and coloring pigment intimately combined — the result of 70 years of practical paint making.

RAMSAY'S are the best looking and best wearing paints made. Ask your dealer in your town.

A. RAMSAY & SON COMPANY, MONTREAL.

No Sane Farmer

will try to run his farm on a paying basis without proper implements and appliances for doing good work, and it should be the same with the farmer's wife. When she has to prepare three meals a day for 365 days a year, she should have in her kitchen an up-to-date range on which she can depend in any emergency, for broiling, baking, simmering or boiling to the best advantage with the smallest possible consumption of fuel.

THE ENTERPRISE MONARCH STEEL RANGE

will do all this, and in addition it is specially adapted for farm work as it has a large fire box for wood burning and large copper reservoir giving ample supply of hot water. Then the MONARCH is so thoroughly constructed that it is not necessary to send to town every few months for repairs.

Ask your wife if she does not want a MONARCH. It may add years to her life by lessening labour and saving time.

FREE THIS MAGNIFICENT DOLL'S HOUSE AND HANDSOME IMPORTED DOLL

also TWO complete sets of beautiful furniture for the house and this lovely gold-finished jewelled ring

GIRLS, THIS IS A CHANCE OF A LIFETIME. DON'T MISS IT. This magnificent doll house is a perfect little palace, EXACTLY LIKE THE DRAWING IN EVERY DETAIL, with its quaint gothic roof with two chimneys, fine porch, lovely verandah and broad handsome front steps. The outside of the house is finished in red brick, the inside is beautifully papered throughout, and every window has curtains. IT IS FURNISHED COMPLETE with the loviest furniture you have ever seen—two complete sets, including sofas, chairs, tables, beds, bureaus, wash-stands, etc.

THE HANDSOME DOLL WE GIVE YOU WITH THE HOUSE is a little beauty. Fully jointed so that she can sit down, turn her head, move her arms and legs, and she is dressed with fine underwear, shoes, stockings, etc., complete from hat to shoes.

Girls, if you want to secure ABSOLUTELY FREE this handsome doll house, lovely doll, the two sets of furniture and the beautiful jewelled ring, send us your name and address at once and agree to sell only 25 of our delicious perfumes at only 10c. each. They come in six lovely odors, rose, carnation, lily of the valley, violet, lilac and heliotrope, and with each package we send a beautiful piece of gold plated jewellery to give free to your customers. This makes them sell like hot cakes. When sold, return us the money, only $2.50, and we will promptly send you all 5 hand some presents carefully packed, exactly as represented. We arrange to stand payment of all charges right to your door with free goods covering same. DON'T DELAY, write us to day, and in a few days you can have the magnificent house and all the beautiful presents. Address— NATIONAL SALES CO., Ltd. Dept. H 284 TORONTO, ONT.

gan to fade and she gave miserable little moans, hoping for help from her troubles, but none came, and at last her soul (if hens have souls) fled to a happier home, and when the time came for that hatch to come off, her mistress bethought herself of her, and found her dead upon the nest, millions of mites swarming among the eggs, and her hopes of choice chicks gone glimmering. Tears fell over the faithful martyr, I ween, and the husband was called to see the result of his stubbornness, and a partial convert to the fact that "maybe those chicken cranks do know a little something after all," was gained, but Speckle was not there to share in the better care setting hens would have on that place in future, her sacrifice was ended.

The pity of the above tale is that it is true in so many hundreds, nay, thousands of cases, and the unnecessary sacrifice goes on year after year, and will, until people learn to respect the opinions of those who have made the care of chickens a study, just as any other business is studied. Then, and not until then, will hens have proper care and chicks be well hatched and cared for.

We will now visit another hen yard, where an eager little boy runs to tell mamma that "the little red hen wants to set, mamma, the little red hen wants to set." Mamma smiles as she hurries to see if this be true, and as the pet referred to resents her approach by ruffling up her feathers and trying to be cross (unavailingly), she hastens to prepare a suitable place. "Get me a nice, clean box, son, and see how mamma fixes it." Sonny happily runs and brings, perhaps, a box he has been saving for his own manifold uses, but is pleased if mamma accepts, and watches her get it ready. First, this wise woman explains to the boy the habits of mites, as she has read in the down-to-date poultry books, how they hibernate in the cracks, and she illustrates the care of setting hens by pouring distillate into every corner, and letting it run through and through, "for, although this is a new box, the hen may carry a few in her feathers from her old nest, and we don't want them to find a place to lodge in." The box is allowed to air a while, then fresh straw is put in carefully, and a shady place found to set it in, away from other chickens. Right here I want to digress and say that queer places are sometimes chosen for setting hens, one woman putting them under the family bed, unbeknownst to her husband, to that worthy's consternation as he heard the hen turning the eggs in the middle of the night, and covered his head and whispered, "Burglars under the bed, saints preserve us!" A shady, cool place being found in some unused shed or building, said shed is then thoroughly sprayed with the distillate lest there be mites lurking there. A dust bath is provided, a dish of food is placed conveniently, and water and lawn clippings provided. Then at nightfall the happy little hen is placed in her comfortable quarters and a seteing of her own eggs placed under her (although she would be just as faithful to another hen'seggs). Every day the water dish is cleaned out and fresh water provided, and every other day fresh green lawn clipping or a little alfalfa is given. Lettuce and chard is rather too loosening for a setting hen, but clover or alfalfa can be given sparingly with good results. Grit is also given, and the happy hen, free from pests, dusted twice a week, is not allowed to want for anything, and in due time brings out a fine clutch of healthy chicks, which we feel sure will be cared for sensibly, and according to the best advice given in modern poultry literature. Which of these ways will you choose, my reader?—Mrs. Frank Metcalf, in California Cultivator.

What clothing is to man, paint is to property. Unprotected houses and barns, wagons and machinery cannot resist exposure to sun, wind, frost and rain. Rust and decay cost more than paint and varnish—that's why the use of Good Paint is wise economy. There's a merchant in your town who can supply you with reliable and durable finishes for every use.

SHERWIN-WILLIAMS PAINTS & VARNISHES

Around the Farm

Sherwin-Williams Paint—SWP—for the farmhouse. Covers most, looks best, wears longest. Ask for a color card—48 attractive shades.

Sherwin-Williams Barn Red—a rich durable red that spreads easily and covers well over rough lumber.

Sherwin-Williams Wagon and Implement Paint—protects the wood and metal of wagons and farm machinery, implements and tools from rust and decay. For Buggies use Sherwin-Williams Buggy Paint.

Sherwin-Williams Metalastic for windmills, metal roofs, and all metal surfaces. Prevents costly rust and decay.

Inside the House

Sherwin-Williams Brighten-Up Finishes include a paint, varnish, stain or enamel for every household use.

Sherwin-Williams Floorlac, stains and varnishes woodwork, furniture and floors in one operation. Looks like expensive hardwoods.

Sherwin-Williams Family Paint, over 25 attractive shades. For cupboards, tables, chairs, etc.

Sherwin-Williams Inside Floor Paint quick-drying and durable. 10 shades.

Sherwin-Williams Buggy Paint—Nine beautiful shades, for porch furniture, boats, flower-pots, swings, garden implements, etc.

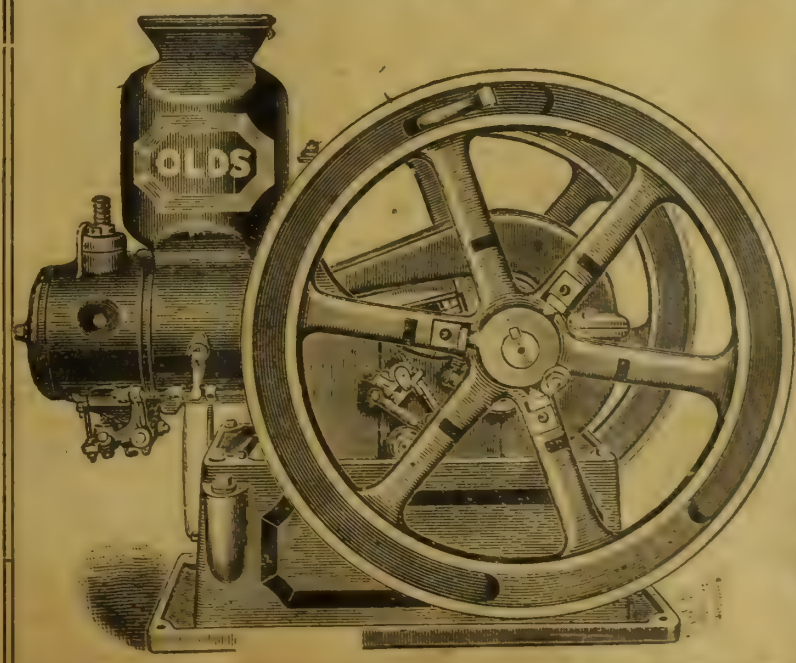
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The White Sun Bonnet.

The clearing is little and rough and brown,
With jagged stumps where the axe descended;
A spring, where the sere leaves eddy down,
And harrow passes by briers defended.
The cabin stands on the forest's edge—
The window shines with the light upon it—
And over the twisted wild-grape hedge
I see the gleam of a white sun-bonnet.

Her hair is dark as the veil of night,
Her cheek is brown with the sun's caressing;
Her eyes are pure as the taper light
The foot of the Virgin almost pressing;
Her lips are sweet as the half-shut rose,
She graced this morn when she stooped to don it,
Her low brow under her tresses glows,
My woodland girl of the white sun-bonnet.

My axe strikes keen and sure on the tree
As I shout aloud with a joyous spirit,
The hut I builded for her and me,
And Paradise blossoms in and near it,
I set the window within the wall,
She hemmed the curtain that flutters on it—
To-morrow, the last sweet touch of all,
I shall drive the peg for her white sun-bonnet.

—From the Pacific Monthly.

Love's Barrier.

(Continued from last issue).

CHAPTER XXII.

FOR LOVE OF AUDREY.

The factories of Hayes, Bartlett and Hayes cover more than an acre of ground on the level plain outside Bradfield town. The business had been founded by old Christopher Hayes, who had ultimately taken his manager, Eneas Bartlett, into partnership, and married his sister. From a small handloom weaving factory, it had grown into a mighty concern, replete with every modern inpention for labour saving and swift production. There were no Bartletts now in Brettle Mills, only Geoffrey Hayes and his younger brother, Christopher. Christopher, familiarly known as Kit Hayes in the West Riding, was no asset to any business; he was in many respects the cross of his brother's life. There were no sons in the family, Kit being childless, and Geoffrey father to a solitary girl. At their death, therefore, the Brettle Mills must pass into the hands of strangers. For this reason Geoffrey Hayes had been inclined to do well by John Ridd, and to give him more encouragement in every direction than his wife approved of.

He was the son of an old friend of Geoffrey's younger and humbler days, and had proved himself more than worthy of the chances that had come in his way. The master of High Ridges depended more than he knew on the strong, shrewd loyalty of John Ridd, and though he was fully aware that he loved Audrey, the idea did not fill him with either dismay or indignation. The announcement of her engagement to Major Hunt at Marienbad had appeared in very large print in the Bradfield Gazette, being regarded as an event of the utmost local importance. It had, of course, been a blow of no ordinary kind to John Ridd. He had never alluded to it, nor had Mr. Hayes, but the light had gone out of the young man's face, He could not hide it, and the sight of John Ridd's misery added to the sum of Geoffrey Hayes' discontent. He had not sought the alliance with Gerald Hunt; it had been wholly his wife's doing, and though he had not refused his consent, he had given it rather grudgingly. He could not honestly say he liked the man, though he admired some of his qualities.

"What I do say, Maria, is that he isn't the husband for our little Audrey. He's too much the man of the world. I wish I felt easier about it in my mind."

But the very fact that he was so much a man of the world commended him to Mrs. Hayes. He represented the section of society she wished to enter, and of which she was determined that Audrey should become an ornamental unit. Lady Adela had promised, after she had made careful inquiry as to the amount of dowry the mill-spinner's daughter was likely to possess, that she would do her utmost to launch her well. She liked the girl for her own sake, her natural sweetness and gentlehood would make her task of the easiest. For the first time in her life Lady Adela was genuinely pleased with her nephew.

Great wealth had never tempted Geoffrey Hayes to slacken in his personal attention to his business. He was quite well aware that he was the mainspring and head of it, and that when he began to slacken his energies it was bound to decline. There was no one in the firm saving and excepting John Ridd who possessed a tithe of his energy or business acumen. He looked forward somewhat ruefully to the day when it might be to all their interests to float the business as a company concern.

It was his custom to leave High Ridges every morning at half-past eight to catch the nine o'clock train at Midcar, which brought him to Bradfield at a quarter to ten. It was the only train in the day that ran through the Junction without stopping. After nearly two months' absence on the continent he found plenty at the works needing his attention, and he had many consultations with John Ridd. He was, indeed, engaged with him relative to some desired extension of the business with Continental firms, when the young clerk whose business it was to attend to his private room, knocked at the door and said a lady was waiting below to see him.

Hayes glanced at the clock with surprise, and then at John Ridd.

"Half-past eleven—a lady! What does she look like, Briggs; not an insurance lady, eh?"

"No, sir; a real lady," answered Briggs quite innocently.

"Can't think what she wants here. Go and get her name—or no, just show her up. You can go now, John; we'll go into the matter later. I'm of opinion you're right after all; its hardly worth our while. I thought it would be when I was over there, but I see your point of view."

Ridd gathered up the letters, and prepared to withdraw. He was a fairly tall, well-built young man, with a good square head and a very pleasant, open face. He looked old for his years, which were only five-and twenty. But he had been fighting for his own hand since he was left fatherless at thirteen. He closed the door quietly, and in the passage outside met the lady, whom to his surprise he recognised as Mrs. Secretan, the wife of the Midcar Rector. They had met on one occasion at dinner at High Ridges. They exchanged bows, and John Ridd passed on. Afterwards he remembered that Mrs. Secretan had not looked quite like herself.

Geoffrey Hayes' surprise at sight of Mrs. Secretan was naturally very great. But he looked pleased enough.

"Mrs. Secretan! This is a very unexpected pleasure—only the second time, I think, that you have honoured the Brettle Mills."

He offered a kindly hand, and hastened to set a chair for her, not, however, before he had noticed that she looked pale and rather ill.

"Have you walked any distance?" he asked with his usual kindly solicitude, which made all women like him. "You look rather tired."

"Only from the station. I came down on the ten-fifteen. Thank you, I am not tired at all. I must apologise for coming here at this early hour when you must have so much to occupy you. But I wished particularly to see you, and thought I should be more likely to find you here early than late. You have so often things to do in Bradfield outside of your business."

"That's true enough; I am pleased to see you, of course, but you know that it would have given me pleasure to have called at the Rectory on my way up had you only let me know you wished to see me."

"I wished to see you here," she said quietly, and then he became aware that she was in an extremely nervous state.

"What can I do for you?" he asked with great kindliness. "Your face suggests that you are troubled about something. I hope the rector is quite well, and you also? My wife told me of your fainting the other night. I hope you have quite recovered from it."

"Oh, quite; indeed I had forgotten it. Will you allow me to tell you a story, Mr. Hayes? Can you spare me half an hour? It is necessary that I should tell you the story; it will explain the errand on which I have come."

"Why, yes; I can spare the time easily. I will just make sure that we shall not be disturbed." He touched the electric bell and Briggs appeared, in no doubt that he was summoned to show the lady out.

"I am not to be disturbed for half an hour, Briggs, on any pretext whatever. Don't come to this door again until I ring. Send any inquiries to Mr. Christopher, or Mr. John."

"Yes, sir," said Briggs, and obediently withdrew.

Helen began to draw off her gloves. She was trembling a little, and Geoffrey Hayes, wholly at a loss, waited rather anxiously for what he should hear. Many people brought their troubles to him, and he was usually able to suggest a way out. But he could not possibly imagine any trouble at Midcar Rectory unless a monetary one.

"I have to be very personal, Mr. Hayes. I am the central figure; at least, one of two central figures, in this little story. I wish to tell you that before I met my husband I was engaged to another man, a soldier, who was stationed with his regiment at Colchester. He had nothing but his pay, and I, of course, was poor too; but we loved, or thought we loved each other dearly. I was not very happy at home just then, and for that reason, perhaps, I gave my affections more unreservedly to the man who was kind to me. I would have followed him to the world's end without a question or a doubt. We were engaged secretly because he was in dread lest his family should know. But we met very often, we used to spend long days together in the country, and people talked about us a great deal. I simply did not care. He was the only joy I had in my life, and so few people had been kind to me since my father's death that I did not care about their good opinion or whether they talked well or ill of me.

"He was not well liked in Colchester, and many people warned me against him. He brought a reputation with him which was not what the nicest people liked. But he did not mind about that, he knew it would only be for a short time; and that opportunity would soon come for him to go elsewhere. He was everything to me, I thought we were everything to one another.

"One day something happened which turned out very badly for me. We were spending the day together in the country, and somehow we managed to miss the last and only train which could take us back to Colchester that night, and had to stay at a remote country inn until the morning. He laughed at it, and did not take the precautions he might have taken to make everything right for me. He

MOTHER OF LARGE FAMILY

Tells How She Keeps Her Health — Happiness For Those Who Take Her Advice.

Scottville, Mich.—"I want to tell you how much good Lydia E. Pinkham's Vegetable Compound and Sanative Wash have done me. I live on a farm and have worked very hard. I am forty-five years old, and am the mother of thirteen children. Many people think it strange that I am not broken down with hard work and the care of my family, but I tell them of my good friend, Lydia E. Pinkham's Vegetable Compound, and that there will be no backache and bearing down pains for them if they will take it as I have. I am scarcely ever without it in the house.

"I will say also that I think there is no better medicine to be found for young girls. My eldest daughter has taken Lydia E. Pinkham's Vegetable Compound for painful periods and irregularity, and it has helped her.

"I am always ready and willing to speak a good word for Lydia E. Pinkham's Vegetable Compound. I tell every one I meet that I owe my health and happiness to your wonderful medicine." —Mrs. J. G. JOHNSON, Scottville, Mich., R F D. 8.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotics or harmful drugs, and today holds the record of being the most successful remedy for woman's ills known.

promised to go to another inn two miles away, but I found next day that he had not gone away at all, and also that we had been seen by two young subalterns, who, of course, were only too ready to make the most of the story. You follow me, Mr. Hayes?"

The colour had risen in her cheeks now, and the clenched hands on her lap indicated how the recital had moved her.

"I understand perfectly, and the man was a scoundrel," said Geoffrey Hayes without a moment's hesitation.

"At least he was unkind, and selfish, because he knew, none better, what a nest of lying and evil speech a garrison town can be. In less than forty-eight hours we were the talk of the town. When I went out, I was cut in the street by the people I had known, and my stepmother, not very kind at the best of times, was furious. I can't think how I managed to live through those frightful weeks; the only thing that sustained me was clinging to the hope that when I became his wife everything would be made right.

"About six weeks after that his regiment was ordered to India. He left me without coming to say goodbye. He wrote me a letter—I have it here in my bag; I brought it in case you should be difficult to convince. In this letter he expressed great sorrow for all the suffering he had caused me, and said that if the fates had been kinder to us he would have married me there and then; but it was impossiblef He must marry money. He thought it better not to come and bid me a personal goodbye; it would be too hard on us both. And that was all."

"The scoundrel!" said Geoffrey Hayes between his teeth. Then seeing something more in Helen's face, he rose to his feet. "What are you going to tell me, Mrs. Secretan? Not—not—that the scoundrel you have just told me of, and the man who wishes to marry my little Audrey are one and the same?"

"That is what I have come to tell you, Mr. Hayes. The man was Gerald Hunt, and when I met him the other night in your house, and thought of all that might happen if Audrey was given into his keeping, I did not know what to do. But God showed me by and by; before the morning I knew that I must prevent that marriage at any cost to mysell."

Hayes walked to the window and stood looking out upon the pleasant stretch of green sward spread before the office windows. Helen bore the silence as long as she could.

"Perhaps you think I should not have spoken," she began timidly. "But if you knew that man as I do, his worldly heart, his—his srorn of everything that Audrey has been brought up to love and reverence, you would feel as I do. I entreat, at least, that you will believe I have not taken this step out of any mean or spiteful personal motive, for indeed it is likely to cost me very dear."

Listening to these pathetic words, Geoffrey Hayes felt his heart melt within him with pity and respect for the woman who had braced herself to render this true service to him and his. He wheeled round suddenly, and the expression on his fine face instantly comforted her.

"Mrs. Secretan, I understand; I quite understand. God will reward you for this; I never can! Give my little girl to such a man? No, by God I won't! I have never liked him quite; there is something in the background against which my soul revolts. From the bottom of my heart I thank you."

Helen, still trembling, rose to her feet, but he set her down again and stood in front of her with an expression of astonishing kindness on his

An I H C Manure Spreader Saves Valuable Fertilizer

THE farms of Europe have been worked for centuries, yet the average production of wheat from those farms is nearly 30 bushels per acre; more than double the average yield of American farms. What is the reason for this tremendous difference?

The reason is that European farmers know the value of stable manure as a fertilizer. The average European soil is not as fertile as the average American land, but the European grows heavier crops because the fertility of the soil is kept up constantly by the liberal use of stable manure.

While there is not so much stable manure in this country, what there is can be used to far greater advantage when an I H C manure spreader is used to distribute it.

I H C Manure Spreaders Corn King, Cloverleaf

make one ton of manure go as far as two tons spread by hand. By pulverizing the manure and spreading it in an even coat, light or heavy as may be needed, all over the land, they insure a perfect combination of the plant food elements with the soil. There is no over fertilizing in spots, to produce an uneven stand of grain. Each square foot of ground gets the same treatment.

The superior mechanical construction of I H C spreaders is the reason for their effectiveness. They solve every problem of correct spreading. Light draft is secured by the proper construction of wheels and correct principles of gearing. When I H C spreaders are thrown in and out of gear the beater drive chain is not shifted.

The advantages of this construction are: Positive traction—the chain engages nearly half the teeth on large sprockets instead of only a few; chain worn on one side only instead of on both sides as in other constructions; simple, effective chain tightener instead of a complicated, troublesome one. These all add to the durability of the spreader.

I H C spreaders have no reach. They do not need one. Because of this feature an I H C spreader can be turned in its own length, a great convenience at any time. I H C spreaders have many other advantages which the I H C local dealer will explain to you. See him and get catalogues and full information, or if you prefer, write

RU-BER-OID Roofing

TRADE MARK REGISTERED.

Lessens Fire Risks

Fire Insurance Companies assess buildings covered with Ruberoid at the "base" or lowest rate.

That is because a RU-BER-OID Roof will not catch fire from flying cinders or even burning brands—and because the one-piece, air-tight, fire-resisting RU-BER-OID Roof helps to hold down a fire starting within.

RU-BER-OID Roofing will not warp or crack like shingles—rust like metal roofs—nor rot, dry out nor crumble as so many ready roofings do. It gives fuller and more lasting protection per dollar of cost than does any other roofing.

Made under Canadian Patents 93,027 and 93,160, in 3 Permanent Colors—Red, Brown and Green—and in natural Slate. Write for Samples and Booklet, "RU-BER-OID—Why?"

THE STANDARD PAINT CO. OF CANADA, LIMITED.

MONTREAL. WINNIPEG. CALGARY. VANCOUVER.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally—D.S. Bach, Manager, 1900 Washer Co., 357 1-2 Yonge St., Toronto.

face.

"It will be extremely difficult to do, Mr. Hayes; but one thing has comforted and strengthened me: I do not think that Audrey's feelings are very deeply engaged. I am sure that only her girlish vanity will suffer. It will not be a livelong sorrow to her. If I had feared that I should have hesitated."

"You are right; you are quite right. I don't mind telling you frankly, now, that this affair has been pushed for all its worth by my wife. She is different from me; she thinks the world of things which seem to me of no account. It is happiness I want for my little girl, and please God she will have it yet!"

Helen began to draw on her gloves. Now that the ordeal was over, she felt very weak and faint, but an ineffable peace filled her heart. Geoffrey Hayes' next words, however, caused the colour to leap painfully in her cheeks once more.

"Major Hunt came down with me this morning, and I have to meet him at the 'Golden Fleece' for lunch at one o'clock."

Helen rose hurriedly and glanced at the clock.

"I must be getting back. I cannot face him again. He will not be very much surprised, Mr. Hayes. I saw him yesterday, and told him what I was going to do."

"You did? You are a brave woman, Mrs. Secretan, and a good woman as well. I wish I rould tell you how highly I honour you. Some day, Audrey shall know what a friend you have been to her."

"I love her dearly; she has talked a great deal to me, and I know from these intimate talks that she could not, and would not be happy with Major Hunt. He would break her heart. That is my sole reason for what I have done. Now I will go. I can walk by the lanes to Wild Lane Station, so that I shall not have any chance of seeing him."

"I shall not allow you to go like that. You will stay here for another half an hour. They will bring you some lunch up; there is always something to be got here, for some days we have not time to go out. And afterwards there will be a brougham to take you to the station. I shall look in this evening, as I come up and tell you the sequel."

"Don't do that. I—I can't tell you why. Leave it. I shall know everything is right now I have given it into your hands. Only two more things I have to ask."

"Ask them, they are already yours," said Geoffrey Hayes in full tones.

"One is that you do not tell Mrs. Hayes my story. You will excuse me saying that I fear she might take a different view—she might blame me. If you can arrange it without telling her, it is the one service I would beg at your hands."

"Even if you had not asked me I should not have told my wife. It must be sufficient for her, as for Audrey, that Major Hunt cannot enter the family, and that I have abundant reason to forbid him the house."

"You will forbid him, then?"

"Absolutely! He shall not even return there to-night. I will have his things sent down. I have your permission, of course, to mention your name in the matter."

"Why, of course. You could not avoid that, however anxious we both might be. I counted the cost first, but may I ask one more favour—that you will not permit this to make any difference between High Ridges and the Rectory? What I want to say actually is, don't cut me off from Audrey."

"Cut you off! God forbid! I don:t think you quite understand what this means to me, Mrs. Secretan; how I honour you for what you have done."

"It is not only on my account or

A Credit to the Name

If you already know Red Rose Tea you will expect much of Red Rose Coffee because of its name alone. Nor will it disappoint you; for it is worthy of its name.

Blended to combine strength and rich flavor, this fine coffee is crushed new-roasted into small grains, and freed from chaff and dust. These uniform grains readily give the true coffee flavor to a brew which pours clear without any sediment. You may expect rare quality from every tin of

because of his harsh treatment of me. His past will not bear such investigation as you would desire. In a word, he is not a fit husband for Audrey. I know it, and he knows that I know it, that is all."

Within the hour Helen left the Brettle Mills, being put into the hired brougham with great care by Geoffrey Hayes himself. He stood with his hat in his hand until she drove away, and she knew that he honoured her in his heart. She had made no mistake with him. Audrey would be saved, but her sinking heart told her that the price had still to be paid.

(Continued in next issue).

One Picnic.

Puff! Snort! The train started off from the little station at Kenwood, that looked as much like the shed beside the little Methodist meeting-house, as if both had been built for the same purpose.

Certain it is, that the horses that occupied the shed, while Parson Willowby expounded the gospel on Sundays, looked far more contented than the small group of children that emerged from the station and walked slowly and silently up the dusty road towards their home. But the silence was not for long. Brown-eyed Bessie soon began to reveal the cause of the tears that welled up in the eyes of her small brothers and sister. "I wouldn't mind staying home so much" she said, "only for that hateful Mrs. Stearns. What right had she to call us "Poor Dears," when everybody knows that we are richer than she is, and papa paid more to the church last year than ever Mr. Stearns did in his life?"

"Well! it didn't help much to get us to the picnic, when we couldn't get enough money to pay for our tickets," put in practical ten-year-old Willie.

Mrs. Lawman was busy preparing dinner and trying to persuade herself that the children really wouldn't mind, and that it was better to have the debts paid first of all. But the tear-stained faces of the four children as they burst in upon her, in high indignation for having missed the picnic, and, worse than all, the sarcastic, cutting pity of Mrs. Stearns, caused her to waver, and to forget for a moment the resolution that she and her husband had both made together to live as far as possible on a strictly cash basis. She felt rather inclined to blame Will for sticking to it so closely in spite of the fact that it would deprive the children of their Annual Sunday School Picnic. In a few moments Will Lawman came in to dinner. He noticed, at once, the signs of recent tears and the rather silent manner of his wife as they gathered round the dinner table, in the large and airy kitchen. Hey! Day! What's tne matter? Been getting in a fuss with Bentley's boys?" he interrogated trying to forget the picnic.

"This is the day of the Sunday School Picnic" his wife answered gravely by way of explanation. "And how was it last year? I don't remember any fuss about it." "We picked berries and there's n— n— n— none this year," and Bessie, unable to control her grief any longer, burst into a violent fit of sobbing.

"Well! there's nothing to cry about," said her father, "there are other things this year. It took nearly all my first milk cheque to pay for the hay-seed that I was obliged to buy on credit in the spring and there is a whole lot of the very best seed going to waste along the railroad track. It is just ripe, so you can each take a pair of shears or scissors and, cut off the heads and then, carry it home in baskets."

The faces of the children brightened visibly. "Could we go to-day," asked Bobby. "And could we dess

BABY'S OWN SOAP

To help the tender skin of an infant is the Baby's Own Soap standard.

Sold almost everywhere—but insist on Baby's Own.

ALBERT SOAPS, LIMITED, Mfrs., - - MONTREAL.

This Plow Is Specially Made For Quebec And The Maritime Provinces

THIS is a plow which we build specially for use in the Maritime Provinces and the Province of Quebec,—is equipped with a mouldboard especially adapted to the soil. We have made a marked improvement in the turn of this mouldboard which makes it much easier for the plowman to hold. For general use in these provinces, except for new, unbroken hard ground, we strongly recommend it. The mouldboard, like on all "B" Plows, is made from special soft-centre steel, and the construction throughout is the very best. Look for the "B" on the mouldboard when you buy; it is your guarantee of quality. This plow will scour in the most difficult scouring soils and, if fitted with our wheel attachment to go under the beam, can be handled with ease by a boy. **If your dealer cannot supply you, write us and we will tell you who can. Tell us the type of soil on your farm and we will see that you get the exact style of mouldboard your land requires. We send our Catalog free on request.**

This is the Plow for Quebec and the Maritime Provinces. Our "B" No. 6.

up and take lunch and have a "make-on" picnic?" piped five-year-old Lucy. "Yes! Why not? Go and have a real picnic."

Dinner was finished in short order, and in a remarkable short space of time, four eager faced happy-looking children skipped along towards the railway track with one at least of their baskets filled with the most important part of a picnic.

Several times during the afternoon they returned to the house to empty the baskets. But they refused to have tea with their parents for were they not having a picnic?

Two sheets sewed together and spread on the granary loft, made a safe place for the odd-looking treasure, which their father estimated would yield at least a bushel of seed. "And how much is that at fifteen cents a pound?" he asked Bessie, who thought herself a great scholar. Bessie had to think, for a moment, before she could remember the number of pounds in a bushel of timothy-seed; although it had been the last table she learned before school closed. Even then she had to multiply it over again and again before she could believe that $7.20 was correct. Such a pile of money! The boys shouted, threw their hats in the air and made as much noise as they could, to celebrate the outcome of the "picnic."

They were too blissfully happy to feel tired, and as their mother put them to bed, after some protests, they declared it was the best picnic that ever was.

It was in the March following before their real triumph came, when the County Seed Fair was held.

The seed had been carefully threshed and cleaned, and entered in Willie's name, Bessie thought it would, perhaps, look unladylike to have her full name on a bag of timothy seed, entered hers as B. Lawman.

What a scramble there was for the paper when the prize list came out; and there, at the top of the page, was their names, Willie's for first and second B. Lawman.

It was an easy matter selling the seed. Several seed merchants wrote asking for it. The greatest trouble was to decide how to spend the money.

They all agreed to put away the prize money to take them all to the Sunday School Picnic the following summer.

Then they wrote out a list of gifts to buy with the remainder, which was promptly discarded for another, anh went on that way for about a month when they adopted the following: Watch Chain for papa, shopping bag for mamma, "Ingersoll" watches for Willie and Bobby, fountain pen for Bessie, and doll for Lucy. Strange as it may seem, each one said it was just what they had been wishing for.

A Choice for Some Girls.

No, I don't agree with you. That is what a great many will reply, and very emphatically, when the opinion is expressed tnat it is better for a girl to go out and earn her own living unless she has to. If you don't agree with it, or if you do, I would still like to hear what you think about it. There are always two sides to a question, and you will certainly feel after reading this little say that it sets forth entirely the one side. It is a live question this,—what is best for a young woman to do, if she has the choice, and it would be interesting to hear what one and another thinks about it.

In Canada there are many fathers so placed, financially, that it is not necessary for their daughters to earn money for self support, and the number so placed increases each year. It is true that the more money we have the more we feel we need, but it is possible that in the struggle to add dollar to dollar we are aiming to accumulate more than is necessary, and are sacrificing present enjoyment and development to future unproductive possession. "After the first primitive needs are supplied, the wants of human kind are dictated more largely by what one's neighbor has than by what is actually required."

Why is it best for a girl not to go out and earn her own living unless she has to do so? She may be taking work from someone else who actually needs it; she is making competition keener; she is helping to lower the scale of wages. If only the girls who had to be there were in the field, there would not be as much competition, wages would, therefore, be better, and the struggle to make her way for the girl who must would accordingly be less difficult. It is not an invariable rule, but it is a very usual condition, to find that the one who is earning from necessity makes a better worker than the one who is

When a farmer opens his first bag of cement

he has taken a long step in the march of Progress, which leads to Prosperity.

After he uses that bag—if only for a hitching-block or a porch step—he has learned some profitable lessons.

He knows that it doesn't take an expert to use concrete successfully.

He knows that he has added a permanent improvement to his property, something that will last as long as the farm itself.

He knows that he has added convenience, and therefore profit, to his home.

He knows that it didn't cost him more, in money or time, than if he had used an inferior material and made a temporary improvement.

He knows that he wants to read the book,

"What the Farmer Can Do With Concrete"

to find out how he can apply these lessons to other places on his farm.

This advertisement is to tell him that his copy of this profusely illustrated book is ready to be mailed as soon as he sends in his name and address. It makes no difference whether he has yet used that first bag of cement or not. If he hasn't, the book will tell him how to use it to the best advantage. And in any case it's

ABSOLUTELY FREE

A hundred and sixty pages of plain description, telling how other farmers have used concrete, with photographs to illustrate every paragraph in the text.

Just send your name and address on a postal, in a letter, or use the coupon, and the book will be sent by return mail.

EWING'S RELIABLE SEEDS MONTREAL

Valuable Book on Barn Building FREE

Write at once for this valuable book. It contains information that every farmer should have regarding the sanitary housing of dairy cows. It explains every fundamental of correct construction and gives proper dimensions and arrangements. It describes lighting, ventilation, stable floors, and their construction, and contains suggestions about silos, site, exposures, appearance, design, drainage and inside equipment. Besides, you will find in this book a number of practical barn plans and other information that may point the way to your saving many a dollar. We have designed many of the finest and most modern dairy barns in this country and this book is based on our long experience and expert knowledge in dairy barn construction. The book contains in concise, clear and condensed form, information necessary to any farmer who is planning to build or remodel. Understand, we send you this book absolutely free without any obligation on your part—just for answering these few questions: Do you intend to build or remodel? How soon? How many cows have you? Will you want a litter carrier? Will you want a hay fork outfit? Send to-day.

BEATTY BROS. BOX H FERGUS, ONTARIO

earning from choice, and the influence of the latter is to lower the standard of pay for the work both are engaged in.

Taking for granted that the girl we are speaking of can be spared from the work of her farm or town home altogether, or for a part of the day, what else is there for her to do but to enter one of the professions, or one of the many lines of work now open to young women? In the first place, by leaving home she is depriving herself of the possibility of the best kind of training for the career which, in her heart, almost every woman hopes some day may be hers, that of wife and homemaker. So in considering "what else can she do," she can and should, first of all learn to excel in the things which concern the career she has at heart. That does not mean dishwashing, plain sewing and elementary cooking. It does mean these things first, but only so that from them knowledge can gradually extend into ever widening avenues. The use of certain preparations on washing day, we know makes the clothes a better color. Would it not be interesting and beneficial to go a step further, and find out what effect these preparations have on the fabrics themselves; and if the effect is detrimental to discover what could be substituted to give as satisfactory results without injuring the garments? Would that not be along the lines of good, of scientific housekeeping? We know that on some days we feel more heavy and drowsy after dinner than on others. Would it not be interesting and beneficial to discover what foods have that effect, and why? Are we not in our housekeeping planning to fit men, women and children to be efficient workers, and if we have the time to study these things is it not a useful occupation? Some will certainly feel this is not very practical work for the young woman who has the opportunity to stay at home. I feel she is privileged in having the chance to pursue it.

But only part of a girl's time would be taken up with actual housekeeping. Should not every girl have a hobby, if possible an outdoor hobby; and should she not have a certain amount of time every day for reading? The necessity for earning one's living often crowds these things out. There is also work a-plenty awaiting those who have a little leisure in which to do it—financially unremunerative work, but paying large dividends in love, in gratitude, in character. For the first year a girl trying to plan her own life and doings (having always previously been under direction) would find it a pretty difficult task; would change her plans frequently as experience suggested changes, and would often find it very hard to keep herself up to doing certain things when there was no actual compulsion. But with a very little perseverance she could win out.

"It is so poky at home," many girls say, and to them the faraway hills look green. But their voyage of discovery to those same hills often leads them to another discovery—that we carry "poky-ness" or the reverse around with us.

"But what if father dies, or our circumstances should change," says the prudent girl; and that brings us to another principal point. While it may not be best for a girl to make her own way unless she has to, I do believe that everyone should receive a training along some special line by which she could earn money if the necessity arose. With that security she could enjoy life at home. In older countries many a girl's hobby has been turned into a remunerative source of income in time of need.

Also it is said many a time, "I can't afford to stay out of business now because perhaps twenty years hence I may have to depend upon myself, and where would I be then?" Would not an ordinary healthy, middle-aged woman, well trained in the ways of a household, be better fitted physically and commercially to depend upon herself, than one who has been in business for that length of time, has borne its stress and is galled with its monotony?

I am not advocating a company of girls unprepared for conditions which they may have to face, girls so sheltered and nurtured that they lack strength to stand alone, but I do feel that the intelligent girl who is not forced to direct her energies into one particular wage-earning channel has a peculiar and special opportunity for development along the lines of her own particular nature, along the lines of her most womanly qualities, qualities which are her greatest strength, an opportunity which she should not lightly put aside when ambition or restlessness tempts her to seek self support outside the home.

If you have had the patience to read thus far, you will be more willing to agree with what was said at the beginning, that there are two sides to every question, and that only a very few phases of the matter have been touched upon. What do you think about it?—Margaret Freeston in Nor' West Farmer.

Cradles in Other Lands.

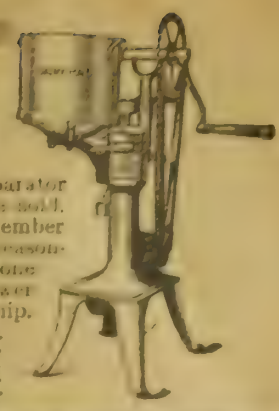
In Lapland a new-born baby is cradled in its mother's shoe, a big affair, covered with skin and stuffed with soft moss. This the mother can hang to a tree or cover with snow while she is busy. In India the baby rides in a basket which hangs from its mother's head, or from her hips in a hammock. Sometimes the baby's nose is adorned with a nose-ring; and in some parts its face is wrapped in a veil like its mother's. The Chinese baby is tied to the back of an older child; while the Mongolian infants travel about in bags slung on a camel. Strangest of all, the mother in Guinea buries her baby up to its waist in sand, and that is the only cradle the baby ever knows.

Worlds for Explorers.

Notwithstanding the rapid advance of exploration in various parts of the globe, a recent estimate by a member of the American Geographical Society shows that no less than 20,000,000 square miles of the earth's surface yet remains unexplored.

The largest unexplored area is in Africa, 65,000,000 square miles, but even North America contains 1,500,000 square miles of virgin territory. It is surprising to learn that there is three times as much land awaiting the foot of the pioneer in North America as in South America.—Philadelphia Record.

The Best Cream Separator is the Cheapest in the End



THE cost of manufacturing a cream separator determines the price at which it may be sold. Therefore, when selecting a separator, remember that the machines which are offered at an unreasonably low price can be offered at that price for one reason only—they are built to sell at prices lower than the cost of good material or workmanship.

Such separators are costly at any price. Only a good separator is cheap; not because of a low first cost, but because it will last for years and save enough butterfat from the milk of four or five cows every year to pay for itself. The best workmanship and material that money can buy are used in making

I H C Cream Harvesters Dairymaid and Bluebell

You will find an I H C the cheapest separator you can buy, because it will do better work and last longer than any other separator.

Go to the nearest I H C dealer who handles these separators and see how carefully they are made. You will find that they have phosphor bronze bushings—that the gears are spiral cut—are entirely protected from grit and milk, and at the same time are easily accessible.

The neck bearing is trouble-proof. The patented dirt-arrester chamber removes impurities before separation begins. These separators are made in four sizes. Ask the I H C local agent to show you one, and give you a catalogue, or, write the nearest branch house for catalogue and any other information desired

A Windsor Lady's Appeal.

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 309, Windsor, Ont.

Returns From Money Invested in the Soil.

"Many farmers would get higher interest on their money if deposited in the shape of fertilizers in the soil than if they placed it in a bank, the interest being paid in increased crops. The returns are surer than if the money were invested in a gold mine."

During the past few years a number of educative, illustrated bulletins have been prepared by agricultural experts on the use of fertilizers in Canada. Amongst these are:

"Artificial Fertilizers, Their Nature and Use."
"The Potato Crop in Canada."
"Fertilizing Fodder Crops."
"Fertilizing Orchard and Garden."
"Farmer's Companion."

FREE copies of these bulletins as well as special expert advice as to purchasing and applying fertilizers economically may be obtained on application to

1105 I. O. F. Temple Bldg., Toronto, Ont.

STAMMERERS

can be cured, not merely of the habit, but of its cause. The Arnott Institute has permanently restored natural speech to thousands—is doing it to-day. Write for full information and references to 11

THE ARNOTT INSTITUTE. BERLIN, ONT., Can.

Influence of Home Life.

What the children see in the daily life at home will undoubtehly have a stronger influence over their young lives than anything else. If the mother is quick, impatient, and fault-finding, she cannot expect a sweet-tempered, sunny daughter; if the father drinks, gambles or is sharp in business, he cannot expect a son that will be the pride of his heart for honesty and uprightness. That homely old saying, "Example is stronger than precept," has lived because of its great fundamental truth, and it can be daily proven by those entrusted with the training of children. And the fears from which the little ones suffer can be overcome with the aid of conscientious parents. As Emerson says:

"In brief, you will have to carry on your higher education at the same time you are educating your children. Intellectually you must cultivate to good purpose that most complex of subjects—human nature and its laws, as exhibited in your children, in yourself, and in the world. Morally, you must keep in constant exercise your higher feelings and restrain your lower. It is a truth yet remaining to be recognized that the last stage in the mental development of each man and woman is to be reached only through the proper discharge of the parental duties. And when this truth is recognized, it will be seen how admirable is the ordination in virtue of which human beings are led by their strongest affections to subject themselves to a discipline which they would else elude."

Washing the Breakfast Dishes.

Dish washing may be done now. Although in some homes, especially where much cooking is done or where many come home to luncheon, it is best to go directly upstairs after breakfast, make the beds and do the slight clearing up which is all that is necessary on other than cleaning days. This done, one is at liberty for kitchen-work and cooking without being interrupted. Another thing, after a strenuous morning in the kitchen one is likely not to think of the beds, until upon going upstairs one is confronted with this work. A feeling of depression is sure to follow, for by this time one is weary and the thought of extra work seems unendurable.

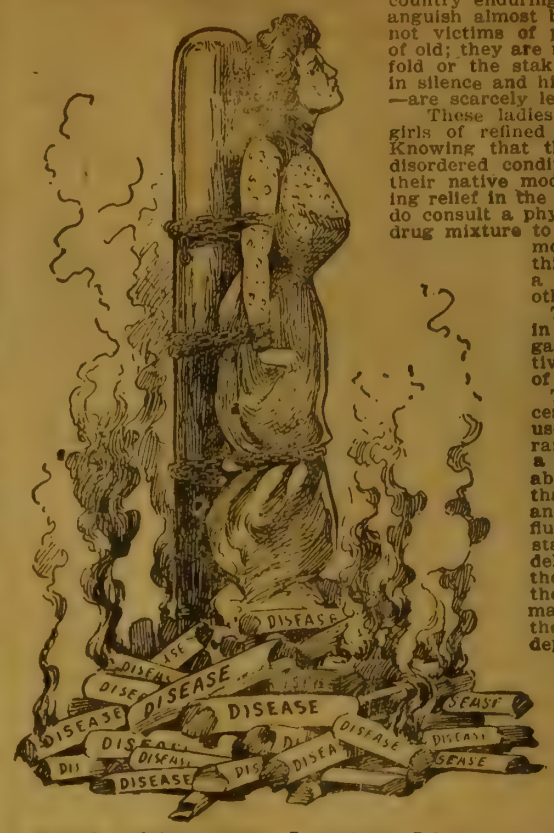
However, even though the bedrooms are attended to immediately after breakfast the dishes should all be removed from the dining-room and scraped and properly stacked before one goes upstairs. In this way one will not come back to confusion nor will a casual visitor see an entirely disordered house.

On Monday while straightening up the various rooms, put to one side all Sunday's clothes which require pressing or extra brushing. Also all which need repairing or special attention in any way. These may be attended to in the afternoon.

Hints on the maintenance of good hearing are given by the Family Doctor, which points out that the inside of the ear should always be left alone. The wax in the ear is absolutely necessary to keep it in a healthy condition. Never try to get it out. Washing the auditory canal with soap and water is also injurious, as in this way the wax is moistened. Never put cold water or any other cold liquid in the ear. When going for a swim insert cotton, or, what is still better, a little wool in the ears. When out in a cold wind or snowstorm it is best to protect the ears. Avoid blowing the nose violently in case of a cold. This sometimes causes the inflammation to spread into the eustachian tube, and causes deafness.

MODERN MARTYRS!

The age of martyrs is not passed. There are thousands of women all over the country enduring physical torture and mental anguish almost beyond description. They are not victims of persecution, like the martyrs of old; they are not called on to face the scaffold or the stake, but their sufferings—borne in silence and hidden from the world at large—are scarcely less intense.



These ladies, as a rule, are women and girls of refined and sensitive temperaments. Knowing that their sufferings are due to a disordered condition of the female functions, their native modesty deters them from seeking relief in the earlier stages; and when they do consult a physician, they usually get some drug mixture to take internally, which is not more effective for troubles of this kind than it would be for a toothache, a bruise, or any other strictly local ailment.

The seat of the trouble being in some one of the female organs, the remedy, to be effective, must act on this portion of the anatomy.

This is the secret of the success which always follows the use of ORANGE LILY in derangements of this kind. It is a strictly local treatment. It is absorbed directly into the parts that are inflamed and congested and its beneficent, soothing influence is noticeable from the start. The irritation of the delicate membrane is relieved, the congestion is overcome by the discharge of the watery matter which served to oppress the nerves and cause mental depression; the nerves are toned and invigorated; and the sunshine and joy of life again becomes part of her being. Read the following letters:

Archer, Ont., Feb. 1, '09.

Dear Mrs. Currah:—I received your kind letter some time ago, but was feeling so well, and not needing medicine, that I neglected replying sooner. I must say I have more confidence in ORANGE LILY than in any other thing I have ever used. Before I knew or found out anything about this medicine, I doctored away hundreds of dollars, and when I thought I was dying with inflammation of the womb, a box of ORANGE LILY was sent me through the mail from a friend. The first suppository I used I was greatly relieved, and in a few months completely cured. That was nine years ago this winter, so you can imagine with what esteem I hold the ORANGE LILY. I am thankful there is such a relief for poor, suffering women, for I have been one of them and can sympathize with others. Your sincere friend, MRS. NORMAN WEAVER.

Trenton, Ont., Dec. 4th, 1909.

Mrs. F. E. Currah, Windsor, Ont.—

Dear Friend,—I feel it my duty to write you a testimonial as to what Orange Lily has done for me. Last winter I was feeling very miserable indeed. I could scarcely do my housework during my menstrual period, and for two months or more I was never free from pain in the womb and ovaries. The pain would run down the groin, so I would frequently nearly double up. Then the pain began going up the back of my neck to my brain until I hardly knew what I was doing at times. Life was a burden indeed. I finally could endure it no longer, so went to our leading town doctor and had an examination. He pronounced it (I forget the word) a rigid condition of the generative organs, produced by repeated attacks of inflammation. He said I would have to take a course of treatment, and if that failed to overcome the rigid condition I might, in time be compelled to have the ovaries removed. I objected to that, so filled out Dr. Coonley's symptom blank and forwarded it to him, and he diagnosed the disease the same as my local doctor, so I decided to take Dr. Coonley's Treatment. I have used two jars of Cerate Massage, two packages of Herbal Womb Tonic and six boxes of Orange Lily. It is eight months since I began the treatment, but I feel like a new woman. I work right through everything now. Hardly know a pain, even during menstruation now. I often say, "I would not take $100 and be in the state that I was last March." I feel that Dr. Coonley's Home Treatment is a Godsend to suffering womankind, and shall continue to sound its praises whenever I have an opportunity.

Yours gratefully, MRS. T. H. HATTON.

ORANGE LILY as a remedy for these ills, as well as for leucorrhoea, painful periods, irregularities, cancers in their earlier stages, tumors, displacements, lacerations, and all ovarian troubles, has long since passed the experimental stage. So confident am I of this that I will send ten days' treatment, which is worth 35 cents, to any sufferer ABSOLUTELY FREE. The treatment is inexpensive, used at home, and no physician is necessary. Send at once for the

FREE TRIAL TREATMENT

which will demonstrate that ORANGE LILY will cure you. Enclose stamps, and address MRS. FRANCES E. CURRAH, WINDSOR, ONT., Can. Rep., Coonley Med. Inst.. Delays are dangerous. 11

THE SIEMON COMPANY LIMITED

Authorized Capital $1,000,000.00

Business established 26 years with trade connection in principal countries of the world. This is one of the largest businesses of its kind in the world.

The Company do their own financing, and pay **interest twice a year,** on 1st of June and December, and allow the investor to withdraw his money at end of one year on 60 days' notice if desired.

This security is different from any other ever issued with its **Profit Sharing Features,** and is as safe as any farm mortgage. Investors wanting the highest earning capacity with absolute safety, should write at once for full particulars to

NATIONAL SECURITIES CORPORATION, LIMITED

Confederation Life Building, Toronto, Canada.

Avoid Nostrums

Drugs never have cured, and never can cure Constipation. They work by introducing a poison into the system. Nature endeavours to cast out the poison and in doing so the cells are stimulated into temporary activity; but are left weaker than before by the reaction. Next time a larger dose is necessary and finally nature gives up the struggle and the poison remains in the system.

The only safe and permanent cure for Constipation is the

Internal Bath

It cleanses the intestines—removing the poisonous accretions The digestive organs, relieved of the obstructions in the lower bowls resume their proper functions.

The internal bath is rendered convenient, safe and without discomfort by the J. B. L. Cascade, the invention of Dr. Tyrrell of New York. A 64-page book entitled "Why Man of Today is only 50 p.c. Efficient" describing the internal bath, with full directions for home treatment, will be sent free on application to

The Production of Mutton as Influenced by the Application of Manures to Pasture.

Following is a report of experiments carried on during fourteen years simultaneously in several districts in Great Britain with a view of ascertaining the results of manuring permanent pastures.

The trial fields were pastured with sheep the results being obtained in terms of live weight increase. Following is a summary of the conclusions reached:—

1. Cake of various sorts was fed to sheep on pasture at 11 centres, and in no instance was the outlay on the cake recovered in the increased mutton produced by the sheep in the season when the cake was consumed.

2. In the latter part of the grazing season sheep getting liberal allowances of cake did not increase in weight to a greater extent than those getting no cake, but which were grazing pasture that had been improved by liberal dressings of basic slag.

3. The residual values of cake were occasionally higher than is usually estimated, but, in comparison with basic slag, cake-residues had a poor ameliorative effect on the pasture.

4. Even when both direct and indirect effects of cake are taken into account, the original outlay was not recovered at two of the three main stations. This result was confirmed at such of the minor stations as were concerned with this problem.

5. It would appear to be bad practice to feed cake on pasture containing much clover, as the nitrogen in the cake residues has a tendency to repress the clovers by stimulating the non-leguminous plants.

6. Common burned lime, used alone at the rate of four tons per acre, has proved very ineffective; but smaller dressings of ground lime, when added to a phosphatic dressing, have sometimes been justified.

7. Basic slag applied as a single dressing at the rate of half a ton per acre, has generally proved a most effective agent in improving the feeding value of pasture, and its effects are not nearly exhausted at the end of nine years.

8. It has proved much more profitable to apply a heavy dose of basic slag as a single dressing, than to divide it into two equal portions and apply these with a three years interval.

9. A repeated dressing of basic slag has, however, had a marked effect in some cases, and the productiveness of slagged pastures that are showing signs of exhaustion can be rapidly improved in this way. The action of a repeated dressing appears to be more rapid in many cases than the action of the first dose.

10. Basic slag put on in the middle of June had much more effect than the same quantity applied in winter.

11. Where a direct comparison has been made between the effects af equal quantities of phosphoric acid derived from basic slag and superphosphate respectively, the former manure has always produced the greater amount of live-weight increase. When the cost of the manure is taken into account the profits from the use of basic slag have always been much greater than those from superphosphate.

12. Potash added to a phosphatic dressing generally resulted in the production of more live-weight increase, but this increase was not a profitable one.

13. The addition of moderate dressings of sulphate of ammonia or nitrate of soda to land already treated with phosphate has increased the yield of herbage, but has, as a rule, reduced the yield of mutton. The use of nitrogenous manures on pasture would, therefore, appear to be bad practice.

14. Dissolved bones compare badly

The Right Building Material for Houses, Barns, Implement Sheds

Whether you are building an implement shed, a granary or a house or barn, the most ECONOMICAL and DURABLE building material is "Metallic."

For Barns: Corrugated Steel Siding and "Eastlake" Metallic Shingles make a barn absolutely fire, lightning and weather proof.

For Houses; Metallic Rock Faced Stone or Brick siding will give your house the appearance of a stone or brick dwelling. It is easily and cheaply applied and very durable. "A 25-year actual test" has proven "Eastlake" Shingles the best roofing.

All about the permanent roof you want is told in our artistic free booklet, "Eastlake Metallic Shingles." Write for it now.

A WEAK ACHING BACK

Caused Her Much Misery.

Mrs. W. R. Hodge, Fielding, Sask., writes:—"A few lines highly recommending Doan's Kidney Pills. For this last year I have been troubled very much with nasty sick headaches, and a weak aching back, which caused me much misery, for I could not work, and had no ambition for anything. My kidneys were very badly out of order, and kept me from sleeping at nights. I tried many kinds of pills and medicines, but it seemed almost in vain. I began to give up in despair of ever being well and strong again, when a kind neighbor advised me to try Doan's Kidney Pills, which I did, and am thankful for the relief I obtained from them, for now I am never troubled with a sore back or sick headaches.

"I will always say Doan's Kidney Pills for mine and can highly recommend them to any sufferer."

Price, 50 cents per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

A GOOD INVESTMENT

is the money spent in securing a training at

FREDERICTON The Business COLLEGE

W. J. OSBORNE PRINCIPAL.

A catalogue of this school giving full particulars will be sent free to any address on application. Address

W. J. OBSORNE - Principal, Fredericton, N. B.

"My little son had a very severe cold. I was recommended to try Chamberlain's Cough Remedy, and before a small bottle was finished he was as well as ever," writes Mrs. H. Silks, 29 Dowling Street, Sydney, Australia. This remedy is for sale by all Dealers.

with basic slag and superphosphate. This is doubtless due to two reasons: (a) the slower action of part of their phosphate, and (b) the presence of nitrogen. But the nitrogen of dissolved bones, being less active than that of sulphate of ammonia, the general effect on the sheep of the dissolved bones has been better than that of a mixture of superphosphate and sulphate of ammonia. The use, however, of dissolved bones on pasture would seldom appear to be justified, and especially so as their phosphoric acid costs more than the same substance in basic slag.

Prevention of Smut in Grain.

During the past twenty years various chemicals have been tested to secure one for the prevention of smut in grain crops. Little difficulty has been experienced in controlling this disease in wheat or in oats, but no practical method has yet been introduced that will entirely prevent it in barley. The formalin treatment has been found, after numerous trials, to be highly satisfactory. Formalin can now be secured almost everywhere; it is inexpensive, the solution is easily prepared, and its efficiency, when properly applied, is beyond doubt. One pound of formalin is sufficient to make thirty-two gallons of solution, and this quantity will easily cover forty bushels of wheat, or about twenty-eight of oats. Dipping and sprinkling have given equally good results, but carelessness in either method of treatment is sure to bring disappointment.

Bluestone has been found effective as a re-agent for destroying smut, but its use has not been attended with quite as satisfactory results as formalin. A bluestone solution of the proper strength is prepared by dissolving one pound of bluestone in six gallons of soft water. As with the formalin solution, it makes no difference how this solution is applied so long as every kernel of grain is thoroughly moistened.

Other treatments that have been on trial as preventatives of smut include those with sulphide of potassium, sulphate of iron, agricultural bluestone, massel powder, anti-fungi, salt and hot water. None of these has proven to be nearly as effectual as either formalin or bluestone. The hot water treatment and the sulphide of potassium both effectively prevented the disease, but the methods of application are too tedious to permit of either treatment coming into general use. Agricultural bluestone and anti-fungi are both mixtures of copper sulphate and iron sulphate, and their effectiveness is dependent upon the proportion of sulphate of copper that they contain, sulphate of iron being of little value as a fungicide.

No satisfactory remedy has yet been discovered for the control of loose smut of wheat. This is a disease distinct from the stinking smut or bunt.

Mice Damaging Orchard Trees.

J. B. D., Annapolis Co., N. S.—I find that mice have damaged some of my young apple trees by partly girdling them. Is there any poisonous preparation that could be placed in the runways which the mice would eat and cause them to cease their depredaeions?

Ans.—Dissolve one ounce of strychnia sulphate in a pint of boiling water, add a pint of thick sugar syrup, and stir thoroughly. The prepared syrup will be more attractive if scented with a few drops of oil anise, but this is not essential. This quantity of prepared syrup is enough to poison half a bushel of wheat; smaller proportional quantities may be used, of course. If, after thorough mixing, the solution is not sufficient to wet all the grain, add a little water. Allow the poisoned grain to stand twen-

TRAMPED 60 MILES TO SAVE HIS CHUM

Prospector at Larder Lake Got Back with GIN PILLS Just in Time.

LARDER LAKE, ONT., MARCH 26th, 1911.

"I am writing to tell you the good GIN PILLS did me. I had been suffering for some time with my Kidneys and Urine. I was constantly passing water which was very scanty, sometimes as many as thirty times a day. Each time, the pain was something awful and no rest at night. I began to feel worn out.

WELCOME RELIEF.

I heard of your GIN PILLS and decided to give them a trial at once. I sent my chum out to get them (about 60 miles) —and I am pleased to inform you that in less than six hours, I felt relief. In two days, the pain had left me altogether. I took about half a box and to-day I feel as well as ever and my kidneys are acting quite natural again. Thanking you for the pills which I always intend to keep by me. Yours respectfully,

SID CASTLEMAN.

We have never received a letter that pleased us more than this one. When we realize what Gin Pills meant to this sick man, lying on a bed of pain miles away from a doctor in the frozen north, and how they helped him, we feel that our efforts to prepare a standard preparation for Kidney and Bladder Troubles have been crowned with success.

GIN PILLS is a wonderful solvent for uric acid. It instantly neutralizes the hot, scalding urine, allays the burning pain, soothes the irritated bladder and heals the kidneys. Take GIN PILLS on our positive guarantee of a cure or your money back. 50c. a box, 6 for $2.50. Free sample, if you write mentioning this paper, The National Drug & Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS are a positive cure for Constipation, Biliousness, Sick Headache and Sour Stomach. Excellent for Indigestion. 25c. a box. 112

ty-four hours, to soak up all the fluid; if then it is too wet, a little dry corn meal will take up the excess of moisture. If the strychnia sulphate cannot be procured, and the alkaloid form must be used, then one pint of boiling vinegar will be required instead of water in which to dissolve it. Small suckers may be cut from branches of apple trees and dipped in the poison; these, if placed on the ground beneath the snow, preferably in the runways; if put on the surface of the snow the mice are not likely to touch it. As a further protection tramp the snow solid around the roots of the trees; the mice will not then work through it.

Feeding Value of Hay.

One of the most important substances in any foodstuff is protein. All nutritive substances which contain nitrogen are classed under the general term of protein. Protein is composed of nitrogen, carbon, hydrogen, oxygen, sulphur and phosphorus. Protein is the substance which builds up the body. The muscles, tendons, ligaments, connective tissues, skin, hair, hoofs, part of the bone, and in fact every part of the body but fat, are made up of protein, together with mineral matter and water.

The next important class of substances is the carbohydrates, which contain carbon, hydrogen and oxygen, but no nitrogen, sulphur or phosphorus; they include starch, sugar, etc. These are used for practically the same purpose for which coal or wood is used in the steam engine, namely, to furnish energy and heat.

The third important constituent of hay is its oils. Small quantities of oil are present in all kinds of hay. These oils serve the same purpose as the carbohydrates. A pound of these, however, will furnish two and one-fourth times as much energy or heat as the same quantity of carbohydrates. It can readily be seen, when the chemical analysis of hay is considered, why the price of the different grades or kinds of hay should depend first, upon the amount of digestible nutrients contained, and, second, upon the purpose for which the hay is fed. If the concentrated feed—i. e., the grain in the ration—lacks protein, then the hay that is high in this substance is more valuable than one which contains little but carbohydrates, and vice versa. There is quite a range in the amount of the different classes of nutrients in the various kinds of hay.

On an average, in 100 pounds of alfalfa hay the digestible protein amounts to 10.58 pounds; in cowpea hay, 10.79 pounds; in alsike clover hay, 8.15 pounds; in red clover hay, 7.38 pounds; redtop hay, 4.80 pounds, and in timothy hay, 2.89 pounds.

In 100 pounds of redtop hay the digestible carbohydrates amount to 47 pounds; in timothy hay, 43.72 pounds; in alsike clover hay, 41.70 pounds; in alfalfa hay, 37.33 pounds; in cowpea hay, 38.40 pounds; in red clover hay, 36.15 pounds.

When fed for protein, timothy hay ranks last, but when fed for carbohydrates it stands next to redtop, which heads the list. If the total nutrients are considered there are a number of different kinds of hay which are equal, if not superior, to timothy hay for feeding purposes.—H. B. M'Clure.

Woven Wire Fennes.

All things considered, a woven-wire fence around the entire farm is more economical in the long run than any other, since it not only keeps all the farm stock right where they belong, but it will last practically a lifetime, thereby saving much repairing and damages incident to keeping up poor or common fences.

"Here is my Letter to You. It is Worth One Thousand Dollars"

DEAR FRIEND:

If you're going to buy a horse, you look at his feet. But if you buy a building, you look at the ROOF last. A horse isn't worth more than his feet, and a building isn't better than its roof.

I want you to roof right. I want you to get the right stuff from me at the right price. I want to make your roof a good deal better than your building, because then you ll get everything out of the building that it can give in shelter, protection and proper storage. The right roof does more than anything else for any building.

My Oshawa Shingles have taken 50 years of my thought and time and invention. It was hard work. I tried to make a perfect shingling. I worked for years to get just the right kind of metal to last longest. I worked to get the easiest and best lockjoint that ice couldn't pry open. I worked and estimated hard to get a roof neither too heavy nor too light. I worked for a time-proof shingling. I have got it for you. It will last 100 years.

When you use this Oshawa Shingle of mine what do you get? First, you get a shingle so good to-day, that it gives perfect service. It suits any building. It meets every kind of need for a roof at low cost and with long service. Second, you pay a moderate price. This is because many buyers unite on using my Oshawa Steel Shingle. The Canadian Government Bernier Arctic Expedition used my shingle against Arctic ice and blizzards. The North-West Mounted Police use it, another Government proposition, against Arctic snow on permanent construction. The West Indies uses it against terrific heat and rain You find it in Japan because it stands earthquakes. My Oshawa roofing is on the farms of South Africa. Here is ONE roof that is perfect in every climate in the world from Arctics to Tropics. World sales are my reward for high quality. Third, you have a roof that is easy to lay and lay right You can lay it and lock it yourself. It will not leak nor burn. It is lightning-proof.

But I want you to pry into every detail of my proposition first. I want you to know it is right I will send you this book of mine, "ROOFING RIGHT," if you send me a post-card I have sent thousands of them out, for they have useful hints on planning barns and houses. The book is worth money to you, and if it leads you to use my Oshawa Shingles, the roof will be protecting your barn one hundred years from now.

Send for this book of mine now, to my nearest address below. If you are about to build a barn, it may have a hint or new idea worth $1,000 easily to you, even if you do not buy a roof. If you do get a Pedlar Roof from me, you get double or triple service from the building. I will be looking for your enquiry.

Yours truly,
(Sgd.) G. A. Pedlar

"Ocean Limited" Featured in English Magazine.

In the April number of the "Boys' Own Paper" an English magazine that for many years has been standard literature for countless thousands of English speaking youths all over the world, there is an interesting article on Canadian Railways, in which mention is made of the Intercolonial Railway's Ocean Limited Express. A half-tone illustration shows this famous train speeding around the shores of Bedford Basin, and there is a description of its fine equipment, the scenery on route and a fitting comment on the average speed maintained, with the information, interesting to British readers, that the Intercolonial Railway is owned by the people of Canada, and operated by the Government. The article is made additionally interesting and instructive by the comparisons made between British and Canadian Railways and the differences that exist in traffic conditions.

Preparing Wool for Market.

(Continued from page 541).

made of the wool of the fleece itself—there is no difficulty—for the use of twine, especially "binder-twine", is most objectionable, because it gets threaded into the wool. (Applause). Having carefully observed the foregoing suggestions, the wool should be neatly piled away in a suitable room, not being allowed to touch any outside wall unless it is one which faces the south, because wool is a material that will absorb moisture where it is possible, and only does so to its detriment in the eyes of the user. Cover the pile of wool with a good cloth of some kind to keep it free from dust, and also, where possible, store it in a place where rats or mice cannot get into it, or carry corn amongst it. They often play sad havoc with the appearance of it by doing this. If you intend to hold the wool for a time, it is much the best to store it in a dark chamber, as the light will make it lose its colour sooner, besides encouraging insect life that sooner or later will appear in the form of moths, that feed upon and destroy the fibre of the wool.

Suffolk Sheep.

(Continued from page 547).

ried out in 1894-6 by the Colonial College at Hollesley Bay—a bleak spot on the East Coast of Suffolk. A few aged Merino ewes were mated with a Suffolk ram, the average produce was fully a lamb and a half per ewe and gave when slaughtered at the age of 15 months an average live weight of 94 lb. per sheep, and an average dressed carcass weight of 54 lb. or 60.64 per cent. The average weight of fleece was 6.56 lb., the length of staple being about 50 per cent. greater than that of the average Southdown, and the wool of equally fine texture. The heaviest wether weighed 110 lb. and yielded 70 lb. or 63.63 per cent. of dressed carcass, and a fleece of 7½ lb. The flesh was of excellent quality, fine in grain and of good flavour with a large proportion of lean meat. The following report was received from a well-known wool expert, Mr. J. W. Turner of Bradford:— "I have carefully examined your sample of Suffolk-Merino wool. Of its kind the wool is most excellent. It has a "soft handle" and is withal quite firm in staple and would make a small proportion of "noil". For wool of its class it could not be beaten."

When the foregoing particulars are carefully considered it must be seen that for general utility and as rent-payers Suffolk sheep have no equal, and if further proof were needed it may be found in the fact that, of the 248 flocks registered in the last volume of the Suffolk Sheep Society's Flock Book, fully 85 per cent. are owned by tenant farmers the majority of whom can only afford to keep such stock as will ensure the most profitable return for their capital and skill, and this fact is also the surest indication of still greater extension in the future.—E. M. Prentice.

Lunenburg County Farmers' Meetings.

Editor Maritime Farmer:—

During the past two weeks, Mr. W. H. Woodworth, ex-President of the N. S. Farmers' Association and Institute Lecturer on Agriculture, has been addressing meetings in Lunenburg County under the auspices of the Lunenburg County Farmers' Association. Although the roads have been bad, the attendance has been greater than at any series of meetings for the past eight years, since the Farmers' Association was formed in this County. The fact of such a large attendance shows that the farmers are beginning to appreciate the efforts that are being made by the Government of Nova Scotia to bring to the farmers of this Province a wider range of knowledge relative to their business as tillers of the soil.

At West Northfield and Hebbville, the ladies came with well-filled baskets and after the lecture served sandwiches, cake and hot coffee. We believe this is a move in the right direction and hope that other localities will follow their example. The farmers are convinced that the subjects treated by Mr. Woodworth are of great importance and that if farming is to be successfully prosecuted, it must be done along the line of scientific principles. The speaker discoursed on the use and abuse of commercial fertilizers, and advised the farmers in buying mixed fertilizers to buy high grade goods in preference to the low grade material. He also said it was profitable to buy the chemicals and mix them at home. The conservation of soil fertility occupied part of the time at each meeting. The fact that wire grass and daisies in many localities are seen in abundance is a sure sign of poor farming. By making the farm a factory where the raw material is manufactured into beef, lamb, pork and butter and by practising a short rotation of crops the aspect af the fields will soon be changed and a better quality and a more abundant crop of hay the result. The price of farm products remains on a paying basis and conditions are more favourable than in the past. In a short report it is not possible to give an idea of the subject matter of these lectures, it is therefore important that in future each farmer make it a point to be present.

Number of meetings addressed, 11.

Total number present, 780.—J. L. DeLong, Secretary.

Your Delight

in Quaker Oats is its flavor. In no other oatmeal has it ever been equalled. Note why.

By 62 siftings we pick the rich plump grains. We get but 10 pounds of Quaker Oats from a bushel.

Those grains have the flavor, and our process retains it. The result is this unique oatmeal.

Every morning millions enjoy it. And it costs them only one-half cent per dish.

Why does anybody serve to their children any lesser grade of oatmeal ?

Thoroughpin.

E. M. S., Pictou Co., N. S.:—What is the best treatment for thoroughpin?

If the lameness has passed away, leaving only the puffy swelling, or in

cases where a swelling has appeared without lameness, as the result of work or as a dropsical effusion similar in character to the bursal enlargements popularly known as wind galls, it is usual to recommend pressure. This can only be effectively applied by means of a specially constructed spring truss. Sometimes this proves useful, but very often it does no good. In recent cases, where there is lameness due to sprain, the indications are a high-heeled shoe, complete rest, in which the shoe assists by relieving the strain on the parts, fomentations or cooling lotions, and a smart dose of physic. When heat and tenderness have subsided, it is usual to blister, or fire, and even then there is generally a puffy swelling remaining. Puncturing the sac, and a special operation which is, if memory serves, known as Flintoff's operation, are sometimes practised, but as a blemish is a blemish, whether it is a puffy swelling or acicatrix or scar, the thoroughpin causing no lameness is generally best left alone.

Segregating Healthy Animals.

Resolution 6 of the report of the International Commission on Tuberculosis deals with the separation of healthy and diseased animals and the construction of a healthy herd by the process of segragation. It is one of the most important parts of the report and defines a plan by which it is possible to clean a herd of tuberculosis without putting it entirely out of business. The plan suggested is not a new one, however, and has been worked out satisfactorily in some countries, especially in Denmark. In the main it consists of separating the healthy from the diseased animals in a herd and keeping them isolated until all traces of the disease have been eliminated, the object being to prevent infection of the healthy animals and to keep the diseased animals under such conditions as may prove effective in bringing about a cure. Where a herd is extensively infected it is recommended that no separation method be followed, but that the construction of a new herd only from the offspring is advisable. The great objection to this plan has been that it could only be undertaken by the more wealthy cattle raisers, who are in a position to provide the necessary facilities. Experience in Denmark does not, however, bear this out. Reports of the working out of the Bang system, as this segregation method is called, show that ordinary farmers, with no greater facilities for the purpose than the farmers of this country have, worked it out satisfactorily and with very gratifying results. Before any effort was made to stamp out tuberculosis in Denmark, the cattle of that country were said to be more tuberculous than those of any other country in Europe. To-day, alter several years' careful application of this system, the cattle of Denmark average higher than those of other countries in their freedom from tuberculosis.

Intensive Farmer.

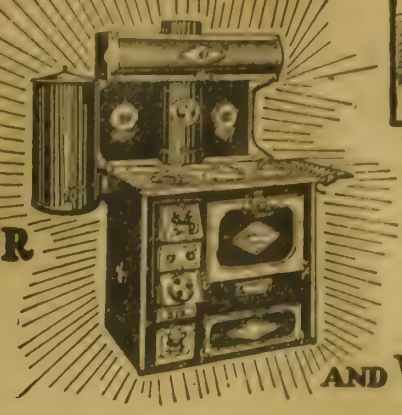
We nave borrowed this jingle from a journal which borrowed it from some other journal. As a sarcastic comment on intensive farming, it is good:

They used to have a farming rule
Of forty acres and a mule.

Results were won by later men
With forty square feet and a hen.

And nowadays success we see
With forty inches and a bee.

DIRECT FROM FACTORY TO KITCHEN

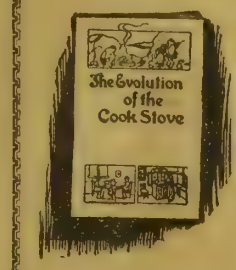


SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.
$41.00 TO $49.00
AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price
Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of tough, strong, malleable iron and the best blue polished steel—materials which will not warp, crack or break.

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it saves over 30% of fuel, burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. If not convenient to pay cash we will arrange to accept your note.

Saves You Time and Money

Some Intresting Figures.

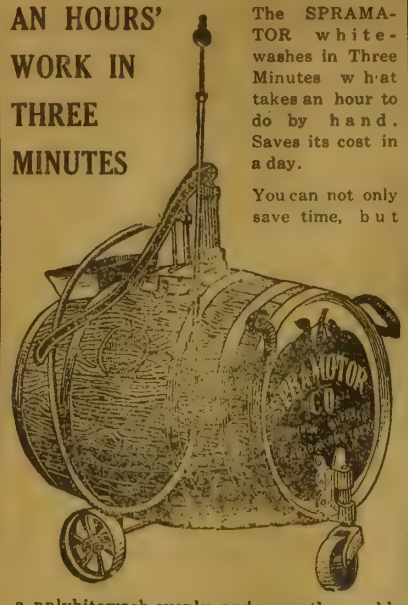
In Farmers' Bulletin No. 469, just issued by the United States Department of Agriculture, we find, under the heading, Market Milk, some interesting figures and among them those giving the value of the manure of a dairy cow. The figures are taken from experiments conducted by Prof. W. J. Fraser of the Illinois Experiment station, and are as follows:

The manure is figured at 11 tons per head for cows producing 8,000 pounds of milk. On the 20-acre dairy farm at the university last year cows which were kept in the barn during the winter and in dry lot during the summer produced 13 tons of manure per cow. The average value is considered at $1.50 per ton. At the Illinois Agricultural Experiment station, on a three-year rotation of corn, oats and clover, manure has increased the crop yield $1.60 for each ton of manure used, figuring the market value of the crops, for the first three years after it is applied. No consideration is taken of the increased production from the effects of the manure after the first three years. At the Ohio Experiment station the value of the crop yields has been increased $2.34 for each ton of manure used. From the figures above stated, $1.50 a ton is a conservative value on cow manure which has been well cared for. Cows which produce less than 8,000 pounds of milk will produce, on the average, less than 11 tons of manure. Cows producing more than 8,000 pounds of milk will not only produce more manure, but it will be of a better quality, owing to the fact that they are fed more concentrates. For these reasons the value of the manure is lowered 50 cents per cow for every 1,000 pounds' decrease in production of milk below 8,000 pounds, and raised 50 cents per 1,000 pounds' increase in production above 8,000.

AN HOURS' WORK IN THREE MINUTES

The SPRAMATOR whitewashes in Three Minutes what takes an hour to do by hand. Saves its cost in a day.

You can not only save time, but



apply whitewash evenly, and more thoroughly than in any other way, driving the paint in every crack and crevice.

It is easily handled and runs about smoothly in any direction. Nothing to get out of order, and no mechanical knowledge required.

10,000 sold in past five years. Forty tons of paint applied by N. Y. C. Ry. to Buffalo stockyards by the SPRAMOTOR method. THEY KNOW! Write for 88 page free booklet to-day. Paint formula and all directions with machine.

Every Farmer His Own Painter.

Any man can do an average job of painting, and can thereby not only improve the appearance of his place but can add greatly to the durability of the buildings. Many a farmer seems to think that paint is used solely for ornament. He is of all men most keenly practical, and he eschews what he regards as an unprofitable luxury. It is perhaps the rule rather than the exception in some sections to see houses and agricultural implements sadly in need of repainting. Of course paint does improve the appearance of property, but it is far more useful as a protector rather than an ornament. The expenditure of a small amount of money and time in painting a valuable piece af farm machinery or a building will add greatly to the length of its life. Another useful object accomplished by painting is the improved sanitary condition of buildings and outhouses. The cost of such work is small, the necessary equipment not expensive, and with proper care will last a long time.

In order to supply information which will enable the farmer to purchase paints economically and apply them intelligently and to the best advantage, Secretary Wilson caused experts in the U. S. Bureau of Chemistry to investigate the subject and prepare Farmers' Bulletin No. 474 calling attention to the economic importance of painting farm buildings and equipment and giving details as to the cost, purchase, and care of brushes, cost of the ingredients needed, how to mix and apply them. Paint conveys to the casual reader the idea of a mixture of pigment with linseed oil, but the general conception of the word includes both whitewash and calcimine, but not varnish, and the bulletin gives several very valuable recipes for making both of those excellent coatings for both the out and inside of buildings.

The secretary in addition to urging the proper use of paints for both useful and ornamental purposes advises not to use any paint containing compounds of lead about stables or outbuildings where the fumes from decaying organic matter occur, since these gases are likely to darken the lead paints. Do not use with lead compounds any pigment which may liberate compounds of sulphur. For example, ultramarine blue white, containing sulphur in a form in which it may be set free, is a beautiful and very permenent blue and may be used with zinc white, but should not be used with white lead or any other lead pigments. Prussian blue, on the contrary, does not contain sulphur and may be used with lead pigments.

Turpentine and benzine are very inflammable and especial precautions should be taken not to bring paint containing these substances near any light or open fire. Many pigments are poisonous, and the workman should be particularly careful to remove all paint stains from the skin, and not under any circumstances allow any of it to get into his mouth. A man should not eat in the same clothes in which he has been painting, and before eating should not only change his clothes but wash all paint stains from his skin. It is not advisable to use turpentine or benzine in removing paint stains from the hands but by oiling thoroughly with linseed oil, or, in fact, with any fatty oil, and then thoroughly washing with soap, the paint may be removed, provided it has not been allowed to dry too thoroughly on the hands.

The 40c Package Makes Over 200 Cups.

RED ROSE TEA "is good tea"

207

You will be proud of the bread you'll make with PURITY FLOUR

AFTER seeing a batch of big, golden-crusted, snowy-white loaves, that you have baked from PURITY FLOUR, you will, indeed, be proud of your cooking-ability—and proud of your wisdom in deciding to pay the little extra it costs to procure such high-class flour. You will admit, too, that we are justified in the pride we take in milling this superb flour.

PURITY FLOUR

"More bread and better bread"

PURITY FLOUR is milled exclusively from the best Western hard wheat—the world's finest. More than that, PURITY FLOUR consists *entirely of the high-grade portions of the wheat.* The low-grade portions are separated and excluded during the PURITY process of milling. Such high-class flour, of course, expands more in the baking. It makes "*more bread and better bread.*"

It makes lighter, flakier pastry, too, if you just take the precaution to add *more* shortening. On account of its unusual strength PURITY FLOUR, for best results, requires more shortening than ordinary flour.

Progressive dealers, everywhere, sell PURITY FLOUR and take pride in recommending it.

Add PURITY FLOUR to your grocery list right now. 106

FLORICULTURE.

H. A. G., writes:—I have a Tulip bed on the south side of my home and this winter, to my surprise, I discovered that the bulbs next to the house wall were started to a height of two inches. They were covered with litter and brush. Should I remove this covering?

It is unfortunate that these bulbs should have started so soon as no doubt the balance of the bed is frozen solid. Do not remove the brush but a portion of the litter may be scraped away, so that the frost will check the growth but be sure and keep them well covered from the sunshine.

Those forcing bulbs for early flowers, in the home, should have them up to the light now; and don't forget to keep them moist.

Ferns and Palms should be repotted soon, especially Ferns, as the spring growth has begun and if they are crowded at the roots the new growth cannot be healthy.

I have inquiries: If Red Begonias will grow from seed? Will the pods that form on a plant in the house have seeds in them? How are these plants usually grown, also are foliage plants grown from seed and if so, where can they be obtained? I know they grow from seeds but I am told that one gets new varieties from seeds.

It is possible to grow Red Begonias from seed but very difficult and one would have trouble to get seed. The pods on house plants very rarely contain seed and if they did its fertility would be problematical. Better start plants from cuttings as the florists do. Each leaf makes a good cutting. Cut the stems about two inches from leaf and trim the edges of the leaf until only about two inches about the crown of the stem is left. Place in wet sand and keep moist continually. This leaf will apparently wither and die but if patient a new growth will appear at the crown of the stem and the cutting can be potted in a small pot. Keep out of direct sunlight but give light and warmth and never allow cuttings to dry out under any condition.

By "foliage plant" I infer that the writer means the common varieties of colors, which are easily grown from seed which is sold by all the larger seed houses. It is very interesting to grow colors from seed as one gets so many odd and sometimes pretty types. It is well to pot quite a number of the seedlings as only a very few will be of any use and you cannot tell anything about them until a few inches high. The smallest and tenderest seedlings are more apt to make good varieties than the stronger ones which are nearly always so coarse as to be of no value. Sow seeds in shallow pans or boxes of sandy soil, cover with glass.

General Spraying Directions.

The essentials for successful orchard spraying are:—

(1) Spray intelligently. The sprayer should have a general knowledge of the more important insect and fungus pests. Unless a man knows exactly what he is trying to fight or prevent, he is apt to waste much time, labor, and spraying material. For particulars of the life history and habits of the more common orchard pests, see Part 8 of Bulletin No. 4, and read the same thoroughly. Those who have not this bulletin, may obtain it on application to the Department of Agriculture, Fredericton, N. B.

(2) Promptness is absolutely necessary. For those spraying applications which commence with the first signs of growth in the spring, delay is fatal. In most cases, at that time of the year, one might as well not spray at all as put it off for two, three, four days or even more. The object of a fungicide is to prevent and not to cure. Practically all fungicides should be applied before the disease appears so as to prevent its lodgement and are successful only when they prevent infection. While this is not so true in the case of insects, it is important not to delay spraying for them, since when they are well established and more fully grown, they are very difficult to control.

(3) Absolute thoroughness in all phases of the work. Many growers do their work in a half hearted way and then complain of poor results. In spraying for fungi it is absolutely necessary to entirely cover every portion of the tree, and in fighting insects, every individual must be reached. Every portion of the tree should be thoroughly moistened with a fine mist or spray in order that a uniform coating of the same may be left on the tree. The owner of the orchard, who, presumably, is the man most anxious to get good results from spraying, should not trust the work to ordinary labor, but he should do it himself or personally supervise it, unless he has very reliable help.

(4) Spraying solutions must be properly made. Standard made commercial lime-sulphur such as that prepared and sold by The Niagara Spray Co., The Grasselli Chemical Co., and other concerns, are reliable and only need dilution as per Part 3, Bulletin No. 4. The best makes of lead arsenate have proved so far to be the most satisfactory and most reliable poison for spraying apple trees, either with or without lime-sulphur.

(5) Spray every year. In some seasons fungi and insects are not very numerous and the fruit grower is then strongly tempted to save the expense and trouble of spraying, but it is a great mistake to do so. The spraying done in years when insects and fungous pests are scarce counts in the years when they are plentiful because the effects of proper spraying are not all harvested in the first year.

(6) Use a strong durable pump fitted with the best attachments. A No. 2 hand pump fitted to a cask of 40 gallons capacity, with 25 ft. ¼ inch hose, 10 foot bamboo rod, stopcock, hose connections, and double nozzle, will meet the requirements of most of the orchards in the province at the present time.

HOW TO SPRAY.

Spraying should in nearly every case be done with the wind. When spraying the first side of large trees, stop the wagon or spray cart just as it comes within a few feet of the tree and spray the nearest side as far in and as completely as the spray can be driven; then, drive directly opposite and spray all the central part thoroughly; then, move just past the tree and spray the last part as far in as possible. In this way, nearly two-thirds of the tree will be covered and when the wind changes it will be easy to complete the spraying from the other side. A very strong wind no doubt wastes a little of the mixture, but it is very seldom that there is any need of ceasing operations because of its violence. In spraying small trees it will not be necessary to stop so long at each tree. Go through the orchard as soon as the spray has dried on the trees and if you notice limbs or portions of the trees here and there that have been missed, it is well to take out the machine and give these spots an application of the spray mixture. In spraying after the foliage has appeared, people are often misled by the advice that is given to cease spraying just before the leaves begin to drip. It is impossible to spray a large or medium size tree thoroughly without a coosiderable amount of drip; hence, the first rule to follow is:—(1) Make sure that every leaf and fruit is covered; and, (2) Try to do this with as little material as possible.

IHC Engines Furnish Plenty of Power

WELL as you know your ordinary farm power needs, you can never tell just where you are going to need extra power, and need it badly. An engine with ten to twenty per cent of reserve power will often save enough to pay for itself, just by its capacity for carrying you safely through emergencies.

I H C Gasoline Engines

are large for their rated power—they are designed to run as slowly as possible because that increases their durability. They are equipped with a speed changing mechanism which enables you to vary the speed at will. By changing the speed they can be made to develop from ten to twenty per cent over their rated power with little detriment to the engine, and at a cost for extra fuel so slight that it will never be noticed on the bills for gasoline. As soon as the need for extra power is gone, the engine should be slowed to normal speed.

When you buy a gasoline engine, buy one you can depend upon; one that has plenty of power, one that is built to operate at lowest cost for fuel and maintenance. Buy an I H C engine—1 to 50-H. P., vertical or horizontal, water-cooled or air-cooled, stationary, portable, or mounted on skids, built to operate on gas, gasoline, kerosene, distillate, or alcohol Kerosene-gasoline tractors in all styles from 12 to 45-H. P. Sawing, pumping, spraying, grinding outfits, etc.

See the I H C local agent and get catalogues and information from him, or, drop a line to the nearest branch house.

I H C Service Bureau

The purpose of this Bureau is to furnish, free of charge to all, the best information obtainable on better farming. If you have any worthy questions concerning soils, crops, land drainage, irrigation, fertilizer, etc., make your inquiries specific and send them to I H C Service Bureau, Harvester Building, Chicago, U S A

HARROWS

In these days of expensive labor you can't afford to buy any Harrow but the one which will do your work best and quickest—'twon't pay you.

Our Lever Harrow is a great one; best there is going by long odds. It will harrow steadier, and just to what depth you want it. Then you can regulate the draft on the horses and get the greatest amount of work for the least pulling.

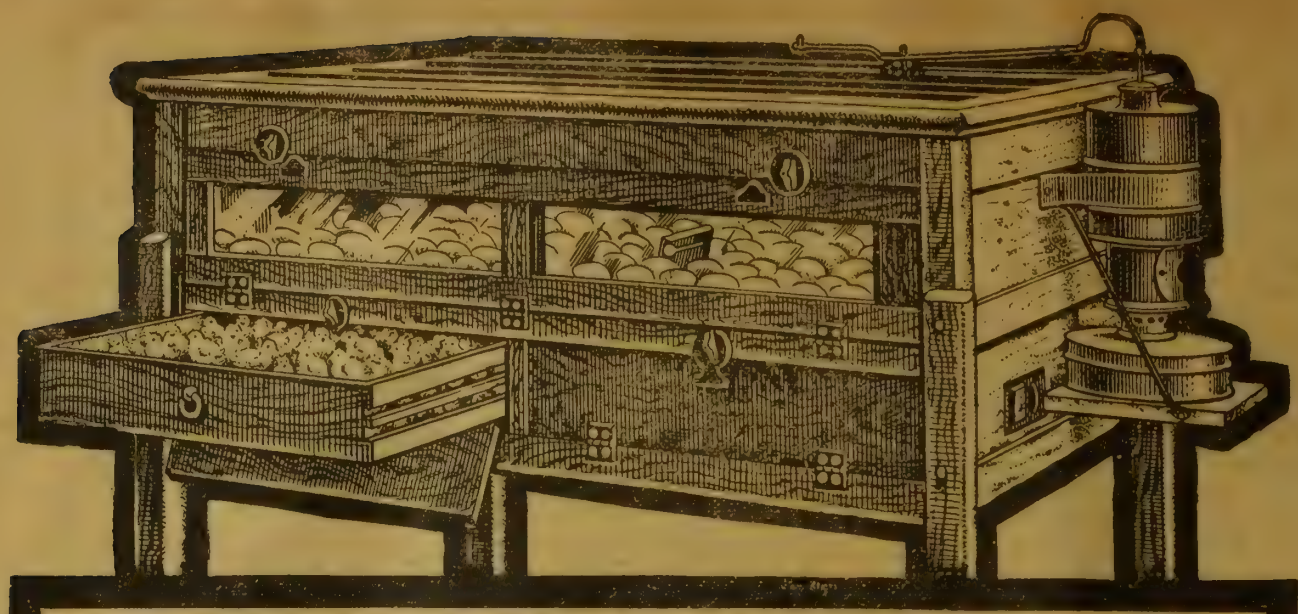
A touch of the levers and the teeth are just where you want them at each round; not too deep at first, to ease the horses, then afterwards when the top soil is loose, throw them down and your getting something done.

Saves time bocause less scrapes do. Made in sizes 9 and 11 Tooth, Single Section. 15 and 17 Tooth, Double Section.

BAILEY-UNDERWOOD CO., Limited. New Glasgow, N. S.

Agricultural Advancement in Newfoundland.

A deputation of the St. John's Agricultural Society waited upon the Board of Agriculture recently and pointed out the need of lime for the land and asked for a grant of $1,500 towards the erection of an agricultural lime-kiln. More sheep and ponies were also needed and a good laboratory for instruction in the science of agriculture, in connection with the Department of Agriculture and Mines; and the Board have promised to do their utmost in these directions at once. Already arrangements are being made by the Board for the securing of lime at a greatly reduced rate from the new lime kiln at Port au Port, so that prospects are brighter for the farmers.

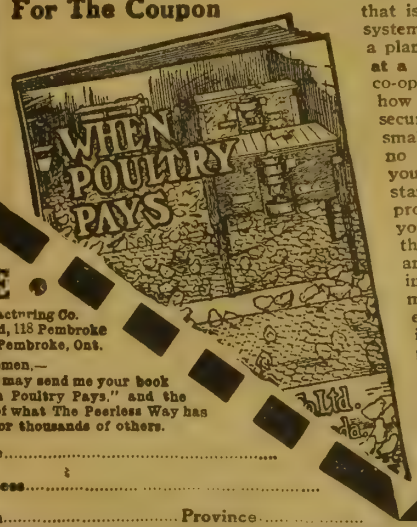


THE PEERLESS INCUBATOR AND THE PEERLESS WAY HAVE DOUBLED THE PROFITS OF 20,846 FARMERS

ANY farmer can raise "poultry-for-profit" on the same plan and under the same conditions as we do it at the Poultry Yards of Canada, Limited, and make just as big a success as we have made of this, the largest and most profitable poultry farm in the Dominion. You can do it. You can put to work for you The Peerless Way and the Peerless Incubator and double or treble your profits right from your first month. Over 20,846 Canadian poultrymen have proven this. By following our system, they are making their poultry pay them greater profits than they ever dreamed was in the business.

THE book, "When Poultry Pays," tells what hundreds of followers of The Peerless Way have accomplished. It tells why the price of eggs doubled in seven years it tells about a market that exceeds the supply by 200%;—it tells about a plan that is more than merely a system of poultry-raising—a plan that raises poultry **at a profit**; it tells about co-operative marketing—how the highest prices are secured in either large or small quantities; and, by no means least, it tells you exactly how to get started in this field of profits that lies right at your door. You will find this book full of facts and figures and other information that will make you open your eyes to the real profits in poultry. **Do not put it off. There is no time like the present. Send for the book NOW.**

Send For This Book—FREE For The Coupon



LEE Manufacturing Co. Limited, 118 Pembroke Road, Pembroke, Ont.

Gentlemen,—
You may send me your book "When Poultry Pays," and the proof of what The Peerless Way has done for thousands of others.

Name.....

Address.....

Town..... Province.....

We Will Show You The Best Way To Start.

YOUR start is important; without experience or guidance, you can badly handicap yourself in the beginning. It may take years to overcome a bad start. The Peerless Way will put your first step on the right road to success, will show you the incubator and brooder that meets the climatic conditions of Canada's cold winters, and will furnish you with plans, blue-prints and complete specifications of poultry houses, etc., that are actually being successfully used today in Pembroke at the Poultry Yards of Canada, Limited.

We Will Show You How To Get Better Prices

THIS alone is a valuable part of the service included in The Peerless Way. We guarantee to find for all your poultry products, buyers who will pay you the highest spot-cash prices and who will charge you no commission for the service either. You do not need to be dependent upon the middleman and cold-storage buyer when you understand co-operative marketing. You do not need to give away part of your profits; the last few cents on every deal is your own "velvet"—and goes into your own bank account.

You Can Learn At Home or Come To Pembroke—As You Prefer.

THE Peerless Way, combined with the free, personal advice of our Poultry Advisory Board, will make poultry-raising profitable for you. If you will take the Peerless Incubator and Brooder and just follow the plain, explicit directions of The Peerless Way, step by step, you cannot go astray. Or if you prefer it, you can come to Pembroke and, on payment of a small tuition fee, take a course of personal instruction at the Poultry Yards of Canada, Limited.

The Home Vegetable Garden.

(Continued from page 539).

the proper time in spring, very little labor is necessary in the preparation of a seed-bed for the early planting. Soil containing sufficient humus to grow vegetable srops advantageously, can be fitted for planting without the use of hand tools, if the precaution is taken to work it at the exact time it reaches the right degree of dryness. It will then crumble readily, and a seed-bed can be prepared by the use of a disk, harrow, and planker. The use of these tools saves an enormous amount of labor, and is a vast improvement over the old method of using a hoe and rake.

PLANTING.

The actual planting of the garden is a simple matter, provided a definite plan has previously been made, so that no time is lost in deciding which vegetable to plant first, where to plant it, or how much to plant. In the home garden, only a small amount of seed of each kind is planted, so that a seed drill cannot be used to advantage, and the planting is therefore almost invariably done by hand. For the small vegetables, sown in drills, the planting involves four distinct operations: (1) making the drills, (2) dropping the seed, (3) covering, and (4) firming. The most rapid way of making tne drills in a garden to be planted in long rows is to use a marker that makes three or four drills each time it is drawn across the area to be planted. With a medium weight marker, and the soil in proper condition for planting, the marks will be of the proper depth for planting seeds of any of the smaller vegetables usually sown in drills. For peas or beans a deeper drill may be made with the plow attachment of a wheel hoe. After the seed is dropped, it is covered with a rake, or in the case of deep planting, with a hoe, or a wheel hoe. The soil is firmed over the seed by the use of the feet, the back of a hoe, or a garden roller. Whatever the means employed, the firming must be thorough, especially in light soil or dry weather; for unless the soil is brought in close contact with the seeds, they will not germinate.

LABOR SAVING METHODS OF TILLAGE.

Labor saving methods can be employed in the care of the growing crop as well as in the preparation of the seed-bed. Mention has already been made of the desirability of planting the garden in long rows so that horse tillage may be introduced. By the use of a narrow-tooth cultivator, it is possible, with a steady horse, to work fairly close to the rows of even small vegetables. However, for the early tillage close to the rows of beets, onions, carrots and similar crops, there is nothing equal to a wheel hoe; and throughout the season this tool can be largely substituted for the hand hoe. Its use will result in a great saving of labor. Labor will also be saved by cultivating the garden frequently and keeping the soil in good friable condition, rather than tilling at less frequent intervals and allowing the ground to become baked before it is tilled after a rain. Timely tillage means easy tillage and the most favorable conditions for growth, while untimely or infrequent tillage means difficult tillage and less favorable conditions for growth.

HOW TO REDUCE THE LABOR OF HAND WEEDING.

The most tedious labor in the ordinary garden is the hand weeding of the small vegetables. By proper management of the garden a large amount of this labor can be eliminated. One way to avoid excessive labor in hand weeding is to keep weed seeds out of the garden as much as possible, by avoiding the use af manure containing such seeds, and by destroying all weeds in and about the garden before they go to seed, even if they appear after the crops are harvested. But in spite of all that can be done there will always be weed seeds present in garden soil. The way to prevent these from producing weeds that are larger than the vegetable plants and endangering the life of the latter, is to keep them from starting growth before the vegetables have a chance to start. This is done by thoroughly working the soil immediately before the vegetable seeds are planted, thus killing any weed seedlings that are about to appear above the surface, and giving the vegetables an even start with the weeds that may develop from seeds germinating later.

Still another way of reducing the amount of hand weeding is to cultivate very close to the rows with a wheel hoe as soon as the vegetable seedlings appear. In the case of slow germinating crops, like carrots and parsnips, it is wise to sow a few radish seeds along with the other crop, for the sake of marking the row so that tillage may begin before the plants from the slower germinating seeds are visible. This leaves only a narrow strip of soil unstirred, and hence very little space in which weeds can grow. If the weeds which appear in this narrow strip are pulled when they are quite small, little difficulty will be experienced in keeping weeds from interferring with the growth of the vegetables; and the amount of labor involved in the hand weeding will be relatively small. If the weeds are allowed to become large before an attempt is made to remove them, the growth of the vegetables is checked both by the presence of the weeds and the process of removal, and the later involves much more labor than if the weeds are removed at the proper time. Nearly all the vegetables grown in drills require thinning, and if precautions are taken to prevent the early starting of weeds, as above outlined, most of the necessary weeding can in many cases be done at the time of thinning, and thus one operation be made to serve both purposes.

VEGETABLES CLASSIFIED ACCORDING TO CULTURAL DEMANDS.

Although the assortment of vegetables in an ideal garden would include many crops not of the easiest

USE DR. WILSON'S DERBY CONDITION POWDERS

FOR HORSES, CATTLE, PIGS and SHEEP If your dealer does not carry it write to THE BRAYLEY DRUG CO., LTD., ST. JOHN, N. B.

culture, nevertheless in a farmer's garden it may, under some circumstances, be the part of wisdom to reduce the labor of caring for the garden, by refraining from attempting to grow some of the crops that demand special care or conditions, or an unusual amount of labor. Unless the farmer is prepared to meet the demands of the given crop, the results with that crop are likely to be unsatisfactory, and the labor involved in its care unrequited. It is therefore desirable to know the particular needs of the various crops, in order to determine whether it is advisable to attempt to supply the needs of a given crop in a given garden, or to leave its culture to those more fully equipped to meet its demands.

VEGETABLES REQUIRING RICH SOIL AND MUCH TILLAGE.

While nearly all garden crops respond readily to copious applications of plant food, there are certain crops which are especially emphatic in their demands for a rich soil, and wnich it is impossible to grow to perfection unless the soil is, or can be made, very rich. This group of crops includes cabbage, cauliflower, celery, eggplant, onions and melons. In the case of melons it may be unnecessary to fertilize the entire soil area, if the ground immediately surrounding each plant is made very rich.

There is also a great difference in the amount of tillage demanded by the various crops; that is, in the extent of neglect they will endure, and still produce a fair crop. The crops that require an extra large amount of tillage, and that will likely be utter failures without it, are the same as those already mentioned as demanding an exceedingly rich soil.

VEGETABLES SUBJECT TO INSECT ATTACKS.

The labor of caring for certain crops is also greatly enhanced by the necessity of combating the insects that prey upon them. There are many of our garden crops which are occasionally subject to slight or even severe attacks of certain insects, but with which we do not usually anticipate trouble. There are other crops that are invariably attacked by insect enemies, and usually to so serious an extent that, unless means of control are employed, the crop will likely be a complete failure. The vegetables belonging to this group are the vine crops (including the cucumber, muskmelon, watermelon, pumpkin and squash), the eggplant, late cabbage and cauliflower. Unless careful attention can be given these crops at critical times, attempts to grow them will likely lead to disappointing failures.

VEGETABLES REQUIRING SPECIAL HANDLING.

Some crops demand special training or other manipulation to enable them to grow to the best advantage or develop the most desirable product. Common Lima beans and tall growing peas require artificial support in the form of poles and brush or wire netting respectively. Except in a region where native timber is abundant it may be inconvenient or expensive to provide these supports, to say nothing of the labor of preparing and installing them. Therefore, it may be advisable in some cases to resort to the use of dwarf varieties exclusively.

Other crops demanding special handling are cauliflower, leeks, celery and endive, all of which require blanching to develop a satisfactory, edible product. In the case of the cauliflower, the head must be protected from the sun by tying the leaves or otherwise securing them over the top. Endive likewise is blanched by tying up the outer leaves so that the inner portion of the plant will be protected from the sun. With both these crops, the blanching plants must be closely watched, so tnat they may be used when they have reached the right stage of development. Leeks and celery are usually blanched by hilling up with earth, though an early crop of celery is sometimes blanched by means of boards placed edgewise along the row. When earth is used, care must be exercised to avoid getting dirt down in the "hearts" of the plants, and repeated bankings are necessary. This is a somewhat laborious process unless a person is equipped with special tools, and at best there is much labor and expense involved in the production of a good crop of celery.

VEGETABLES REQUIRING TRANSPLANTING.

The labor of growing some crops is enhanced by the necessity of transplanting. The crops usually transplanted are cabbage, cauliflower, celery, eggplant, pepper, sweet potato and tomato; and an early crop of any of these sorts cannot be secured without it, for the seed must be started under glass long before the weather is suitable for planting these crops in the open. The making and care of the hotbeds in which the plants are usually started entails considerable labor, as well as the process of transplanting. Late crops of cabbage and tomatoes are sometimes grown from seed sown where the crop is to mature, and late cauliflower and celery may be started in carefully prepared seed beds in the open, thus obviating the labor involved in the care of a hotbed, though considerable attention to the seed bed is necessary.

VEGETABLES OF EASY CULTURE.

It would seem, then, that various difficulties are likely to be encountered in the growing of a number of the common vegetables, owing to their special demands as to richness of soil or frequency of tillage, their susceptibility to insect attack, their need of aetificial support or provisions for blanching, or the necessity of transplanting. While the list of vegetables with special demands along one or more of these lines includes a number of the garden's choicest products, nevertheless there are a large ndmber of crops which have no special soil requirements, grow fairly well without much tillage, are usually not subject to serious insect attacks, and do not require transplanting or special handling of any kind. This group includes asparagus, dwarf string beans, dwarf Lima beans of the Sieva type, beets, carrots, chard, sweet corn, garden cress, kale, kohl-rabi, leaf lettuce, mustard, okra, green onions grown from sets, parsley, parsnips, peas, radishes, salsify, spinach and turnips—twenty-one different vegetables. All these are of comparatively easy culture, and can be successfully grown by any one who will give a little attention to the proper time of planting each crop, and a reasonable amount of care during the growing season.

It is true that if a person confined his planting to the group of crops just mentioned, his garden would be far from complete; and such a procedure is not advised. It is well to know, however, what vegetables can be relied upon to produce a crop under almost any conditions of soil and care, and to supplement this list with such of the other crops as can most readily be grown under the conditions surrounding the individual gardener, and with the facilities at his command.

THE Keeley Cure

FOR LIQUOR AND DRUG USING

Over Thirty Years of Success Due to Honesty, Safety, Certainty.

The Keeley Remedies have been administered for more than THIRTY YEARS and are recognized by the public at large, as well as the medical profession, as being the most efficacious treatment known for the diseases which they are designed to overcome.

We have cured thousands of veterans of the War of the Rebellion in the National Soldier's Homes of the country, whose ages range from fifty to eighty years.

We have cured several children under five years of age who were adicated to morphine and opium, such adictions having been acquired through the mother's own addication or direct administration. No constitution is to delicate for the Keeley treatment, as the remedies are perfectly harmless.

We have cured hundreds of soldiers in the Regular army of the United States, and have letters from officials of all ranks, from major generals to lieutenants, commending the Keeley Cure in the highest terms.

We have cured Senators, Congressmen, lawyers, clergymen, businessmen, merchants, laborers, men of all occupations, and of no occupation, to the number of over 400,000. Among them 20,000 physicians.

The treatment removes all craving or desire for liquor or drugs, restores the nervous system to a normal condition, clears the brain and makes a man out of a nervous wreck.

Patients are not confined; there is no irritating or vexations restraint.

There is no Nausea or other Sicknesses attendant upon or caused by our treatment. Improvements begin at once and continues throughout entire course of treatment.

We have special accommodations for ladies, where they can be entirely exclusive, and can be treated as privately as in their own homes.

Printed matter and particulars by mail in sealed plain envelope.
All letters promptly answered and treated strictly confidential.

N. S. Fruit Growers' in Special Session.

A large and representative number of Fruit Growers met at Kentville, on April 12th, to hear the Report of the Delegates to the Fruit Conference at Ottawa, and to listen to addresses from prominent men on live fruit questions of the hour.

President S. C. Parker took the chair and called on John N. Chute, of Berwick, the "Father of Co-operation in the Valley," to tell of the present status of co-operative work, and what development was looked for.

Mr. Chute took up his subject from a business standpoint, and briefly reviewed the work and growth of the co-operative movement for the last five years. He showed that the question was not a local issue, but a world-wide movement, in which producers everywhere were finding a way to improve their condition, and place their products on the market in the best possible manner. In his own company at Berwick the average price for the seven leading varieties, for the past five years had been as follows:— No. 1, $2.64; No. 2, $1.88 and No. 3, something over $1.00 per bbl. Twenty-five companies were now organized in the "Valley." A Central Association was organized and had started work the past season. Nearly $300,000 worth of business was done this first year, which speaks volumes for what can be done when companies are all working together. The Central Association can handle he question of transportation, can attend to the buying of fertilizers, and other supplies and in many other ways assist the local companies. In fact the Central Association should be to the local companies what the local companies are to the individual.

Mr. Chute's address was worthy of the careful attention it received.

Dr. Cutten, President of Acadia University, spoke on the benefit a Meteorological Station to the Fruit Growers of the "Valley." It was found by experiment that the temperature and rainfall of the preceding year had a great effect on the various crops of the year following, and by keeping a careful record for a term of years, of the precipitation, high and low temperature, frosts, winds, etc., data of great value to farmers and fruit growers could be secured. Some work had been done along this line at Wolfville, and the late government had sent instruments which had not been installed, and the new director from Toronto seemed to be under the impression that the Station was not needed. Dr. Cutten read a letter from the State Climatologist of Ohio, giving an account of the work there, and the benefits derived. After some discussion of the location of such a Station in the Valley the following resolution was carried.

Whereas, valuable results have been obtained in other Countries by ascertaining and recording for future guidance, complete local meteorological records,

And, whereas, the close connection of monthly temperature and rainfall with crop production is a matter for the fullest investigation,

And, whereas, some work of this nature is now being carried on at Wolfville,

Therefore resolved, that this Association respectfully request and urge upon the Federal Government, the expansion of this work and the equipment of a complete station from which daily weather forecasts may be furnished to farmers and fruit growers by mail, telephone, telegraph, signals or otherwise of such a nature as to warn them of injurious frosts or high winds during the growing season, or probable temperatures to be met with by fruit in transit during winter.

Capt. Allen, the delegate from the United Fruit Companies to the Ottawa Conference gave an account of the work in the Conference upon the standard barrel question. "If" he said, "Canada cannot accept one size barrel, would it not be better to adopt two standards, the 96-quart bbl. as used in Nova Scotia and the 112-quart bbl. as used in Ontario?"

G. H. Vroom, the Dominion Fruit Inspector, read the law which called for a minimum barrel as follows:— 26½ inches inside measure between heads, diameter of head, 17 inches, diameter of bilge, 18½ inches. Mr. Vroom then exhibited three sample barrels, of standard length, but varying in diameter of bilge, No. 1, 18½ inches, No. 2, 19 inches, No. 3, 19½ inches. They held 97, 99, and 101 quarts respertively. No. 1 was the right size for the present minumum barrel, but in practice it was found not strong enough, because of the small bilge. He suggested, a head diameter of 16⅝ inches and a bilge of 18½ inches as a better barrel.

The Secretary read some correspondence from Mr. McNeill, Chief of the Fruit Division, quoting the law as to the minimum barrel and saying that this coming season the law in respect to size would be strictly enforced and fruit growers and coopers should take notice and govern themselves accordingly. A lively discussion followed and much old straw was thrashed.

Mr. P. Innis, presented the following resolution which was passed by the meeting.

It is resolved that, the Resolution passed at the last Annual Meeting regarding the Standard of Measure for apple barrels of 96 quarts or 3 bushels, be adherred to.

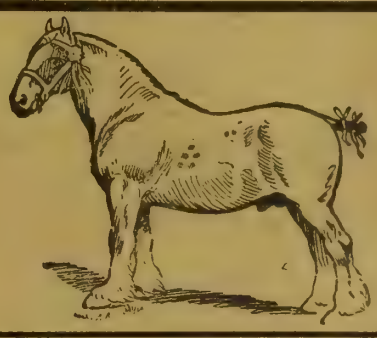
Further that, any change in the shape of the apple barrel that does not increase the capacity to over 3 bushels, and is mutually agreed to, will be acceptable, and

Further resolved that, every person manufacturing apple barrels shall stamp their name and "Standard Apple Barrel" on each barrel, and shall be liable on summary conviction to a penalty of twenty-five cents for each barrel they make of lesser dimensions than the legal specifications.

At the evening session, President Parker on behalf of the Chairman of the Ottawa Delegation, who was not present, gave a report of the work done at Ottawa. The Minister of Agriculture had promised great things for the Experiment Station at Kentville. He spoke of the question taken up at the Conference and asked Capt. Allen, who represented the United Fruit Companies, and J. N. Chute, to also speak on points that had come to their attention.

Capt. Allen, took up the transportation question, and with facts and figures showed up the S. S. lines carrying apples in relatian to three contracts with the Government. To draw their subsidy of $25,000 the Furness line should maintain a twelve knot service, ten days crossing the Atlantic. He had records showing that some boats took as long as 18 days on the way while hardly any lived up to the contract for speed. It was thought that the advent of the C. P. R. would help matters a little, but instead they had only made them worse. The facilities for landing apples in London from the C. P. R. steamers were very poor and they had combined with other steamship lines to keep up freight rates.

Mr. Chute, reported on the Inspection of Apples, and the question of a Minimum Size for No. 1 and No. 2. This latter he regarded as of great importance. The Ontario delegates wished to class the Spy with the larger apples, but agreed to a lower standard. The Conference recommended a minimum size for the different varieties as follows:— Golden Russet and kindred varieties, 2⅜ No. 1, 2¼ No.2; Baldwin, Spy, etc., 2¼ No. 1, 2¼ No. 2; King, Wolf River, etc., 2⅜ No. 1, 2¼ No. 2. The Ontario and



Be Wise And Progressive

ALL wise Farmers are now feeding MOLASSINE MEAL, the Horse, Cattle, Pig and Poultry Food.

If you have not used it, your neighbor has. Ask him about it.

New Brunswick is progressing. Catch the progressive spirit and raise better Live Stock by feeding MOLASSINE MEAL. The Farmers who do so are progressing.

MOLLASSINE MEAL is made in England. Your dealer handles it because he knows it is the best Feed obtainable.

MOLASSINE MEAL is not a medicine but a Feed.

L. C. PRIME COMPANY, LIMITED

Distributors.

St. JOHN, New Brunswick.

other delegates agreed that the system of instruction as to the place of operation was faulty. If it could be carried on to some extent at the warehouse, people would soon learn how to pack better apples. The Conference had agreed to recommend two sizes of barrel, as legal for the Dominion.

Mr. Gornall, of Middleton, closed the meeting by a very interesting and instructive address on the marketing side as it appears to an observer in England. Wasteful methods were followed and co-operation on this side in packing and marketing was the only solution. He urged the need of special representatives of the United Companies on the other side to look after their interests and to advise as to shipments and state of the markets.

Meeting then adjourned.—Report of the Special Meeting of the N. S. F. G. Association, held at Kentville, April 12th, 1912.—M. K. E.

Potato Scab.

Much work has been done on this malady. A popular presentation was made in Experiment Stations' bulletins may be summarized as follows:

This well-known malady is the result of a fungus infestation, which also causes scab on beets and possibly on the roots of other vegetables. It is probably not a native. Its germs occur in great numbers on scabby potatoes, and may cling to the surface of smooth tubers. Much of the loss from scab is directly due to the use of infected seed. When the fungus is not present in the soil a clean crop is assured if clean seed is used. Soil conditions may be favorable or unfavorable to its development. Certain varieties of potatoes are more liable to scab than others. Prevention or control should aim at the selection of resistant varieties, keeping the soil free from the fungus and disinfecting the seed potatoes. It is cheaper to abandon potato growing upon badly infected soil for a time than otherwise to combat the pest. If the soil is free from the fungus any method of fertilizing is safe, but if infected, alkaline fertilizers are to be avoided. Chemical disinfection of soil is not effective enough to warrant the cost. Seed potatoes are disinfected either by soaking one and a half hours in a solution made by dissolving 1 ounce of corrosive sublimate in 7 gallons of water; or by soaking two hours in a solution made by diluting one-half pint of formalin in 15 gallons of water.

Extensive trials in 1900 led to the statements that:

1. A scabby crop ensued when scabby seed was used on a scab free soil; that
2. A clean crop followed the use of a clean seed on clean soil; that
3. No seed disinfection availed if a badly infected soil were used; that
4. The fungus may persist in the soil for a long period of years, whether cropped with potatoes or not; that
5. While corrosive sublimate and formalin are both effective, the latter is more convenient and non-poisonous to stock; that
6. Formalin should be used but a day or two before planting; that
7. Corrosive sublimate, on the contrary, should be used two months before planting; that
8. Flowers of sulphur as a disinfectant or in the row proved ineffective; that
9. Exposure to sunlight for four weeks before planting greatly reduced the scab and hastened the growth of the tubers; that
10. Sulphurous gas used as a disinfectant gave indeterminate results; that
11. Formaldehyde gas proved superior to either corrosive sublimate or formalin.

SPRAY! SPRAY! SPRAY! SPRAY!

Before the Leaves Come Out

It is safe to apply the dormant spray with the end of the leaves showing fully half an inch, with NIAGARA LIME-SULPHUR and SWIFT'S ARSENATE OF LEAD, using 4 gallons of the former and 2½ lbs. of the latter to a 40 gallon barrel.

The poison will kill the Bud Moth which works such great destruction as the leaves are coming out and later in the summer rolling the leaves up.

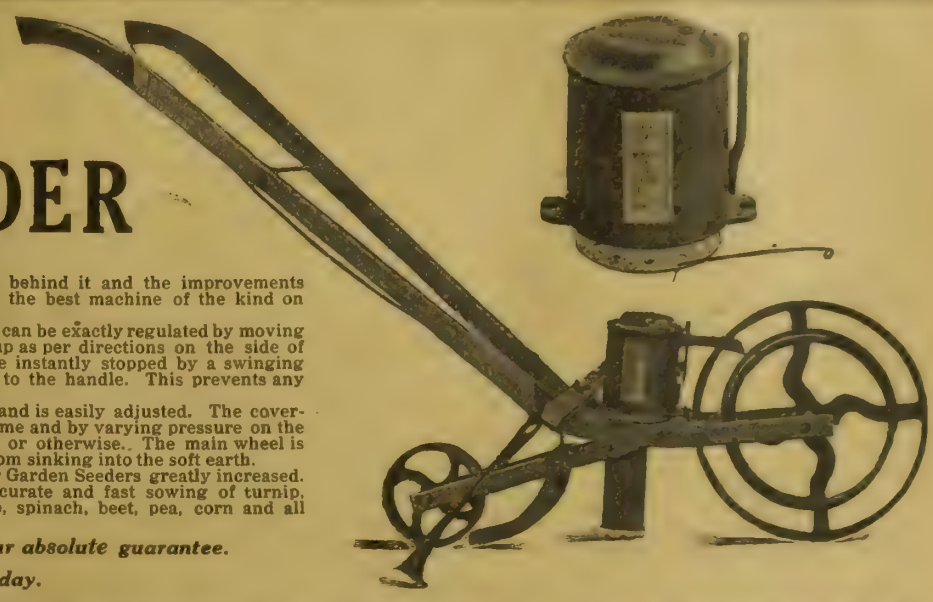
The early spray not only Insures a CLEAN crop of apples but a surer set of fruit.

The Cornell Experiments proved that omitting the early spray cost 16 times the quantity of fruit.

Niagara Spray Co. of Nova Scotia Limited,

KENTVILLE, Nova Scotia.

GARDEN SEEDER



Our Seeder has years of success behind it and the improvements recently added, makes it without doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. The flow of seed can be instantly stopped by a swinging cut-off operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our Garden Seeders greatly increased. No better seeder can be built for accurate and fast sowing of turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seed.

Every machine carries our absolute guarantee.

Send us your orders today.

The Sussex Manufacturing Co. Limited, Sussex, N. B.

ROOT CROPS FOR FARM STOCK

We make a distinct specialty of **ROOT SEEDS,** and are careful to see that our stocks keep pace with all the advancements being made from year to year. Anyone wanting the best should insist on

Steele, Briggs' "Royal Giant" Sugar Beet.
Steele, Briggs' "Prize Mammoth Long Red" Mangel.
Steele, Briggs' "Giant Yellow Oval" Mangel.
Steele, Briggs' "Giant Yellow Globe" Mangel, and
Steele, Briggs' "Giant White Sugar" Mangel.

No other Root crops produce so large an amount of desirable cattle food for winter feeding. **Insist on having them—they're the best—refuse substitutes and others said to be just as good.**

STEELE, BRIGGS SEED CO LIMITED
WINNIPEG HAMILTON TORONTO

Report of Horticulturist for 1911.

The report of the New Brunswick Horticulturist for 1911 together with the seventh annual report of the Fruit Growers' Association, is issued this year as a separate document and is now ready for distribution. It contains 130 pages of reading matter and 28 pages of illustrations. Fruit Growers should find much of interest in those pages dealing with the demonstration orchards, the orchard survey work, apple insects, and fungous diseases and spraying directions. There is also an interesting account of the work in horticulture accomplished by Francis Peabody Sharp, New Brunswick's pioneer horticulturist. The full and complete list of the prize winners at the 1911 apple show is also given. Copies may be had free of charge on application to the Horticulturist, Fredericton, N. B.

Demonstration Orchard at Westfield.

The New Brunswick Department of Agriculture has taken hold of the orchard of C. R. McKenzie at Lingley, in the Parish of Westfield, Kings County, for demonstration purposes. This orchard consisting of some 58 trees over thirty years of age, mostly of the Fameuse and Alexander varieties, is especially suitable for an object lesson in the renovation and management of old bearing trees, as it is plainly in view from both the railway and the mainroad. The large number of people passing to and from St. John cannot help but bring the work performed in this orchard very much to the public notice. The trees have already been pruned and prepared for the first spraying which will be made early next week.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

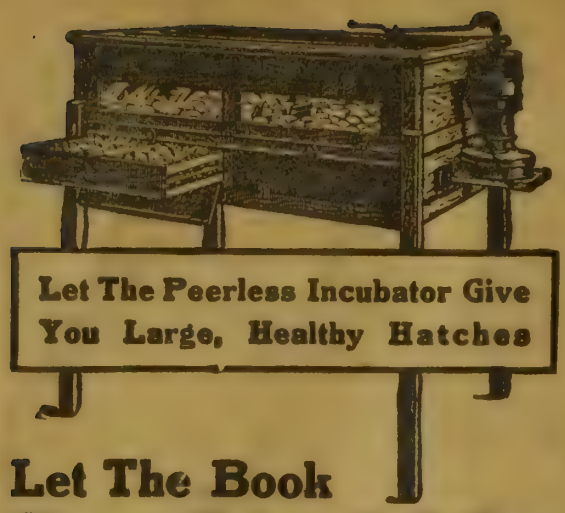
ADDRESS

S. J. GOODLIFFE, - Sussex, N. B.



LET THIS INCUBATOR AND THE PEERLESS WAY MAKE POULTRY RAISING YOUR MOST PROFITABLE BRANCH OF AGRICULTURE

YOU can do it—can do just what 20,846 other farmers and poultrymen have done and are doing in Canada to-day. You can adopt The Peerless Way, take the Peerless Incubator and Brooder and with the experience that we have spent years in acquiring and which we offer you freely, double or treble your poultry-profits. Per head of population, the United States produces three dollars of poultry products to every dollar's worth produced in Canada. That means Canada should produce $75,000,000 worth instead of $25,000,000 worth. Canada is an under-supplied poultry market with rising prices—for example, seven years has seen the price of eggs alone just doubled. We have been so blinded with big things in Canada, that we have overlooked how really immense some of the smaller things are. The Peerless Way affords a real way to increase poultry-profits.

Let The Book Shown Below Tell You How The Peerless Incubator And The Peerless Way Can Double Your Profits

WE publish a handsome book which tells all about The Peerless Way. This book, "When Poultry Pays," must not be confused with The Peerless Way. It does not contain the plans, working-drawings, specifications and blue-prints that go with The Peerless Way. But it does explain—and fully—just how you can put The Peerless Way to work for you. It gives statistics showing the condition and possibilities of Canadian poultrying; tells how the Peerless Incubator and Brooder were evolved at the Poultry Yards of Canada, Limited, and how these and other things we learned about Canadian poultrying, made our own farm the most successful of its kind in Canada; and it tells, further, the story of a poultry system that is revolutionizing poultry raising in this country. The book is too expensive to send out haphazard; but if you are interested in "poultry-for-profit," have a little money, the average amount of common-sense and the willingness to look after your business, send us the coupon and we will send you one copy. Remember, we are not offering you any "something-for-nothing," or "get-rich-quick" plan; but we are offering a straight, legitimate, business proposition, which, if you go into it seriously as it deserves to be gone into, can double and treble your profits from poultry, and raise it from a side-line of your farm, to your most profitable branch of agriculture. Do you care to—

Let The Peerless Way Teach You Exactly What Profitable Poultrying Really Means

THE profits in any enterprise don't come from the amount of capital invested; profits come from knowledge of what to do—and, even more important—what not to do. As operators of the Poultry Yards of Canada, Limited, the largest and most successful poultry farm in the Dominion, we are prepared to teach you how to make money in poultry. You can either come to Pembroke and take a course at our poultry farm here by paying a small fee for the course—or we will teach you through the mail free all about the methods we have made so successful.

Let The Peerless Way Show You How You Can Meet The Climatic Conditions of Canada In Poultrying

OVER half the failures in poultrying in Canada are due to improper methods. Incubators, brooders, poultry-houses, etc., built for warm climates, never have and never will give, in the cold winters of the Dominion, the full possible results. The Peerless Way is the only system of poultry raising that gives recognition to this important fact. The Peerless Incubator and Brooder has been specially designed and built for Canadian use and the blue-prints and working-drawings furnished for the erection of poultry houses, are made from houses that have actually been used and proven successful on our own poultry farm at Pembroke.

Let The Peerless Way Show You About Co-operative Marketing And Higher Prices

MORE money for your poultry and eggs—that's the secret of greater profits! To followers of The Peerless Way—those 20,846 poultrymen who use Peerless Incubators and Brooders and have adopted our methods,—we have taught co-operative marketing. We have shown them how to get top-notch prices for large or small quantities of poultry or eggs, and how to sell to the best advantage. Working along the lines that we have proven to be so successful, is making an increased revenue from poultry. You, too, can have the benefit of all our experience; for our Poultry Advisory Board is ready to teach you all these things. They are ready to give you freely all the experience that has taken them years of toil and exhaustive study to acquire, ready to set you in the right track and enable you to make profits right from the minute you start. But there is not room here to tell you all about it—the book will do that. Send us the coupon and we will send you, postage paid and without charge, "When Poultry Pays".

THE Keeley Cure

Positively Cures Alcoholic Inebriety, Opium, Cocaine and Other Drug Addictions

IF YOU MUST DRINK

before you can do business, if you have that feeling that you cannot eat, sleep or concentrate your mind on your work until you have a drink of liquor, you are not normal. And if abnormal, you are diseased. You are a victim of the disease of inebriety. This does not necessarily mean that you are often carried home drunk, or even that you stagger, but it means that your nerve cells have been created and have lived under the influence of alcohol until they cannot perform their functions naturally and painlessly except under its influence, and because your nerve cells are not performing their functions—your mind is sluggish, you concentrate your thoughts with difficulty and forget things you should remember, you are subject to attacks of melancholia and depression, when anything goes wrong, you probably have a capricious appetite and what you eat is not well digested. You suffer extreme nervousness and many other symptoms of the disease.

Now, the Keeley treatment cures inebriety by restoring the nerve cells to a healthy condition, toning up the whole nervous system. All craving or feeling of necessity for stimulants disappears because normal, healthy nerve cells do not need artifical stimulation. They are able to perform their functions without it. The improved conditions are evidenced by the return of a normal appetite, renewed mental activity and quiet, restful sleep, a disposition to settle down to the proper kind of life, to enjoy one's home and family, and live a life of contentment and happiness.

The methods and treatment are without shock, inconvenience or harmful tendencies, and the patient passes from the addiction to a cure so easily and comfortably that he hardly realizes that he is the subject of medical treatment.

The treatment removes all craving or desire for liquor or drugs, restores the nervous system to a normal condition, clears the brain and makes a man out of a nervous wreck.

Patients are not confined; there is no irritaing or vexatious restraint.

There is no Nausea or other Sicknesses attendant upon or caused by our treatment. Improvement begins at once and continues throughout entire course of treatment.

We have special accommodations for ladies, where they can be entirely exclusive, and can be treated as privately as in their own homes.

Printed matter and particulars by mail in sealed plain envelope.
All letters promptly answered and treated as strictly confidential.

Better Hay-
Easier Work-
More $ $

If you grow upwards of ten acres of hay a year it will be to your profit to get these machines. Quit loading by manual labor, and adopt the improved methods provided by the **Champion** Side Delivery Rake and **Champion** Hay Loader.

The **Champion** Side Delivery Rake would save a lot of time for you. And the hay would be cured better, because the **Champion** throws it into loose windrows so that the wind can easily blow through it.

The **Champion** Hay Loader is so sure and quick in operation it makes loading by fork seem extravagant waste of time. Puts up the hay just as fast as you can handle it on the load.

If the weather is threatening, necessity demands speed in getting the hay into the barn. Many's the time farmers have been saved from suffering heavy losses from storms by the quick work of the **Champion** Hay Loader.

Let us send you our Haymaking Catalog. In it you will find many more reasons why it is the height of wisdom to make this **Champion** investment.

Here Are Two

Haymakers

CHAMPION
Side Delivery Rake and Hay Loader

Nearly three-quarters of a century's experience in making farming machinery for Canadian farmers has given us a very thorough knowledge of conditions that farm implements are required to meet in all sections of the Dominion. That we also know how to build machines that will successfully meet Canadian conditions is evidenced by the great reputation of the Frost & Wood Line.

The name Frost & Wood is associated with RELIABILITY, and with the most advanced methods of farming. It stands for progress. It also stands for Quality—and a large measure of it for every dollar you invest on a Frost & Wood machine. Satisfaction goes hand in hand with greater profits for those who use Frost & Wood Quality Machinery.

Is the Dairy Shorthorn Possible?

By F. M. Chapman, in Farmer's Magazine.

"I SELECTED this tribe of Shorthorns as superior to all other cattle, not only as small consumers of food, but as great gowers and beef grazers, with the finest quality of beef, and also giving a great quantity of very rich milk."

So wrote in 1842 that remarkable man of Shorthorn fame, Thomas Bates of Kirklevington, England, in reference to his justly famed creation of "Duchess" Shorthorns.

And herein lies our subject. Are Dairy Shorthorns possible? Is the Shorthorn cow the best cow for our general farmer on our Canadian farms?

We claim that the general purpose Shorthorn is the only solution for the shortage of beef, and the ills of abnormal farms.

Why? Do not our dairy breeds answer for the dairy end, and do not our beef breeds satisfy our beef consumers?

Let us bring the case into Court. Our readers will form the jury.

Is there anything wrong on the farm? It is admitted on all sides that we are short in good beef.

Our article on "The Fight for Good Beef," in the January issue, answered this question.

The situation is more acute now. Beef cattle are scarce. Stockers are not to be had. Our ranchers are about cleaned out in Canada. The West has, comparatively speaking, no cattle. Mr. Simpson Rennie, of Toronto, the well-known farmer and lecturer, only last week in an interview said: "We have been brought to the verge of famine conditions in beef, owing to the great developments that have been taking place along dairy lines, as well as other factors."

The "Old Kitties" That Won in the 30 Day Test at the Pan-American. Descended from the Importation from England by the Hon. Henry Clay, of Kentucky in 1838.

Rose of Glenside. Record 18,075 Lbs.

NO QUARREL WITH DAIRY BREEDS.

We have no quarrel with the special dairy men. They are doing a good work, and are making money for thousands of farmers. There is no finer settle ment of well-to-do-farmers than live in South Oxford, Ontario, where some $2,000,000 was produced last year from a farm area of about 213,000 acres.

Had the dairy industry not prospered, the wonder would be great. They are assisted by the Canadian Government to the tune of nearly $100,000 a year, as one of the officials at Ottawa remarked during the recent live stock convention.

Their breed societies have pushed an enterprising fight on rational lines. They have gone after the individual cow and made her "show the goods." As a result, they have, under intelligent and expert management, done things.

WHERE THEIR EXAMPLE HAS HURT.

They are open to our criticism in two ways. They have led the general farmer to cross with a dairy sire, his old shorthorn stock. A mongrel nondescript is the result—"no good for beef, and precious little use at the pail," as the average Canadian cow's milk-yield will show.

As we have contended before, the Holstein and the Ayrshire are special dairy breeds. They require specialized men to handle them. The average farmer cannot use them, and especially their crosses, for milk alone. He wants beef, too.

They are not for the indifferent man or the small mixed farmer and in his hands they have been a hindrance to his farm.

Again, in their race for milk yields, the forcing of the breeds to unnatural conditions and tuberculous animals. Dr. Rutherford noted at Ottawa recently that their tuberculous pork was coming largely from those districts where high-class dairying was carried on, and where the milk fed was not pasteurized. He who runs may

read. It is not only in Denmark where there is something wrong. So much for our objections to the spread of the special dairy cow to the mixed farming centre.

Go to the stockyards at Winnipeg or Toronto, and note the stuff that comes in from the average mixed-farming districts. It is enough to cause a lamentation! Such mixtures of colors and shapes. Such uninviting frames for meat production! Must we have a ramshakle skeleton in order to attain milk records?

By no means should a dairy sire be on the shorthorn cows of our country. The big, handsome 1,500-pound cow of our father's day gave the milk—yes, beat out the majority of these be-draggled looking apologies of to-day, and made good beef at the last.

PERHAPS PROOFS ARE WANTED.

But has the Shorthorn cow made good on these farms?

She has, and can still do so!

She was the pioneer cow of older Canada. She gave the settler butter, cheese, rich cream and milk for all his needs. She raised a sleek calf, that later produced the juicy steaks for the pioneer muscles of yesterday.

R. J. Phin, of Moosomin, Saskatchewan, told the men at the Live Stock Conference that the West wanted these pioneer cattle. Thousands of farmers in that wheat country would like the big, old, Durham cows of a former age to assist them in their work, but that they could not get them.

"Had we had these cows," said he, "we would not be bearing so much of a shortage of beef. Our West can easily support 500,000 more cattle and do us good and give to the feeders the kind of stockers they need."

PRESIDENT WHITE'S REMARKABLE ADDRESS.

Mr. Peter White, K. C., the able president of the Shorthorn Breeders' Association of Canada, at its last meeting made a remarkable address. Remarkable for the way he called their attention to the needs of the country to-day. He placed his subject fairly before the breeders. His conclusions were too sound to evoke a single criticism. He said:

"To-day the bonanza beef business is a thing of the past. The settlers all over the North American continent (with the exception of Texas, and even there there is a shortage of 200,000 head) have driven the rancher to the wall. Only a few herds of any considerable proportions remain.

"The beef growing of the future must be done, it seems to me, both in the West and in the East, and this is where the good old red white and roan will come into her own. No other breed can do what the Shorthorn can do, namely, pay her way handsomely in the pail, raise a lusty calf that can be fed off at a good price and she herself, when one of her daughters is able to fill her place in the herd better than she ever did, take on flesh rapidly when dry and go to the block a good carcass, while making profit for her fortunate owner.

"It seems to me to be a policy of wisdom to set our house in order, now, by paying a little more attention to the milking qualities of our cattle and not being satisfied with beef form alone, I mean in the best ones, so that when the demand comes as come it surely will, we will be ready to reap the rich rewards that are our due."

REAL PROOFS FROM ENGLAND.

In order to show what Shorthorn cows can do we have only to look to England where the Dairy Shorthorn produces seven-eighths of all the milk consumed in the great city of London.

And this on the high-priced lands of the Old Country. Are these farmers blind to their own interests?

The majority of us will agree that they are a shrewd bunch of men. They retain the Shorthorn because she is making good. She is doing things. We will instance only a few of the yields from Shorthorn cows in England, but there are sufficient to prove our case. Note also the look of the cow—not the wedge-shaped small-bodied big eating apology seen on many mixed farms of to-day.

Lord Rothschild's Darlington Cranford 5th has a record of 101,746 pounds of milk in 10 years, an average of 10,174 pounds a year. That does not look like a poor producer over a long period. She also produced 11 calves in this time. Eaglethorpe Amy 5th, owned by Samuel Sandy, of Cheshire, produced under test 86 pounds in one day, 568½ pounds in one week and 13,240 pounds in one year besides raising a fine calf and being dry 44 days.

Red Rose A, in the same herd produced 13,188 pounds in 303 days, while Red Rose 11,860 in 277 days. So much for English cows.

Dairy Shorthorns knee-deep in red clover pasture.

The Shorthorn Possesses the Quality of Putting Beef on Quickly. This is the Grand Champion Cow at Chicago, 1911.

SOME ENGLISH RECORDS.

Mr. R. W. Wade, B. S. A., of O. A. C., Guelph, kindly sends me the following yields of milk for a Shorthorn herd at Cranford, England 1910-11. The reader will note the age of the cows so as to refute the argument put up by some that the Shorthorn cow is good only for a few months during her early life.

There was a total of 32 cows in this herd, which averaged 10, 032 pounds of milk.

	Year of Birth	Last Yield in lbs.
Wild Cranford 4th	1902	12,166
Oxford Alma	1902	10,078

Red Rose 13th	1905	10,642

CAN EXCEL IN MILK YIELDS.

One of the greatest names in English Shorthorn breeding, by whom the deep-milking qualities of the breed were fostered, was Jonas Whitaker, a Quaker cotton-spinner near Leeds in Yorkshire. Between 1820 and 1840 he sold many of his cows in America, and many of the Ohio Valley farms' foundation stock were obtained from him.

That the Shorthorn can give satisfactory returns in milk yields as well as in butter is still evident from the report just to hand from the dairy herd of H. E. Crawford, at Ash, in Kent. During last season, which was an unusually hard one, owing to the dought, he kept the milk records for 41 cows. Their average yield was 692 gallons (about 6,900 pounds).
pounds). As the milk was retailed to the consumer direct at 32 cents a gallon, the average cow in this herd gave a return of $221.

The best record for the year was made by a Shorthorn cow, "Snowball," which was 50 weeks in milk, and gave a yield of 1,192.2 gallons. Another Shorthorn, in 55 weeks, gave 1,030 gallons, while still another gave 1,025 gallons in 44 weeks. A cross-bred gave 943.5 gallons in 40 weeks, and another cross-bred 907 gallons in 46 weeks.

The Jersey "Granny" yielded 734.5 gallons in 46 weeks, while a Jersey grade gave 814.7 gallons in 44 weeks. The best Holstein in the herd gave 755 gallons in 35 weeks.

UNITED STATES EVIDENCES.

Mr. A. H. Tryon, manager of the Glenside farm at Granville, Central Pennsylvania, in reply to our inquiry has given us some figures of their herd of pure-bred Shorthorn cows. This farm is the home of the champion producer among Shorthorns, Rose of Glenside making 18,075 pounds of milk in 1909-10, which produced 735 pounds of butter. The records were taken by The Pennslyvania State College. He says:

"Under normal farm conditions, Belle Clare, half-sister to Rose of Glenside made 15,215 pounds in 1910-1911 and Charlotte B, sold to Mr. Knapp of Watervliet, Mich., made a record for the latter gentleman last year of 15,401 pounds and 706.68 pounds of butter.

"Probably the records of Jennie Lee and Margaretta Clay show the most remarkable persistency. Jennie Lee made a record of 10,484 pounds and an average for eight consecutive years of 8,450 pounds, and Margaretta Clay made a year's record of 10,043, and an average for eight consecutive years of 8,426.

"These records have been made almost entirely under normal herd conditions. There is no doubt but that many of our cows could make much larger records if handled along the lines pursued by the strictly dairy breed owners, but we claim that the Dairy Shorthorn is the best general purpose cow for the general farmer and are endeavoring to demonstrate this fact by pursuing the general farm methods which is the only just test."

THE VERMONT STATE WIN.

At the Vermont State Fair, 1911, a competitive two days test of Dairy Shorthorns vs. Jerseys was made. It was conducted under the supervision of Prof. Hills,of the State Agricultural College at Burlington.

Three Shorthorn cows, Red Rose, Doris and Nancy Lee 2nd, made a total of 11,693 pounds of butter as against 9,178 by the next three Jerseys.

The Glenside herd has made 123 records of over 8,000 pounds by their cows and heifers since 1910.

Since March 1, 1910, seven cows and heifers in the herd have completed yearly records over 10,000 pounds, including Rose of Glenside, 18,075 pounds; Belle Clare, 15,215 pounds and three four-year-old heifers.

I quote this herd so far because they have made an attempt to prove to the world that the Dairy Shorthorn is possible and they have done it. That the farmers are waiting for such cattle is evidenced from the fact that demands for them are over two hundred per cent.in advance of two years ago.

PRODUCE BUTTER CHEAPER THAN JERSEYS.

Prof. Carlyle, of Wisconsin, was another witness to the value of Shorthorns for the general farmer. He found that she could produce butter cheaper than the Jerseys and Guernseys and could rear a beef calf besides. In fact the case has been proven a great many times in the United States.

Prof. C. F. Curtiss, of Ames, Iowa, writes me as follows: "Sander's History of Shorthorn Cattle contains two illustrations of Shorthorn cows in the Iowa State College herd. College Moore made practically 1,700 pounds of butter in four consecutive milking periods. I have some of the offspring of this cow in my own Shorthorn herd and the milking quality has been transmitted through a number of generations. I am enclosing a clipping concerning the Shorthorn bull,Scotland's Crown, imported for the College herd a few years ago. While I was in Scotland at the time we made the purchase of Scotland's Crown, I had his dam, Scottish Belle,tested. She was at that time suckling a Shorthorn bull calf that had been put on to her after Scotland's Crown had been nursed for over six months. She was then about thirteen months in milk and tested nearly one-half pound of butter per day after nursing the two calves mentioned."

Many other interesting state contests might be quoted previous to 1910 showing the ability of Shorthorns to excel in dairy production. A glance at Chapter 23 of Sander's History of Shorthorn Cattle will bring evidence that ought to convince the most skeptical.

The Aberdeen Ideals of Beef Form.

WHAT ABOUT CANADA ?

The breeding of milking Shorthorns in Canada has been carried on by individual breeders in many parts but no outstanding breeder has taken the pains to record his work beyond a few at the Guelph show during the past few years. The reason is apparent. The beefing qualities of the Shorthorns have been held up above all other qualifications in Canada of late years and so it was hard to purchase the right kind of cows or to breed them to the right kind of bulls.

Mr. W. C. Good, of Brantford, has a small herd of grades of which he is keeping records to obtain cost of feed He is making a good showing under average farm conditions. He has grade Shorthorns that last year with very little grain feed produced 7,457 pounds, 9,882 pounds and 7,395 pounds. A creditable record indeed. E. C. Drury, of Barrie, is making good account with a general purpose herd.

A. W. SMITH'S VIEWS.

Mr. A. W. Smith says:—"One of the reasons for the pre-eminence of the breed for so many years has been their good milking qualities. And undoubtedly the Shorthorn is the cow for the general farmer. He wants cows that will produce calves that he can make into choice beef and at the same time give as large a quantity of good milk as possible and the Shorthorn unquestionably can fill the bill.

"So much has been said about the dairy form of the good milker that it is difficult for many to get away from their idea that the more angular, ill-shapen and homely a cow was, the better prospects of good milking qualities. Without any doubt one can expect good milking results from a motherly looking cow with plenty of character, but that also is the type of cow from which one expects and gets the best calves.

"To occupy the field open for him and awaiting him, the breeder of Shorthorns must I think keep up the high standard for beef production and at the same time have as good milkers as is possible and it is possible to have very high-class milkers. Not only possible but quite easy and yet retain best beef type.

'A record performance would be a very great assistance as indication to those wishing to improve milking qualities when they could be found."

Mr. M. CUMMINGS' IDEAS.

"The establishment of Record of Performance puts too much premium on the milk alone and not enough on the fleshing qualities." writes Principal Cumming of Nova Scotia.

"The Central Experimental Farm at Ottawa, the Macdonald College, Quebec, and one or two other Stations have, in a small way, conducted some work along these lines, but we are of the opinion that this work should be increased and that larger herds should be established, which would give the private breeder more confidence in himself should he think of striking out along the same lines.

"If we had the ma ter in our own hands, we would establish a new Book for Dairy Shorthorn cows and we would adopt such rules in regard to registration as would admit from England many of this class of cows which are to-day ineligible to our books."

A VOICE FROM MAPLE SHADE.

Mr. W. A. Dryden, son of the late Hon. John Dryden, writes: "I am of the opinion, however, that the time is almost here when our breeders of Shorthorns will actually take a greater interest in the milking qualities of the females in their herds. A most practical and efficient method to employ in that particular is the 'record of performance idea.'

"This is the only definite way in which any breeder may be able to obtain the information which will be of value in the long run. Every breeder owns a number of cows that are good milkers as evidenced by the fat plump calf running at her side but that is not definite and it appears to me that if ever the milking qualities of any breed of animals are to be improved, it must be through a definite system similar to that adopted by special dairy breeds. Even if such a course had a tendency to develop a special type in the breed, there is room in this big country for all and there is no doubt about an insistent demand for such a class of cattle from a certain class of our Canadian farmers."

HON. SPEAKER SPROULE LIKES THEM.

Hon. T. S. Sproule, Speaker of the House of Commons, says: "I cannot shut my eyes to the fact that dairying is one of the best lines the farmer can pursue so long as he can get help and therefore it is most desirable to breed and improve the milking strains. In connection with that it is most desirable to keep a record of the products for every cow so as to enable the good ones to be retained and improved and the unprofitable ones to be cut out from time to time and disposed of. From my limited experience they have given the best results with me,though I never adopted the test as it is usually carried out."

Of course there are breeders who would not mix up the dairy question with the beef question. Mr. John Campbell, of Woodville, in a rather long and vigorous letter, said, among many pertinent things, the following :—

"In my opinion no greater mistake can be made than an attempt to convert our Shorthorns into a dairy breed. The breed is far too useful as a dual-purpose, with beef the first consideration to attempt to make milking records for the breed . . . . . Shorthorn bulls all over the country are the lowest in standard seen for twenty years . . We can have beef producing Shorthorns capable of giving a fairly good account of themselves as milkers but failure will surely result if milking qualities are held of the first importance . . . . We should diligently study existing conditions ahd seek diligently how to restore beef-making propensities which are surely on the wane in sires and stockers."

A REFLECTION ON THE BEEF TYPE.

Now, we find in this letter of Mr. Campbell's the same thing that has startled men all over the country—a decay in the quality of the stockers. And when we consider the fact that for the "last twenty years" the Aberdeen ideals of Shorthorns have been leading at all our shows and have been heading all the various small herds of the country,

FARMERS WANT CHEAPER MONEY

A quarter of a century ago the United States was in the heyday of her development. Thousands of Canadian farmers sought her splendid opportunities and generally made good. Returning to their old homes, these men commented much of the ease with which United States money could be had for their ventures.

As everyone knows, the United States was assisted in her development greatly by her system of local and private banks. These advanced money in their local centres and so the local concerns were enabled to progress in harmony with national expansion. Of course this system was loose from a monetary standpoint, nevertheless it served a good purpose in their rapid development.

Contrasted with this, the Canadian system of branch banks stood out in poor comparison, except in certain cases where a local bank did business in the home town. The result is seen in the decay of rural progress in Canada and the concentration of wealth in large centres. Large firms are able to get financial backing for some big undertaking, much more readily than can small undertakers.

To-day we see the logical results. Banks are becoming larger. The tendendy is towards amalgamation. The little bank is being slowly but surely absorbed. The branch bank is becoming more and more a gathering agent for a big financial centre to the disregard of the local needs. In some towns which we could name, there are over a millian dollars on deposit, while the local loans are held down to less than fifty thousand dollars. And these are issued with reuctance only upon sure security and high rates of interest.

It is but natural that this pinch should be felt by the farmer. Agriculture is the greatest industry in Canada. It is not operated by a few magnates; it is carried on by a multitude of indedendent free men. Individually they are powerless to remedy or control such a grievance as they certainly have in their requirements for capital.

However, there are signs outcropping in many sections which it does not take a seer to understand. There is a change booked for, in the no very distant future. Instead of having to pay eight and ten per cent. for money for farm mortgages, for productive improvements, for stock investments, and for kindred farm operations, these men are going to finance their own way either by government guarantee or by agricultural loan association.

Speaking of this tendency to centralization the Toronto Daily Star recently said: "Undue centralization in banking lends toward undue centralization in commerce and industry, and toward the destruction of independence . . . Rivalry in banking is good for commerce and industry and good for the whole country. If the process of amalgamation is carried on until there are only two or three concerns, then there will undoubtedly be an enormous pressure of opinion for strict Government regulation and possibly for Government ownership and operation."

We claim that the farmers of Canada should receive more consideration in the matter of rates in their demands for funds to carry on their undertakings. There is no surer class of credit than the farmer's credit. If government regulation, and possibly for Governments can give bounties to the steel and iron industries and bonus railways handsomely, they can justifiably insist on some form of municipal guarantee whereby farmers can secure credit at reasonable rates for reasonable periods of time.

We are glad to note that the Governments of New Brunswick and Nova Scotia are planning to make arrangements whereby farmers may procure money on easier terms than have been customary in the past.

RURAL PROGRESS.

It is a matter for congratulation that steady progress being made in the development of sanitary conveniences in rural districts where gravitation water supplies are not available and the old- fashioned is rapidly being replaced by chemical closets and the septic tank system.

A noted physician recently said: "Show me a way of abolishing the cesspool in country districts and I will show you a way of avoiding ninety per cent. of the sickness and disease in those communities."

According to statistics complied by the health department of several countries, more than ninety-five per cent. of contagious diseases are contracted by means of outdoor pit closets. A pit closet, however well constructed, remains a cesspool. Gradually seeping through the ground, deleterious matter eventually finds its way to the well from which the family draws its water supply. Distance of the privy-pit from the well does not save the latter from contamination, and the inevitable result is that the average country family is drinking water as deadly to health as if specially prepared to spread the most dangerous diseases. This water may be consumed for sometime with apparent immunity, but let a member of the family be in a run-down condition and the bacteria with which the well simply teems, will find an easy victim.

Apart from the seepage of obnoxious matter into the water supply, it is well known that the exhalations from privy-pit closets are highly injurious, and many cases of infection occur through breathing contaminated air in the neighborhood of cesspools.

It is in summer, however, that the outdoor closet successfully operates in spreading broadcast the seeds of disease and death, and its greatest ally is—the common housefly. From the very nature of its contents, a cesspool must be constantly swarming with deadly organisms and the housefly's mission in life seems to be to convey these organisms to where they will best accomplish their fatal work, i. e., to human beings. A fly that has merely alighted for a moment in a cesspool will deposit wherever it walks, some thirty thousand bacteria at each step. The possibilities of a fly carrying such a freight, walking upon, say, a dining-room table, are ghastly to contemplate. When we consider that not one fly but hundreds of them, are constantly engaged in this awful carrying traffic in many homes, it is not difficult to imagine the result. "Swat the fly" is neither a craze nor a fad. It is the cry of those who are fully awake to the fatal agency of the house-fly as a propagator of disease. If the fly were a clean insect, there would be no need of its extermination, but deprive a fly of dirt and you deprive it of life.

TWO BAD EGGS IN EVERY DOZEN.

The Toronto Globe says: The sale of rotten eggs is one of the causes contributing to the high cost of living, and local produce merchants are hopeful that the deliberate marketing of bad eggs will be made a criminal offence. A communication received from Dr. J. G. Rutherford, Veterinary Director-General and Live Stock Commissioner, contains the rather startling statement that seventeen per cent. of the eggs marketed in the provinces of Ontario and Quebec, are not fit for human food. As the wholesale merchant must increase the selling price of the remaining 83 per cent, the consumer is really paying for eggs he does not even have the privilege of using.

In his campaign to stop the sale of bad eggs, Dr. Rutherford invites the co-operation of the trade, and it is not improbable that legislation will be enacted to prevent the marketing of diseased produce.

A petition recently forwarded to the Department of Agriculture the Toronto wholesale men cited as a good example for this country the successful operation of a pure-food law in several of the States across the border. In Iowa, Missouri, Kansas, Nebraska, Minnesota, Pennsylvania and other Eastern States it is made a criminal offense to place on the market impure food products, such as rotten eggs.

The Commissioner bases the following estimate of useless eggs recently marketed in the Province of Ontario and Quebec upon data which the department has been gathering during the past three months. Chick development, 5 per cent.; shrunken or held eggs, 5 per cent.; rotten eggs, 2 1-2 per cent.; dirty, 2per cent.; cracked or broken, 2 per cent.; bad flavored eggs, 1-2 per cent.

The experience of local egg merchants is that the Government's estimate is conservative, as deliveries here contain on an average of 7 to 9 per cent. of cracked or broken eggs at 5 per cent. of "dirties."

Economic Production.

The Farm Superintendent of the N. S. A. College Farm, Truro, gave a few figures relating to the production and profit of the College dairy herd for the past year, to a class on Live Stock, during the last Short Course. I thought that these figures were worthy of more thought than could be given them there and so I made a note of those figures relating to the cost of production and give them herewith. I think every dairyman will find it to his advantage to give these figures a little careful consideration.

In the College herd the cost of producing 100 pounds of milk was as follows: Holsteins ranged from 56 cents to 96 cents; Ayrshires from 44 cents to 95 cents and Jerseys from 57 cents to 72 cents.

The cost of producing a pound of butter was: Holsteins, 11 cents to 24 cents; Ayrshires, 10 cents to 20 cents and Jerseys, 9 cents to 12 cents.

Profit per pound of butter ranged as follows: Holsteins, 13 cents to 5 cents; Ayrshires, 15 cents to 4 cents and Jerseys, 15 cents to 12 cents.

These are just the round figures. It will be noticed that the Jerseys have a marked advantage in each particular, notwithstanding the fact that the milking herd of Jerseys comprised only four cows, the best cow being accidentally killed the previous summer. The other breeds were represented by much larger herds, therefore more likely to contain extra high-class individuals. And further, the Jerseys were, to say the least, in such condition as to make a Jersey breeder rather ashamed of them. Evidently they were putting their feed where the ordinary dairyman wishes to have it put. Under these circumstances, this little herd of Jerseys made a remarkable showing and has added another quota to the vast numbers of proofs, that, along the line of profitable production the Jersey cow stands without a peer.

Economic production in dairying is not given the attention it should be given. If a cow gives a large flow of milk, she is classed as an extra good cow, while at the same time her yearly net profit may not be as large as another cow giving less milk and only classed as an ordinary cow. A few cents difference in the cost of producing a hundred pounds of milk, may appear to be rather insignificant, but applied to a herd of cows during a period of years, it will make a difference in the bank account, that would enable the hard working dairyman to rest from his labors during the latter years of his life. The dairying industry while the most profitable branch of farming is not so firmly established in this country as it should be. Every year shows a variableness in the total production of the different provinces. Part of this can be accounted for by good and poor years, drought, etc., and part by the fact, that many dairymen go out of the business, or, at least, reduce their herds to a large extent. The reason for this lies in the fact that dairying entails more constant hard labor than any other branch of farming and sooner or later the man engaged in it goes out of business contenting himself with an easier method of farming although less profitable.

To put the dairy business on a firmer basis, we must increase the profits to recompense for the labor involved. The way to increase the profits of the dairy is to keep the breed of cows that have proven, beyond a doubt, that they can produce dairy products at the largest net profit possible.

It is a popular idea with nearly all farmers that if they intend to sell milk they must fight shy of the Jerseys; but why, in the name of the first principles of economics, should this be so? If the Jersey cow can produce a hundred pounds of milk at a lower cost than say the heavier milking Holsteins, what is to hinder the farmer, keeping a few more Jerseys, to make up the amount of milk? These extra cows would be paying him a handsome profit; he would need no more feed than if he kept a smaller herd of larger cows, and he would be putting his dairy business on a firm economic basis. At the same time it must not be considered that the Jersey is a shy milker. She is constantly demonstrating the fact that she can produce a large flow of milk. I have before me the report of the dairy show in England, which says: "It is generally supposed that the Jersey is a butter cow and of comparatively little use for the milk trade. But the breed's performance at the dairy show indicates this to be a mistake. The best nine cows in the Jersey class averaged 42 lbs. milk per day and this at an average period of lactation of over 140 days, or, nearly half way through. Considering the fact that they are small cows and consequently consume less than the larger breeds, it is not surprising that they are found profitable for milk-selling dairying."

Cows that yield 40 lbs. of milk daily cannot be considered shy milkers. The modern up-to-date manufacturer is constantly studying how he may reduce the cost of producing his manufactured goods by the use of improved machinery and more skilled labor; but at the same time he must be very careful not to lower the quality of his goods and thereby lose his market. In the dairy business, when we lower the cost of production by the buying of the most economic milk producing machines in existence in the shape of Jersey cows, we have the happy effect of not only reducing the cost of production, but at the same time increasing the quality of the product and widening the market for the same.

Great strides have been made of late years in increased yearly production of milk per cow; but in these efforts for large production it must be remembered that it is but labor in vain unless the yearly net profit is increased also.

These few facts, I think, will interest farmers who are thinking of starting in the dairy business and also those who are already engaged in this business but who find their profits are not large enough.—W. R. Clark, North Wiltshire, P. E. I.

Must the Sheep Industry go Unprotected.

Editor Maritime Farmer:—

Would you kindly change my adv. again? I do not know your rates for the space I have taken, either by the year or half yearly. I want to hold the space until I have disposed of as many turkeys and geese as I will be able to place through the medium of your paper. I would like to know your rates for advs. running some months.

Before closing I simply cannot refrain from saying something about the article by Matthew Lamont in your Spring Number. We do not keep sheep, and believe there is more money and less risk raising geese, all things being equal. But I do not know when I have read anything that stirred me so deeply as this article in question. It has the quality of simplicity and directness that has made the Scotch powerful as writers, that subtle something at once the admiration and despair of all who attempt to write.

Mr. Lamont has made a strong case for sheep. He has struck a note of tragedy too, that must have stirred intense indignation in all who read it, still he has written with remarkable dispassion. We are struck with wonder at the magnanimity of the man who has contended honestly and with more than average intelligence in the interests of a great and important industry and it all ends in what seems to me an infinitely pathetic wail, "I cannot get my flock to increase, the dogs are bound to keep the numbers down." Tnis following the bloody tragedy on the lake shore when his entire flock of Southdowns were destroyed. When I recall the flocks of these beautiful animals seen at some of the big fairs, my heart aches for the man. The sight must have been enough to crush him, and the simplicity with which he tells the story, makes it more effective than if he had tried to drive it home with stronger language. The most astonishing thing about the whole business is—this nuisance is old as our civilization and still exists. That a source of wealth and affluence is crippled and held in check by dogs, in nearly every case worthless curs, beside of which the "houn' dorg" of the South is a gentleman, is simply astounding.

A man driven from an industry for which he is filled by disposition and training into doing that he admits is to him a laborious and distasteful task, because the neighbourhood insists upon maintaining a pack of domesticated wolves called dogs by courtesy, by which the country is made poorer every year. The shame of it!

The wolves were driven from these Provinces years ago, pity up to the people to follow up the good work with a grand massacre and a burnt offering to the harmless creatures that have bled and died where the unmitigated nuisance has flourished. If any one has anything to say in favor of the sneaking sight provoking dog, let him come forward and speak up if he dares. That a source of wealth, meaning happy homes and a contented population is menaced and rendered risky and uncertain because of a nuisance absolutely within the will of the people is unbelievable.

If sheep were attacked by some strange and unheard of parasite, and died by hundreds every year, how long do you imagine our Experimental Farms and Agricultural Colleges would be providing the means by which its ravages might be checked? I'll warrant you thousands of dollars would be spent, if need be, and agents despatched to remote corners of the earth that a remedy might be found, because the people have abundantly endowed these institutions and authorized them to safe guard the agricultural interests of this country. The same authority could equip a man in every neighbourhood with a good Winchester repeator and a few rounds of ammunition, the cost of which would be practically nothing, and these Provinces would be thousands, yes, in years to come millions of dollars richer. Depend on it, it won't be long before the people will say, "The dog must go."

I some way cannot refrain from writing this, surely everybody who reads the article must feel like "speaking out in meeting."—Sarah E. Moses Smith.

Use of the Land Roller.

Rolling the land may be of great benefit to the crops, but it may also be of harm. We roll to pack the ground around the roots of young grass, to level the ground for mowing, to crush clods, warm the soil, make the ground moist. Rolling may do some or nearly all of these at one time.

It is a good practice to roll the young grass in the early spring. The action of the frost and animal life during the fall and winter has left the ground in an uneven state, and much of the grass may be heaved out so that its roots no longer have a close hold in the soil. Rolling will level the land and also press the ground firmly about the roots. The field must not, however, be rolled when wet, especially if the soil is heavy; for a crust may be formed on the surface that will prevent the entrance of air into the soil; and air is most necessary for the life processes of the nitrogen, fixing bacteria and also of all higher plants.

Oats are rolled primarily to level the field, but there are also other good results. In the first place the soil is made warmer. King, of the Wisconsin experiment station, has found as great a difference as 10 degrees at 1.5 inches below the surface in favor of rolled, in comparison with unrolled ground on similar and adjacent soil, and a difference of 6.5 degrees at a depth of 3 inches. This difference of temperature is due to the greater conductivity of the rolled soil on account of its finer texture, and the closer contact of the particles.

Rolling also makes the soil more moist. It does this through increased capillary attraction, due to the closer contact, the compacting of the soil

(Continued on page 562).

HORTICULTURE.

The Pruning of Trees and Shrubs.

The writer was recently presented with some beautifully colored Spy apples, grown in an orchard near Lake Ontario, which orchard has been pruned most scandalously.

Pruning is as necessary in the production of high-class apples as is spraying and it requires the exercise of even more judgment; but I would much prefer that my trees be never pruned to having them pruned in the thoughtless and destructive way these trees were treated. As a result of the very bad pruning these fine old trees had received, scarcely any fruit was borne less than fifteen feet and most of it from twenty to thirty from the ground. There were very long bare branches towering away up into the air offering splendid opportunity to the winds to knock the fruit off and necessitating great difficulty in the picking. If any of the readers have been unfortunate enough to have had their trees thus pruned by professional quack pruners, I would advise that they prune them back at the ends of the branches causing them to throw out water sprouts from the larger branches down near the trunks, and then each spring cut back these sprouts to four or five good buds of the previous year's growth and thus cause them to develop fruit-spurs and re-clothe the large branches with fruiting wood, that they that are strong and sturdy may bear the major part of the crop where they are less affected by the winds and where the fruit is more easily gathered. But in order to be able to develop these fruit-spurs in the centre of the tree it is necessary to keep the outer part open so as to admit the light and air freely all through the head, otherwise the absence of a reasonable amount of light in the centre of the tree causes all fruit-spurs to die off.

ANNUAL BEARING IS ENCOURAGED.

A properly pruned tree is one that has been continuously kept thinned towards the outer ends of the branches so that light and air has always been freely admitted all through the head so as to preserve in good health a goodly number of fruit spurs all along the large, strong branches, right down to the trunk, and to keep the fruiting wood near the ground. In the cases of trees that are inclined to overbear on alternate years it is a a good plan to thin the fruit spurs especially out towards the ends of the branches, that they will not set more apples than they have energy enough to bring to the highest state of perfection and this will often cause the trees to become more or less annual bearers.

Then if the tree has become improperly balanced it is well to cut back the branches on the heavy side to permit the growth on the light side to catch up and make a better proportioned tree.

In all cases the cutting should be done close to the main trunk or branch that there is no stubs left to prevent treating over of the wounds.

If large branches must be cut out it is advisable to paint the wounds a day or two after made, the delay of a day or two being necessary that the fresh wound get a chance to dry that the paint may adhere better than it will to a fresh and moist wound.

IMPROPER PLANTING CAUSES LOSS

There are more losses with newly set trees due to improper planting than to all other causes combined.

Many planters desire large trees, thinking that they may get a bearing tree quicker with such than with younger trees. This is a very great mistake. The fact is the older the tree is when planted the longer it will take to make a good orchard tree and the greater is the risk of loss. A two year old tree is, in the writer's opinion, a much more satisfactory tree to plant than an older one and will make a much better tree in three or four years than the same tree would make if not transplanted till three or four years of age. The longer the tree stands in the nursery the farther out the fibrous root growth will have gone and the less digging.
feeding roots will be taken up in the

It required all the roots the tree had before digging to maintain its trunk and branches and make a reasonable growth, so we cannot expect a tree with large top and trunk which has lost most of its roots, to live and thrive after transplanting. The trunk and branches are continually evaporating the moisture, its life blood, which standing in its new location for two or more weeks while the roots are getting hold of the soil to enable it to draw on the earth for new supplies and this means a severe weakening if not indeed killing of the tree before it starts at all. In order that the tree may not suffer this drain on its vitality while it is forming its new feeding cells on its roots it is necessary to cut back the top and it is not likely to be cut back too severely.

I would first trim the top to a desirable form, leaving from three to five strong branches to form the future head of the tree and then cut these branches back to three or four buds each, and even to one good bud if the tree has not good roots. I would prune off all broken and mangled roots and prune off the ends of all the large roots, leaving a smooth wound which readily callouses over and sends out a mass of fibrous roots while the torn or mangled ends left in the digging never heal over and are a detriment to the future health of the tree.

In planting care should be taken to see that nothing but fine, fertile soil is placed in the hole and that it is well packed in among the roots that capillary attraction may bring the moisture up rapidly among the roots from the earths reservoir below, and it is advisable to maintain a good earth mulch about the trees to preserve that moisture in the soil. I very much prefer the mulch of earth, frequently stirred during the early part of the growing season to a mulch of manure as used by many planters. But I would discontinue cultivation by about the first of July that the tree will stop growing and ripen up its wood before winter sets in.

I would never plant young trees in an old orchard or in grass land, as they have a very poor chance to succeed in such places, and usually prove but a disappointment. I would severely prune back any young deciduous tree or shrub before planting, except possibly such decorative trees as cutleaf birch, in whose case such pruning back may mar its future beauty. —W. J. Kerr, in Farmers' Magazine.

What a Spray Nozzle Should Do.

A great many men treat their nozzles something like this: A spray nozzle should give a fine spray with the same disk used all last season; it should never need new disks; never need new packing; it never needs cleaning, but should do perfect work, even though stopped up with leaves, twigs, straw and other things that got in because the top of the tank wasn't covered, or that would have been caught by the strainer, only the strainer had a hole punched in it last winter and wasn't mended yet.

Don't expect a neglected nozzle to do good work. It can't. It should be washed out with clean water every night. The best way to do this is to pull the suction hose out of the tank, stick it in clean water, and then run the pump until clean water comes through the nozzle.

A spray nozzle should have a disk with a small hole, if a fine spray at reasonable pressure is expected. Disks will wear out. Have plenty of extra ones and use them. Keep the tank clean and strain the solutions into it. It is easier to keep sediment and trash out of the tank than to pick it out of the nozzles.

The nozzle is the business end of the whole outfit. For it we have engine, pump, and hose. It determines the pressure to be carried and the pressure determines the size of the engine, the grade of the hose, the wear of the disks. High pressures are responsible for a good many of the troubles of the spray rig. Are nozzles now available giving good sprays at as low pressures as they should?

The whirling spray nozzle attains its results by using centrifugal force to send the liquid into the air in a thin, conical sheet, when the resistance of the air tears this thin sheet into a fine mist. This nozzle gives little or no spray in the center of the cone. Attempts are being made to put a center into the cone, the general plan adopted being to interfere with the smooth whirling liquid inside the nozzle, churn it into a froth, and blow it by main strength sputtering into the air.

The throat passage is put there to direct a jet into the eddy chamber. There is needless loss of pressure in getting the liquid into this passage if the edges of the opening are not rounded.

The jet should be smoothly turned so it will be directed into the eddy chamber in the direction in which the liquid must whirl. Pressure is lost in throat passages with sharp turns. The shape of the jet after leaving the throat passage must be rectangular, in order to fit into the spiral in which the liquid whirls.

Now suppose there are two throat openings into the eddy chamber, and that this chamber is a true circle inside. What becomes of the stream shot in from the throat? It follows the outside of the eddy chamber, of course, until it comes to the second throat opening, and there if the opening is not protected in some way it strik es squarely into the stream coming out at that point. Result? Eddy and froth, stoppage of the whirl and loss of more pressure. The same thing is going on at the other side of the nozzle.

To sum up the points I wish to emphasize as essential to the design of a successful low pressure nozzle are: 1, Easy entry into the throat passages: 2, gradual turning of the stream in these passages toward the eddy chamber; 3, a rectangular stream; 4, spiral sides to eddy chamber. Lastly, no nozzle will do good work unless treated right.—Prof. H. W. Riley, N. Y. Col of Agri.

Pollination of Orchard Fruits.

Prof. C. I. Lewis and C. C. Vincent of the horticultural department have done some excellent work in the line of cross-pollinating the orchard fruits. The pollen producing powers of the Oregon Experiment station af eighty-seven varieties of apples were worked out and of this number fifty-nine were found to be more or less self-fertile, and from these were selected pollinizers for twenty-nine varieties that are more or less infertile. It has been proved that the Yellow Newtown and Esopus Spitzenburg, which are two of the most important varieties for Oregon, both need outside pollen to cause proper development of their fruit. Fortunately, however some of the other most valuable commercia' varieties are good pollenizers for them, notably the Jonathan. Grimes, Ortley and Arkansas Black. The pollen of Spitzenburg is not very effective on the Newtown or that of the Newtown on the Spitzenburg; this latter is rather unfortunate, for it is sometimes desirable to plant these two varieties in the same orchard. It was also found that even the self-fertile varieties were materially benefited by the crossing of their flowers with the pollen of others. The apples were larger, better formed and contained more and plumper seeds, showing the invigorating effects of the foreign pollen.

Very careful experiments were made by the Oregon station in determining the effect of wind as an agent in distributing pollen. Glass plates were covered with vaseline and placed at different heights and distances from the trees when in bloom and afterward examined with the microscope for pollen grains. Very few were found outside the limits of the branches. One apple tree seven years old that bore 1,500 blooms had every petal and stamen removed before the pollen began to escape. Watch was kept during the whole time that the stigmas were in a receptive condition in daytime, which lasted about ten days and only eight bees visited the tree, because there were no petals to attract them. Only five apples were set, or one in three hundred. More than twice that number of honey bees visited a tree twenty feet distant in thirty minutes that had perfect flowers and bore abundantly.

The conclusions derived in the Oregon station from their work were as follows: Much of the unfruitfulness of orchards is directly chargeable to lack of proper cross-pollination.

Mixed planting of varieties will afford the greatest possible opportunities for fruitfulness. Even self-fertile kinds are benefited by it in increased size and color of fruit.

The pollen of almost any variety will be potent upon the pistils of any other variety, although not upon those of its own.

Winds cannot be depended upon to carry pollen from tree to tree.

The blooming period of orchard fruits for each species lasts from ten to fourteen days. No spraying should be done on any tree when in bloom, because of danger to bees and of injuring the reproductive organs.

The distance apart from trees for purposes of cross-pollination should not exceed that of blocks five or six rows in width. The benefits will be reciprocal between the varieties.

It is imperative that the varieties next each other bloom at the same time to effect cross-pollination.

Cross-pollination does not transmit the color or any other chacteristic of one variety to another.

In planting our orchard of 370 acres, mindful of our experience in Nebraska, we do not plant more than four rows of any one variety together and then alternate with another. Notice in the Oregon experiment work that Jonathan and Grimes Golden and Arkansas Black are good varieties with which to pollenize others. In our orchard we plant four rows of Jonathan, then Winesap, with an occasional row of Grimes Golden. We have also planted a small percentage of Delicious, King David and Winter Banana. Perhaps 10 per cent of the orchard in these minor varieties, the major portion of the orchard, were Jonathan, Winesap and Rome Beauty.

Why plant Rome Beauty ?

It is a later bloomer than some others, or perhaps we will say a continuous bloomer for quite a number of days. It sometimes yields a crop of fruit when other and earlier bloomers are injured. In planting Rome Beauty it may be alternated with Jonathan.—E. F. Stephens, in Twentieth Century Farmer.

A Range should be a permanent investment and guaranteed as such. The "Pandora" is fearlessly guaranteed by dealers as well as by the makers, simply because they know that it will give utter satisfaction. Can you wonder that so many people buy 112

McClary's Pandora Range

Thoroughness and Progressiveness are the ideas which have always dominated the management of this college; showiness and superficiality the rocks to be avoided.

Our reward has been ample and satisfying, our last year being by far the best in our history of 45 years.

There never was a time when people appreciated the real merits of Chamberlain's Cough Remedy more than now. This is shown by the increase in sales and voluntary testimonials from persons who have been cured by it. If you or your children are troubled with a cough or cold give it a trial and become acquainted with its good qualities. For sale by all Dealers.

Injury by Bud Moth—Its Control.

A demonstration of effective control of what is probably one of the worst pests to apple orchards in Maine has been given at Highmoor Farm the past season. Material from Highmoor Farm submitted to the entomologists of the Maine Agricultural Experiment Station, both the spring of 1910 and 1911, contained the larvae of the bud moth in sufficient numbers to indicate a serious infestation. At the close of the season (1911), however, the station horticulturist is able to say of the situation that what leaf and bud eating insects were present were brought under control.

Remedial measures: Arsenical sprays (either alone or in combination with bordeaux) should be applied as soon as the buds begin to swell in the spring. In cases of severe infestation, additional sprays at the middle and end of May are sometimes necessary. It is also very desirable to pull off and burn the withered clusters of leaves containing the caterpillars and chrysalids early in the spring.

The caterpillar of the bud moth works in the unfolding flower and leaf buds of orchard trees, often doing great damage to the crop, besides attacking nursery stock and young trees. It is an European insect but is now widely distributed in the northern United States and Canada. Besides the apple, it feeds upon the pear, plum, cherry, quince and peach trees, and in Maine has been bred from blackberry plants.

The half-grown, brown, hibernating caterpillars usually emerge from winter quarters about the time the buds begin to expand, their first appearance depending on the advance of the season, and ranging over two or three weeks. When they are out early, they gnaw into the buds. If the buds are open, they crawl inside. They attack both flower and leaf buds, fastening the parts together with silken threads, forming a nest, within which they feed upon the enclosed tender flower or leaf parts. They do not confine their depredations to a single leaf or flower in the bud, but increase the injury done by sampling nearly all. They sometimes bore down the stems a few inches, killing the terminal shoots. The bud attacked turns brown, making the nest conspicuous. The caterpillars feed mostly at night for six or seven weeks and moult several times. When full grown, the caterpillar forms a tube out of leaves which it lines with thin, closely-woven silk, and within it soon changes to the pupa. In about 10 days the pupa works its way nearly out of the tube by the hooks on its back. The skin splits open and the moth appears. The moths are on the wing during the latter part of June and the first of July. They fly mostly at night, resting on the trees during the day time, when they may be easily recognized by the white bands on the ash-colored wings. The moth has a wing expanse of 3-5 of an inch. They live two or three weeks, during which time they mate and the eggs are laid. Eggs, which resemble small fish scales in shape, are laid singly or in clusters, mostly at night, on the under side of the leaves. The eggs hatch in seven to 10 days. The young larva feed upon the epidermis of the leaf, forming a silken tube for protection. After the fourth moult, which occurs the last of August or the first of September, or before the leaves fall, they leave the silken tubes and form a silken winter home (hibernaculum) on the smaller twigs near the buds, in which they spend the winter. The appearance of the hibernating larva in the spring completes the cycle of life.—Chas. D. Woods, Director, Orono, Me., in Maine Farmer.

An IHC Manure Spreader Saves Valuable Fertilizer

THE farms of Europe have been worked for centuries, yet the average production of wheat from those farms is nearly 30 bushels per acre; more than double the average yield of American farms. What is the reason for this tremendous difference?

The reason is that European farmers know the value of stable manure as a fertilizer. The average European soil is not as fertile as the average American land, but the European grows heavier crops because the fertility of the soil is kept up constantly by the liberal use of stable manure.

While there is not so much stable manure in this country, what there is can be used to far greater advantage when an I H C manure spreader is used to distribute it.

I H C Manure Spreaders Corn King, Cloverleaf

make one ton of manure go as far as two tons spread by hand. By pulverizing the manure and spreading it in an even coat, light or heavy as may be needed, all over the land, they insure a perfect combination of the plant food elements with the soil. There is no over fertilizing in spots, to produce an uneven stand of grain. Each square foot of ground gets the same treatment.

The superior mechanical construction of I H C spreaders is the reason for their effectiveness. They solve every problem of correct spreading. Light draft is secured by the proper construction of wheels and correct principles of gearing. When I H C spreaders are thrown in and out of gear the beater drive chain is not shifted.

The advantages of this construction are: Positive traction—the chain engages nearly half the teeth on large sprockets instead of only a few; chain worn on one side only instead of on both sides as in other constructions; simple, effective chain tightener instead of a complicated, troublesome one. These all add to the durability of the spreader.

I H C spreaders have no reach. They do not need one. Because of this feature an I H C spreader can be turned in its own length, a great convenience at any time. I H C spreaders have many other advantages which the I H C local dealer will explain to you. See him and get catalogues and full information, or if you prefer, write

RU-BER-OID Roofing

TRADE MARK REGISTERED.

Lasts, Lasts, Lasts, Lasts

We do not guarantee RU-BER-OID Roofing for any definite number of years, because we do not know yet how long it will last.

The first RU-BER-OID Roofs, laid 21 years ago, are still water-tight, weather-proof, and giving perfect service—and they look good for many years more. This remarkable durability is due to the RU-BER-OID gum with which the fabric is saturated and coated. It is a compound of our own, tasteless, odorless, not affected by extreme heat or cold, by fumes, gases, or any other of the enemies which destroy roofing.

In years of tests, on all sorts of buildings, in all sorts of climates, RU-BER-OID has proved conclusively that it gives longer and more complete protection per dollar of cost than does any other roofing. Write for samples and Booklets.

DAIRYING.

Soilage vs. Silage for Dairy Cows.

During the past two summers the Animal Husbandry Department has compared the value of soiling crops and corn silage as a means of supplying summer feed to the dairy herd. Soiling crops sown from April to June furnished a continuous supply of green forage during the dry season from July to September. In 1910, green clover, a mixture of peas and oats, sweet corn, sorghum, and field corn were used, but in 1911 green clover and sorghum were discontinued.

Half of the dairy were fed corn silage, and half, soiling crops, each lot being kept on scant pasture and receiving equal amounts of concentrates. Silage was greatly preferred to the early soiling crops, such as green clover, sorghum, and peas and oats, and the silage fed animals produced a greater amount of milk. Larger yields of corn than of soiling crops were secured. Another important factor is that the soilage system required much more time daily, that too, during the busiest season of the year.

A consideration of all the factors involved indicates that the farmer can well afford to have corn silage available for summer feed up to the time the corn crop reaches the milk stage, when he can perhaps better afford to feed green corn than to continue feeding silage.—Wisconsin Bull. 218.

"Old Spot" in Court.

Imagine the following case being placed on trial in the Circuit Court and possibly you might learn a lesson from it:

John Jones swore out a warrant against his cow, Old Spot, charging her with consuming more food than she produced in milk, or than her milk could be sold for. This being a capital offense by statute law, the poor cow was in desperate straits, for a conviction meant the loss of her life. She consulted a good lawyer, and after an interview he advised her that John Jones had no case against her at all, but she told her lawyer confidentially that the charge was true and she had no way of getting out of it. He informed his client that he would attend to that part of it and that she would not even be called upon to testify.

The case being called for trial, Old Spot through her attorney entered a plea of "not guilty"; the jury was selected and sworn. Old Spot was very nervous and restless and wondered that her attorney should be so cool under the circumstances.

John Jones, being complaining witness, was called to the witness stand and duly sworn. He testified on direct examination that he fed Old Spot good feed and plenty of it, but that she did not produce enough milk to pay for her feed and therefore, according to the statute law governing such cases, should be condemned and sold to the butcher for immediate slaughter.

When the witness was turned over to Old Spot's attorney the poor old cow had completely lost her nerve, but she gradually recovered her composure as the cross-examination progressed, as follows:

"You say, Mr. Jones, that this old cow has not been giving enough milk to pay for her keep?"

"Yes, sir."

"You have been feeding her well?"

"Yes, sir, her condition shows that."

"What have you been feeding her, Mr. Jones?"

"Good timothy hay and corn."

"How much?"

"All the hay she would eat and about twenty ears of corn a hay."

"You milked her regularly every night and morning?"

"Yes, sir."

"Did you ever weigh her milk or plenty of water?"

"Yes, sir, she had a pond in summer and I watered her in the horse trough in winter."

"What did you do with this cow's milk, Mr. Jones?"

"Made butter from it."

"How much butter did you make a week from this cow's milk?"

"I don't know; never weighed it separate."

"How much milk did she give in a year?"

"I don't know."

"How much did she give in one day?"

"I don't know exactly."

"Did you eper weigh her milk or try to find out how much butter she made?"

"No, sir."

"Then, how do you know she did not pay for the cost of her feed?"

"I never thought she did."

The last we heard of Old Spot she was still eating her timothy hay and corn, glad she was living, and Mr. Jones hadn't yet gone to the trouble to prove her character and condemn her.—Kimball's Dairy Farmer.

Standard

The Makers Build This Machine To Give Lasting Service

There is no cream separator in the world made from finer materials than the **STANDARD**. For instance, the gear spindles are made from a special grade of tool steel, ground and polished—a steel so hard and wear-resistent that tools are made from it for drilling through ordinary steel. This special tool steel costs five times as much as steel in ordinary separators, but ten ordinary spindles wear out before one **STANDARD** spindle.

The **STANDARD'S** Discs are made of steel, heavily and smoothly tinned. Stand on one and test its strength in comparison with aluminum or tinned iron discs. The Bowl Bottom is made from special steel forging. If the **STANDARD'S** bowl falls on the floor it won't bend or break.

But why go further. You've already learned enough to know that the **STANDARD** is built to last long. And it has been given a test equal to skimming 100 pounds of milk every day for six years. At the finish there was no wear visible on the working parts. It was easily good for 20 years more. The test is fully described in our booklet. Write for a copy today.

The Renfrew Machinery Co., Limited

Head Office and Factory: Renfrew, Ontario. Sales Branches: Winnipeg, Man., and Sussex, N. B.

Abnormal Milk.

Milk abnormalities are important owing to their secondary action in producing disease in man.

Watery Milk—This is distinguished by an absence of fat and caseine, and an excess of water. It is bluer in color and of a relatively higher specific gravity. It is caused by poor, watery food, by disorders of the stomach or bowels.

Curdling Milk.—Premature coagulation of milk is of common occurrence in cows' milk. It may be caused by any of the following conditions:

Digestive disorders, sour foodstuffs; from diseases of the udder, especially inflammation and swelling in advanced pregnancy.

Nympomanical Conditions.—Overheating of the body from movement or exercise.

Non-buttering, Fermenting, Frothy Milk.—This is to be found in digestive disorders, also in udder diseases and in the presence of micro-organisms. Always presupposing, of course, that the fault does not lie in the method of making the butter.

Slimy and Stringy Milk.—In this condition the milk can be drawn out in long, tough threads. It is the result of bacterial infection. The casual organism seems to be bacillus lactis viscosus, a form first found by Ademetz in surface waters. Ward has found this germ repeatedly in water tanks, where milk cans are cooled, and under these conditions it is easy to see how infection of the milk might occur.

Soapy Milk.—A soapy flavor in milk was traced by Weigmann and Zurn color-producing bacteria that are able to grow in milk, but their action is presence of blood, which is most frequently caused by some disease of the udder.

Blue Milk.—Blue milk has been known for many years; it appears on the surface of milk, first as isolated particles of bluish or grey color, which later become confluent. It is from bacterial origin.

Foreign Matter in Milk.—Of foreign substances in milk, the most important are: Dirt, abnormal flavoring matter, scents, pigments, drugs and poisons, also morbid substances such as blood, pus and various bacteria already named.

Dirt.—This comes from the cow's udder, which is often smeared with manure and urine, and consists therefore almost entirely of this filth. If the cow be diseased (diarrhoea, entitis, tuberculosis) infection may be conveyed to those drinking the milk. —Dr. E. F. Jarrel, Forth Worth, Tex.

Ropiness in Milk.

The appearance of ropiness in the mixed milk of a herd several hours after milking is due to the growth of bacteria, which, as a general rule, gain access to the milk after it has left the udder of the cow, though in a few instances they may exist in the udder before milking. It is not to be confounded with what is known as "garget" milk, which is probably due to the presence of fibrin and white carpuscles from the blood forming masses of slimy material in the milk, and is it not propagated by transference into another sample of fresh milk. The various organisms which cause ropiness in milk are very numerous, and more or less acid-producing. The ropiness is due to the production by these organisms of a slimy protein substance which is harmless from a dietic point of view. Moreover, the acid they produce precipitates the casein, which in that state helps to thicken the slimy substance produced and is not afterwards dissolved. With one exception these organisms are harmless, the exception being the bacillus Guillebeau, which comes from diseased udders. Some, in fact, are prized as "starters" in the making of certain kinds of cheese.

PREVENTION OF ROPY MILK.

(1) As water is a frequent source of the trouble, special care should be taken in washing the milking pails, strainer cloth, etc., after each milking. When thoroughly clean these should be well scalded, and should not again be rinsed with cold water. It is well to scald the pails, etc., shortly before milking. (2) Great care should be taken to see that no water is splashed into the milk after the process of cooling, etc. (3) As dust is sometimes a carrier of these germs, the pails, etc., after washing should be kept upside down, and the milk wnen in the pails should be kept covered as much as possible. (4) The rooms where the milk is kept should be well cleaned. Wooden, cement, or stone floors may be cleaned with a mixture five parts sulphuric acid to ninty-five parts of water, but care should be taken that this does not get on the clothes of the person using it. (5) Wooden vessels should not be used, as they may persistently retain the ropy milk organisms. It is not well even to use wooden troughs for washing milking vessels, but when they are used special care should be taken to clean them on all such occasions. (6) Dilute solutions of washing soda favour the growth of the organisms, and it would be better to use sodium hypochloride or some other cleanser or disinfectant in cases of an outbreak of ropy milk. (7) Straw has been shown to hold ropy milk organisms, and the custom of wiping the udders of the cows before milking is very bad. After washing their hands for milking, milkers should not handle straw or fodder, nor should any such material be brought into the cow-byre just before or during milking. (8) The cow should be kept clean, and the udders should be washed and disinfected with a very dilute solution of formalin, especially if the cows have been standing in dirty water or wading through mud. (9) Ponds and streams should be fenced off, so that the cows cannot wade in them. (10) On the first indication of an outbreak of ropy milk the cows should, if possible, at once be turned into another pasture.—John Golding Esq.

Cause of Spongy Butter.

Spongy butter is due chiefly to storing the cream in too warm a place during the ripening period, which renders it practically impossible to make butter having a nice granular texture. It is sometimes quite impossible to churn it into grains at all, and when removed from the churn the butter is in a soft spongy condition, and very wet indeed. In such cases it is impossible to remove the superfluous water from the butter by working it, or any other means.

Make Better Cheese By Using Better Salt

The secret of good cheese-making is—the salt you use.

The smoothness, richness, color and keeping quality—all depend on the salt you use to salt the curd.

WINDSOR CHEESE SALT

Makes Smooth, Rich Cheese

For years, the prize winners at all the big fairs, have used Windsor Cheese Salt.

It dissolves slowly, salts the curd evenly, and makes a deliciously flavored cheese that "keeps." 74C

Care of the Freshening Cow.

Many a good cow has been lost by ignorance or lack of care at freshening time. Having had a sad and costly experience of this kind when I first began dairying, I now watch my cows closely for signs of trouble and take prompt measures to check any tendency to fever. There is seldom any trouble with cows at pasture. The green feed keeps the bowels free and conditions are natural and right. But with highly fed cows in winter there is a liability to milk fever. The scrub cow poorly fed never has this disease. It is the cow that yields a good flow of rich milk that is most liable to it.

The symptoms are not very noticeable at first. The first thing noticed is that the cow is not eating her feed. She picks at her hay, tosses it about, making a little lowing sound, often mistaken for her call for her calf. This occurs within the first twenty-four hours after calving, usually within twelve hours. Upon examination her horns are found to be cold, her nose hot and dry, she does not eat or chew her cud. The uneasiness increases and in a few hours, eight or ten at the most, often less, she goes down in a kind of stupor. Death ensues in about twelve hours after this.

Prevention is much better than cure and to this end I feed no heavy grain for the last month before freshening. Shorts are laxative and vegetables are cooling. These are good feeds. I do not wish my cows to be fat at this time. After calving, if they do not take hold of their hay briskly, I give a tablespoonful of cayenne and soda in warm milk or water. If this does not start the appetite I call a veterinarian at once. It will do no good in a day. I waited once to see if she would not get any better, and lost my cow. The oxygen treatment of milk fever has been very successful, and is used by nearly all veterinarians, but some rely on a cure by giving medicine to reduce the fever through the stomach. One of the principal points in the prevention of this disease is to see that the bowels and kidneys are freely active previous to coming in, and to guard against taking cold afterward.

Many dairymen feed oats both before and after freshening. These are good, but the main point is not to feed either before or soon after freshening, any heavy, indigestible feed like cornmeal or cottonseed. My cows relish a warm drink soon after freshening, and I give them a good supply of this. Milk fever is always fatal when allowed to run its course unchecked and one should be on the lookout for it at all times.—A. E. Vandervort in Hoard's Dairyman.

A New Dairy Cow.

The managers of the farm at the college of Hawkesbury, in Australia, are making an attempt to produce a new variety of dairy cow. The Jersey has been crossed with the Dexter Kerry with success, and in consequence the small herd which has been formed of the cross-bred stock is to be used in the experiment in the hope of fixing the type, which has given so much satisfaction. One of these cows was exhibited at the Sydney Cattle Show, her butter record for the year reaching 433 lb., while her milk was varied from 4 to 5.2 per cent. of fat. She is regarded as representing the actual milk and butter-making value of the herd, each member of which gives a similar average result. These cows retain the chief character of the Dexter, their colour being almost black, while the skin within the ears, on the escutcheon, and beneath the thighs is rich yellow, similar to the Jersey. The udders are of excellent form, and the general type is that of a first-class dairy cow ,without the slightest approach to the form of the recognized beef-producing breeds. They are said to be hardy and thrifty.

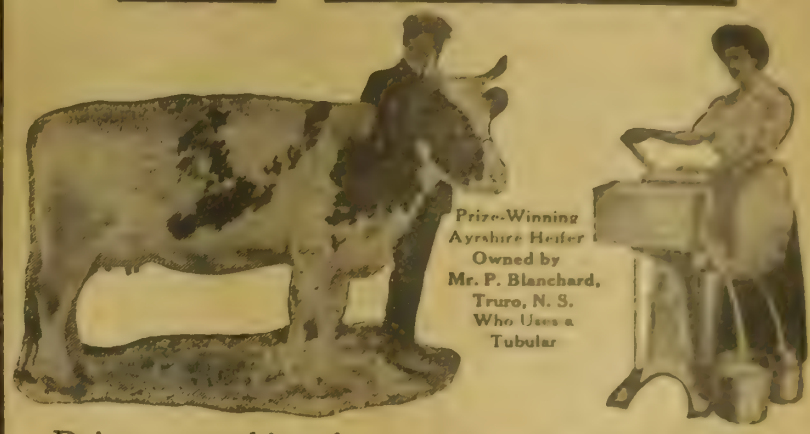
Notes.

Stand your cows around gently. Most always they will obey if you just press carefully on the right hip. Begin to push and crowd and holler and you have trouble on hand. Cows are quite like you and me; we don't like to be compelled to do things. We can be coaxed, but try to drive us—well, the fur will fly, that's all.

There may be certain lines of farming in which it is difficult to keep a definite account of the cost and profit but dairying is not one of these. There is no excuse for ignorance on the part of the dairy farmer.

Some people have an idea that dairying is an easy job and can be done without much effort. Dairy work is just like any kind of work. If it is going to be done profitably, it requires thought and care.

THE WINNERS



Prize-Winning Ayrshire Heifer Owned by Mr. P. Blanchard, Truro, N. S. Who Uses a Tubular

Dairymen making the most money realize that it pays them well to use only high producing cows and the highest producing cream separator. That is why Mr. P. Blanchard, successful dairyman and popular agricultural speaker of Truro, N. S., who owns the prize-winning Ayrshire heifer shown above, uses and recommends the

SHARPLES

Tubular Cream Separator

Mr. Blanchard is but one of many who are equally businesslike and use Tubulars exclusively. Tubulars are prize-winners. Have twice the skimming force of other separators. Skim faster and twice as clean. Dairy Tubulars contain no disks to chop or "taint" the cream or give it a metallic flavor.

By producing the best cream and the most cream, Tubulars make a profit no other separator gets. This extra profit is simply Tubular "velvet" which Tubulars make for other kinds, but which farmers and will make for you.

LIVE STOCK.

The Hill Grove Farm Dispersion Sale.

The Hill Grove Farm dispersion sale of pure-bred Ayrshire Cattle, advertised in recent issues of the Maritime Farmer, took place at East St. John on May 1st. The stock was brought out in excellent condition and reflected a great deal of credit on their owners, Messrs. James Barrett & Sons, who have been so successful in their breeding operations during the few years they have been engaged in the business.

J. A. Telfer, Markhamville, N. B., acted as auctioneer and in his initial attempt at this work in the Maritime Provinces,was highly successful.

The proceeds of the sale totalled $3275.00, an average for 28 head of $116.96. The highest price paid for a bull was $180 while the lowest price was $70. The highest price paid for a female was $300 and the lowest $30. The five bulls averaged $104.00 and the 23 females averaged $119.78.

"Hill Grove" tops the list of Maritime Province Sales; its nearest competitor being 41 Ayrshires sold in 1906 for $3305.50, when 8 males averaged $91.43 and 33 females averaged $78.00. The highest priced male sold for $300.00 and the highest priced female sold for $175.00. The lowest priced male sold for $23.00 and the lowest priced female sold for $20.00.

Following is a record of the Hill Grove Sale giving names and breeding of the respective animals, prices and parties to whom they were sold.

FEMALES.

Maggie of Silver Falls—25550—calved 24th August, 1906; bred by S. Creighton, Silver Falls, N. B.

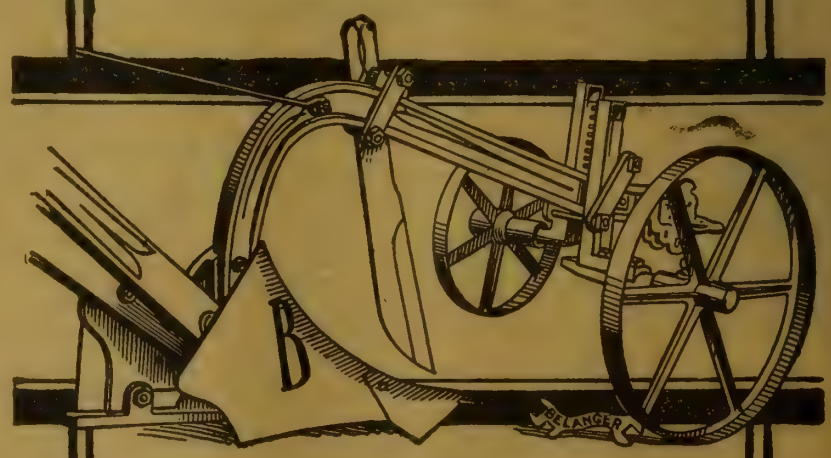
586 Henri Julien Ave. MONTREAL.

YOU DON'T NEED A SULKY PLOW—GET THIS TRUCK.



THIS truck under the beam makes an ordinary plow as solid as a sulky—takes the strain off the plowman's arms—makes it almost unnecessary to hold the handles—keeps the plow working at an even depth—makes the draught easier and more regular on the horses—makes it possible for a boy to plow as well as a man could. Anyone can put this truck on ANY plow in 5 minutes—you don't need to have one of our celebrated "B" plows to work it. The large 18-inch wheel runs in the furrow, regulating the furrow thickness and width; the small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow.

Remember, $5.00 will put this truck on YOUR plow—isn't that cheaper than a sulky? What's more, that price includes free delivery anywhere in Ontario, Quebec or the Maritime Provinces. Write to us for Catalogue No. 100 5

SEVERE COLD

DEVELOPED INTO

PNEUMONIA

DOCTOR SAID HE WOULD NOT LIVE.

Next to consumption there are more deaths from pneumonia than from any other lung trouble.

There is only one way to prevent pneumonia, and that is to cure the cold just as soon as it appears. Dr. Wood's Norway Pine Syrup will do this quickly and effectively.

Mr. Hugh McLeod, Esterhazy, Sask., writes:—"My little boy took a very severe cold, and it developed into pneumonia. The doctor said he would not live. I got some of your Dr. Wood's Norway Pine Syrup and he began to improve right away. He is now a strong, healthy child, and shows no signs of it coming back."

Do not be talked into buying any oth Norway Pine Syrup, but insist on getting the original "Dr. Wood's." It is put up in a yellow wrapper; three pine trees the trade mark; price, 25 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Gates' Life of Man BITTERS

Exercise and Sunlight for Pigs.

What little pigs need almost as much as they need their feed is sunshine and exercise. Even if they have to be driven out they should be gotten out for a nice sun bath and for a run in the yard every day. If a sow is a good mother she is a heavy milker and the pigs get lots to eat. If they just lie around in the pen and eat their fill they soon become overburdened with fat on the inside, and do not expand on the surface as they should. A pig's business in its early days is to develop and make surface for future use, rather than to lay on fat either externally or internally, and the condition is to be deplored when instead of doing this it fills up with fat. This it will not do if it uses up some of its energy every day in exercise. Its digestion and its bodily tone in general will also be much better if it uses its muscles in walking and running about.

A WALLOW FOR HOGS.

The modern farm ought to be equipped with a wallowing tank for the hogs. Nature prompts them on a hot day to seek comfort and relief in a mud hole of some sort—no matter how dirty. This mud sticks to their body and bakes it onto it, causing a big, thick crust to form, and it not unfrequently is the carrier of all sorts of foul skin and other germ diseases. Is it not far better to have a nice clean wallowing tank filled with a strong dip solution instead of foul mud, where they can fulfill the call of nature, and at the same time be relieved of scab and lice and similar diseases and pests instead of acquiring them?

Some Pointers in Sheep.

Mr. W. J. Malden contributes to the "Journal of the Bath and West Society" a discursive article on sheep breeding, which contains several useful points. His first is that too little attention is paid in the showyard to the teeth of the sheep. The length of the ewe's period of usefulness is determined by the condition of her teeth. If these keep sound and she be a good breeding ewe, the matron of the flock may live to a green old age, but no matter what her other merits may be, if her teeth indicate that "she cannot go round again," she must perforce join the ranks of the "culls" or the cast ewes. Now, bad teeth are preventible. They are the result of careless breeding. The proof of this is the fact that there is no uniformity in the ages of the broken-mouthed contingent, and when they are "cast" no pains are taken to ensure that those which take their place will be any better. Mr. Malden's point is that the character of the teeth in sheep should be made a point in judging them in the showyard.

Every flockmaster knows the value of twins. A ewe which brings twins with regularity is a great addition to the revenues of the farm. But current theories regarding the multiplication of twins, in Mr. Malden's opinion, stand much in need of revision. The theory seems to be that the results are determined by the weather during winter. The matter, however, is determined at tupping time. The question is settled when the ewe goes to the ram, and everything depends on the condition of the ewe at that juncture. There is, of course, a something in Nature's secrets regarding the fecundity of the ewe, but her condition is an element not to be overlooked. The "flushing" of the ewes on the eve of turning out the rams indicates the opinion among the better-informed flockmasters. The breeds which lamb comparatively early in the year generally are the more prolific. They get the best food in the late autumn, and come to the mating season in the best heart. Care should be taken that ewes do not get too fat in the late summer or early autumn, because such ewes are falling back by the time the rams and they are together, and are in a condition the very opposite of being "flushed." The same thing is proved by the well-known fact that a smaller flock of ewes has usually a higher percentage of lambs than a larger flock. The smaller flock gets the better treatment and a wider range of fresh pastures.

Mr. Malden has quite a number of good hints on the feeding of ewes. Turnips are good food for ewes in lamb, provided sufficient flesh-forming food is added. Such food may take the form of good clover hay, or any of the nitrogenous cakes, corn, &c. Starchy foods with little nitrogen are of little use in motherhood. They may fatten the ewe, but they do not help to replace the drain upon her involved in the carrying of her lamb or lambs. But nitrogenous foods should be judiciously used, especially in the form of linseed cake and cotton cake. The natural food of the ewe is grass, and a combination of foods which best stimulates the composition of grass will bring her to the lambing in best condition and ensure the production of lambs that will thrive and be profitable.—Scottish Farmer.

Prolific stock for breeding should be chosen wherever possible. A mare or cow that has reproduced annually for fifteen years or more is sure to leave this valuable quality with some of her offspring. The same is true of a stallion, a bull, a boar or a ram. If they are sure breeders they are of considerable value even if they do not possess all the fine points looked for in show ring animals. The first function of an animal is reproduction. After that it is up to the breeder to mate so as to bring this to the end desired.

SAVE YOUR HORSES

WHEN a wagon is designed for light draft, and the workmanship carries out that design, you have a wagon that is easy on horses. You need not be afraid to make your I H C wagon work. That's what it's built for. Loads and roads that make hard hauling are expected conditions for I H C wagons. I H C wagons have every advantage that first grade material and skilled labor can give them. They back up with actual results every claim we make for them. They haul heavy loads, with least strain on horses. Ask any farmer who has driven one of them. I H C wagons:

Petrolia
Chatham

will do all the work you would ask of any wagon.

I H C wagon wheels—the foundation of wagon service—are built from selected, air-dried wood. Hubs, spokes, felloes and rims are designed for strength and service, and the workmanship on them carries out the plans of the designer. Hubs are accurately bored and mortised. Boxes are forced to position in the hubs by hydraulic pressure. Therefore, they fit accurately, and, the skeins and skein boxes being paired, easy running is assured. The wheel has the proper amount of dish to make it as strong as a wheel can possibly be made.

The care and thought given to wheel construction and tire setting is evidence of equal thoroughness in the building of all parts of I H C wagons. Let the I H C local agent show you the extra value of other strong I H C points of construction. You can get literature and full information from him, or by writing the nearest branch house.

THE HORSE.

Handling the Stallion.

Many men are buying stallions this spring who have had no experience in handling them. Unless they make a careful study of their new business they are likely to feel the force of the old adage: "Experience is an expensive teacher." A short time ago I met a newly-purchased Percheron stallion in the public highway. The manager of a stock farm had bought the horse and placed him in the hands of one of his most trusted men. The man may have been trustworthy enough for ordinary farm work, but he certainly did not know the first essential in handling stallions. During the few minutes that we were stopped in the road the stallion made no less than half a dozen circles around his groom. During the same time he announced his masculinity by fully a dozen loud squeals.

All of that is unnecessary, and it is extremely annoying and a positive nuisance. The case mentioned is not an isolated one but what is very common. How is the trouble to be remedied? Simply by putting a "man" in charge of the horse. Man was created ruler over the lower animals. He must show and exert that power or else the stallion, most mighty of domestic animals, will assume the role of ruler. In most cases the man in charge is capable enough but does not know how or what to do. In the case already mentioned, when the horse was stopped the leader should have selected a favorable location. Then he should have turned to face the horse holding the lead rein in his left hand instead of the right. After squaring the horse up properly he should have held him with his head erect and his carriage at attention in every respect. Any force necessary to keep the horse from squealing might well have been exerted on the jaw chain without attracting any great amount of attention. The old custom of leading the horse on a long rein and allowing him to be continually cutting circles should be avoided. When I was working in an importing barn American-bred horses or imported ones that had been out for a few years were often taken on trade. It was seldom, if ever, that one of them could be handled or led or exhibited. Every boy in the barn tried to be absent when a horse of that kind was to be shown. Every man who handles a stallion should be a genuine horseman. He must be such if he is to succeed.

At the time of service is another time where real horsemanship is necessary. Naturally the horse is very excited. It requires a clear head, cool judgment, a steady and a strong hand to control him. There is no reason why a stallion should go about the lot rearing and charging and squealing. It is unnecessary and a positive discredit to the man in charge. While not advising brutal whipping or punishment in any way, I am frank to admit that the use of the free end of the lead rein, if done judiciously and with some force, will have a soothing effect upon an otherwise too amorous stallion. He should be required to approach the place arranged for trying steadily and quietly. His work there should be done without undue display of activity or masculine powers. If it is decided that the mare is not in heat, he should be quieted and led away at once. On the other hand if the mare is to be bred the most perfect control should be exercised over him. A strong vigorous masculine stallion is certain to be amorous, yet there is not one stallion in a hundred that cannot be perfectly controlled. Many stallions are practically ruined for satisfactory service by careless handling. Often one season with an incompetent or inexperienced man will practically spoil the horse for the rest of his days. Owners who find it necessary to hire a groom cannot place too much emphasis upon this point. It will pay them to invest a few dollars more in monthly wages and secure a competent and dependable man.

The matter of exercising a stallion seems to be a threadbare subject, yet it cannot be agitated too much. It never will be out of place to advise it until every stallion is worked regularly in harness in a rational and sensible manner. We have men in this locality who have some of the best mares in the country and who are good feeders and all-around horsemen, who refuse to breed to local stallion because through lack of exercise is necessary to keep up the ercise is becessary to keep up the health, tone and potency of the horse. Stallions deprived of it usually become practically impotent after a very few years.

Another way by which a groom may raise the real efficiency of his horse is in the wise selection of mares. Breeding a diseased mare endangers the usefulness of the stallion for the season, or possibly his lifetime. It is a serious menace to other mares that may be bred later. An authentic report was made a short time ago of a stallion becoming infected from one mare and he in turn infected more than fifty others. The loss incurred from the damage thus done is incalculable. The groom needs to know a diseased condition when he sees it. He needs to have enough sense and resolution to refuse to allow his horse to serve diseased or doubtful mares.

The use of the impregnator or the capsule is now an important factor in efficient stallion management. Artificial breeding is no longer an experiment; it is an assured success. By it the energies of the horse may be saved and at the same time the number of mares bred increased. Several mares may successfully be bred from one service. By this method it is also more certain that conception will take place than when no assistance is given from man's intelligence.

Improper feeding is another old and much threshed subject. Yet it is a partner with insufficient exercise in ruining and killing hundreds of good stallions every year. The most common mistake is in feeding too heavily. The next most common is the use of too rich feeds. A few years ago I was working as second man in a barn where four stallions were kept. There I won unpopularity by stating that the method of feeding was certain to kill the stallions. The head groom was accustomed to feed very heavily, keeping the feed boxes well filled from one week end to the other. Not more than one of the horses proved a sure breeder that year. One was almost totally impotent. Within a year the highest-priced of all died

Horsemen Attention!

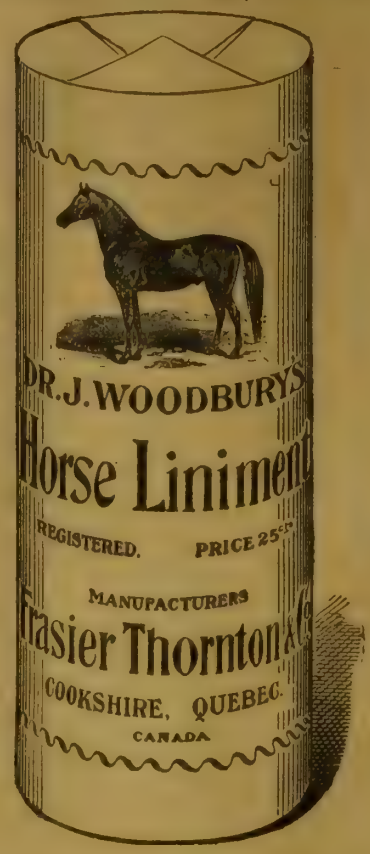
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

The Currie Horse Collar

Quality remains long after price is forgotten. This is a true saying regarding all lines of goods, but doubly true regarding horse collars. What matters a trifle, in price, when you are buying a satisfactory article. The Currie Collar can be obtained at very little more cost than the machine made collar and when you purchase one of these, you buy a collar, that will give perfect satisfaction. It is the great long straw, hair faced collar, of Eastern Canada. Second to none and no other its equal.

Minard's Liniment Co., Limited

at a comparatively early age. Post-mortem examination showed that fatty degeneration of the internal organs was the cause. Overfeeding had brought it on. The plain simple feeds in rather limited amounts, coupled with work or liberal exercise, will prolong the life and increase the health and usefulness of the stallion. —H. E. McCartney, in Breeders' Gazette.

The Horse and His Sensitive Foot.

"No foot, no horse," is as true to-day as it was when this aphorism first passed the lips of a wise horseman. Domestication of the horse, known in ancient days as "companion of the wind," has caused him to be subjected to many uses, and thus the constant reproduction of hereditary defects has changed him into a very short-lived, finely-strung piece of machinery, easily and constantly put out of repair, especially in his limbs and feet.

Susceptibility to ills is one of the penalties our live stock has to pay to domestication; none more than the horse, and with man he is of all the animals the greatest sharer in the accidents and dangers incident to a civilized life. Whilst travelling he may pick up a nail or slip on an icy road, and there is no hour in which he is not constantly incurring danger. It is because the foot is the seat of very sensitive parts and because the horse owes his great usefulness to the strength and soundness and durability of these members, that if the feet are bad, the whole beautiful body above is practically useless except for breeding purposes, and even then hereditary may play a very prominent part and the offspring may be useless on account of poor extremities.

The hoof is a box of horn consisting of a wall frog and sole, and contains a very sensitive layer of cartilage, called the laminoe, and a cushion to take the concussion of the roads, etc. The sole of the foot incloses the box on the ground surface and is shaped like the foot, except that a V-shaped opening is left for the frog. The frog is that triangular-shaped body divided into two equal parts by a deep fissure extending from the point in front to the spread behind. This is made of horn of a soft character and moist and elastic to a remarkable degree.

You will understand that such a complex organ as the foot must be susceptible to a great number of ills and accidents. Thus the horse's feet are his value, and he should receive every attention in order that he may be worthy of his food. A good horse is generally known by the feet he carries. A good set of hoofs generally carries a good body above. Strict attention should be paid to the feet night and day and an examination for sores, nails, etc., should be given the animal before and after driving.—W. M. Phillips.

Percheron Brands.

Percheron horses imported from France bear several brands, the meaning of which is not altogether clear to many. A monogram of the letters "P" and "S," the "S" placed over the "P" so as to resemble the dollar mark ($) of United States, is branded high up on the neck of colts by many breeders in the district of La Perche where the Percheron is bred. This monogram is high enough to be concealed by the mane and about half the distance between the ears and withers. The horses are not all branded, however, and the absence of a brand does not necessarily mean that the animal has not been imported, or that it is not a good one. Among other brands used by the French is a star on the neck, denoting that the stallion may stand for public service in France. Very few of these are sold out of the country. The letter "R" means that the stallion has been rejected because of moon blindness or thick wind. There are very few of these that are exported either. Hoof numbers are also used to identify imported horses, but these are not permanent because of the natural growth of the hoof. Some of the leading Canadian breeders have devised some schemes of marking and branding their Percherons that have called forth the praise of Secretary Dunsmore of the Percheron Society of America. These will probably be given readers of The Maritime Farmer in a later number when we have an opportunity to see the systems in actual practice in these studs.

The LOUDEN WAY To Prosperity
Louden Tools put farming on a scientific basis and make it a business of certainties. They stop waste of time, labor and feed and bring value of stable manure. They increase the output of your herds and your acres.
Louden's Sanitary Steel Stanchions
are flexible chain hung tubular steel. They are scientifically designed to make cows give more MILK PER YEAR. They allow the cow perfect freedom of movement and comfort, either standing or lying down. Cows are clean all the time. No corners or crevices; easy to keep clean. May be hung on homemade wooden frame if desired.
LOUDEN'S SANITARY STEEL STALLS make every part of the dairy barn light, airy and fresh—increase the cow's contentment and flow of milk and decrease the danger of disease.
Louden equipments include Louden Feed and Litter Carriers, Hay Tools, Fire Proof Barn Door Hangers.

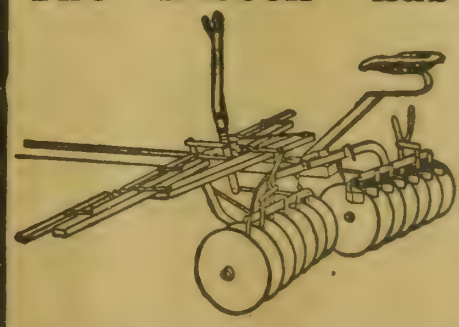
Sussex Motor Co. LIMITED

SUSSEX, N. B.

The "Bissell" has the capacity



Because of its capacity, time after time the "Bissell" Disk Harrow has done DOUBLE THE WORK in field competition against all competitors, under the same conditions.

The special shape of the "Bissell" plates cause them to enter the ground naturally and TURN THE SOIL EASILY. Steel scraper blades meet the Disk Plates chisel fashion and keep the plates clean of trash by movable clod irons—the only Harrow that has this feature.

Anti-friction balls (40) are used in the bearings, on every "Bissell" Disk.

The seat is placed back on the Harrow so that the weight of the driver when riding balances over the frame and REMOVES NECK WEIGHT. The hitch is well back, MAKING LIGHT DRAUGHT.

Search the Continent over and you will not find a Harrow with such cutting capacity, easy draught and correct proportions as the "Bissell." A postcard to Dept. M will bring you a free catalogue 64

POULTRY.

Infertile Eggs and Dead Germs.

Although still early in the season, I have already heard a good many complaints regarding the infertility of eggs, or else the death of the embroys during the three weeks of incubation. There are many reasons which might account for this unsatisfactory state of affairs. There is, however, one factor which must not be overlooked, since it probably goes to the very root of the whole question. In these days of the abnormal layer, are we not weakening the bird's constitution, and thus paying the penalty of the forcing system which is so much in vogue? Trap-nesting to select the most prolific layer, and breeding from her, and the same system continued with her progeny, and so on through many generations of hens, may possibly go too far, and an increased yield of eggs be secured at the cost of stamina. Thus is a weakened constitution handed down to the offspring, which will neutralise the laying qualities that they should have inherited.

This question is one that deserves the careful consideration of all those interested in the scientific aspect of poultry-keeping—we might say, the physiological side. How far can forcing of the laying powers go without causing bodily weakness? How many eggs may a hen lay and yet retain her stamina sufficiently to breed robust chickens, in which their parents' laying qualities will be perpetuated? Laying competitions have undoubtedly done a lot of good and aroused a great deal of interest throughout the entire country, and have given an outlet for the competitive spirit that is inherent in most English poultry-keepers. But are the competitions conducted on the lines most likely to ensure perpetual benefit to the industry? It has been repeatedly proved that the most prolific layers do not necessarily produce equally prolific stock; especially does this apply when pullets that have given a good account of themselves by taking a prominent position in a winter laying competition are bred from early in the year.

It is not, however, only among those birds that have been highly bred to increase egg-production that the trouble of infertility and dead-in-the-shell have to be contended with. It is often due to lack of forethought in the general management of fowls at a very critical period in their lives. As stated above, there are several causes. They may be briefly stated as follows:—Breeding from immature stock birds, over-feeding upon the wrong kinds of food, insufficient warmth and shelter during the winter. When the first of these causes is given as the reason for the failure in the hatching operations, the poultry-keeper frequently exclaims indignantly that he certainly does breed from pullets, but he is careful to get a two-year old cock.

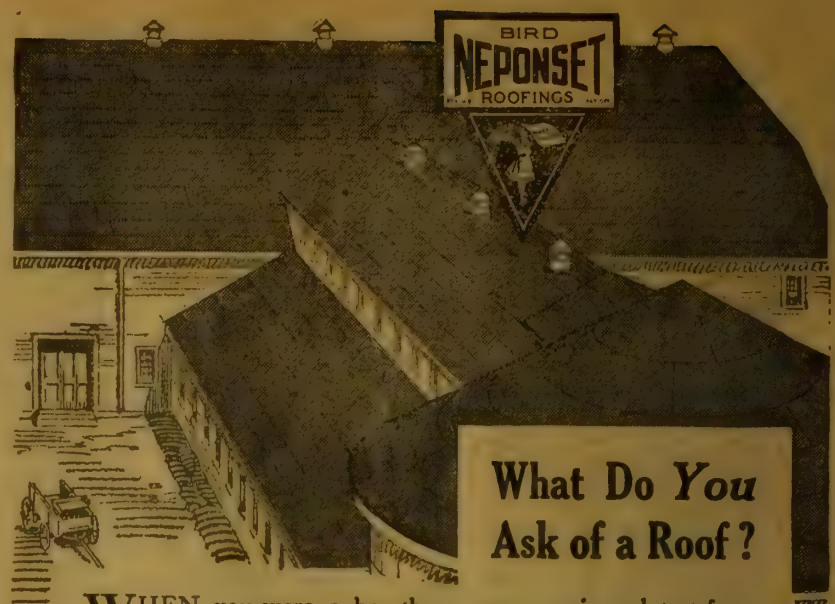
This may be perfectly true, and a most necessary proceeding, but the male bird's age must not be relied upon entirely to balance the evils of breeding from very young pullets.—E. T. Brown.

Soft Food for Breeding Stock.

A writer in a contemporary has made the definite statement that soft food is unsuitable for breeding stock, as it tends to force egg production at the expense or fertility and of vigor in the germ. Without committing ourselves to a complete acceptance of the thesis, we cannot but feel that under modern breeding conditions, with all the intensiveness apparently inseparable from methods necessary to profitable poultry keeping, and to the greatly increased production essential in these days, every aspect of the question should be studied to stop the leakages, one of which is the loss arising from the two causes named. A little reflection will show that there is probably more in this suggestion than at first would appear, and that, at least, it should receive careful investigation. Everyone will admit that the birds which give the most fertile eggs, containing the most vigorous germs, are such as are kept under natural conditions, and which have nothing in the way of special foods to induce egg-production. We have inclined to the opinion that this was mainly due to the greater amount of exercise and of oxygen, as a result of which the bodies are in harder condition. And, further, the majority of poultry-breeders will agree that soft food tends to overlay the internal organs with fatty deposits, which in their turn lead to infertility and germs deficient in vigour. On the other hand, breeders hold to the opinion that without soft food laying would be delayed, and consequently the period at which the chickens are hatched correspondingly retarded, which in itself would be harmful. But there is this much to be considered, namely, whether even if the period of laying be somewhat delayed the eggs would not be more fertile, the germs stronger, and the chicks when hatched grow more rapidly, so that the gain would be ultimately the greater. To obtain winter eggs for consumption it would appear that soft food is almost indispensable, but for breeding stock it may be altogether different.—E. T. Brown.

Backyard Poultry-Keeping on the "Philo" System.

In some of the poultry journals there has been much controversy as to a new kind of intensive poultry-keeping styled the "Philo" system, because it was originated by a man of that name, an American, who claimed to be able to keep fowls in strict confinement and still obtain the same good results as though they were allowed free range. For the benefit of those who may have little knowledge of the system I would point out in the first place that the fowls are never liberated from the moment they enter the house until killed off, so one decided advantage is that no ground rent, or very little, will have to be paid. The houses are 7 ft. by 3 ft. approximately, and built in two storeys. It is distinctly amusing to see the birds walking up a miniature ladder to the top storey, then hopping down again every few minutes, and this exercise keeps them healthy. Under the new system feeding arrangements have to be varied a little. Sprouted oats are given—i.e., oats moistened and allowed to grow 5 or 6 in. high. Dry bran is also given in fairly large quantities. Apart from this the feeding methods are on the ordinary lines; animal food has to be supplied, as none can be obtained indoors. Although we had a very hot summer, which was entirely against keeping fowls in confinement, the birds exhibited at the Crystal Palace, varying in age from a few weeks old to moulting hens, at the time of my visit all appeared in robust health, and I was given to understand that the system had worked better even than was anticipated by the promoters. The breeds to be kept in limited quarters will certainly puzzle some people, but so long as no great outlay is made at the start there will not be much to lose even if the affair ends in failure. Light colored varieties will do almost as well as the darker kinds, so there is nothing to dirty them so long as the floors are kept clean, and under such a system absolute cleanliness is imperative. Supporters of this new method believe that breeding operations can be conducted even on such a small scale, but I do not think they will be successful. When fowls have free range there is often a lot of trouble in getting fertile eggs and hatching strong chickens, but it looks as though this trouble will be much aggravated when the stock birds are kept in absolute confinement. Still there will be no harm in trying. If these artificial methods of poultry-keeping are successful there will be one of the greatest booms ever witnessed in poultry history, but I think that the system is one that will require expert management in order to bring about good results.—Farm & Home.



What Do *You* Ask of a Roof?

WHEN you were a boy there was *one* universal test for a roof:—"will it give protection against storm?" Shingles gave that protection, they were cheap—good shingle timber was plentiful and everyone was satisfied.

But times have changed. Roofing today must not only keep off the rain and snow, but should offer protection against fire as well. Farmers everywhere are quitting the shingle habit and turning naturally to

NEPONSET PAROID ROOFING

which gives better service than old-time shingles and costs no more than the poor shingles now offered. NEPONSET Paroid is used by the great railways because of the protection it gives against fire. Put it on all *your* farm buildings if you want to be free from worry over roof-leaks and repair bills, as well as from risk of fire from sparks. NEPONSET Paroid is guaranteed.

Write for Our Free Booklet on Roofing

It gives many interesting roofing facts and tells how many farmers are saving money by using NEPONSET Paroid and laying it themselves. We will also give you the name of the NEPONSET dealer near you.

NEPONSET **Proslate Roofing** makes a handsome reddish-brown roof for houses.

Valuable Book on Barn Building FREE

Write at once for this valuable book. It contains information that every farmer should have regarding the sanitary housing of dairy cows. It explains every fundamental of correct construction and gives proper dimensions and arrangements. It describes lighting, ventilation, stable floors, and their construction, and contains suggestions about silos, site, exposures, appearance, design, drainage and inside equipment. Besides, you will find in this book a number of practical barn plans and other information that may point the way to your saving many a dollar. We have designed many of the finest and most modern dairy barns in this country and this book is based on our long experience and expert knowledge in dairy barn construction. The book contains in concise, clear and condensed form, information necessary to any farmer who is planning to build or remodel. Understand, we send you this book absolutely free without any obligation on your part—just for answering these few questions: Do you intend to build or remodel? How soon? How many cows have you? Will you want a litter carrier? Will you want a hay fork outfit? Send to-day.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Now is the time to get rid of your rheumatism. You can do it by applying Chamberlain's Liniment and massaging the parts freely at each application. For sale by all Dealers.

Indian Runner Ducks.

For ten years I have been raising Rhode Island Red chickens, and I have always enjoyed raising them, and thought it impossible for anything to come nearer my heart than the little red hen, but I want to say that the Indian Runners have won out, as they have a way of getting into one's good graces at a very early age.

After the first day or two, you can almost see them grow. They gain so fast that at seven or eight weeks they are full grown to four and a half pounds. Where is the broiler that you can put four pounds on in that time?

Last year I hatched fifty-four ducklings, and raised fifty-two of them, so you can readily see that they are not hard to raise. I coralled them in a pen with twelve-inch poultry netting. Pen so constructed that it could be moved from place to place, as desired.

Their house was a piano box cut in two and covered with two-ply paper, using a screen door for the front, so that no animal could get to them at night.

A piece of tarred paper the size of your coop with strips of lath at each end makes a good cover for the bottom- and when this is covered with straw or coarse litter, it is easily kept clean. Pull out the paper, dump litter, and use water with broom to scrub the paper. This must be done every morning.

They are a contented bird, stand confinement well, and with ordinary care never learn to fly over a twelve-inch fence.

They are also intelligent and soon learn to scamper into the coop at night when you call, "To bed; to bed with you." Their heads pop up, they swing around a circle, and in they dart while you stand laughing at them.

One never tires watching them, especially when they have fresh water to play in. Although they are dry land ducks, they enjoy the water. A swimming pond or bath tub is easily made by getting a good tight box, warm it and pour melted paraffine into the cracks and crevices. This makes a water-tight tub, which is easily washed. Fill it and watch them play. You will have ample sport to pay for your trouble.

If you want to give them extra pleasure, give them green sprouted oats or lettuce. Swiss chard also is an excellent feed for ducks. This is grown in beds like lettuce, and heads cut off it will sprout up again from the root.

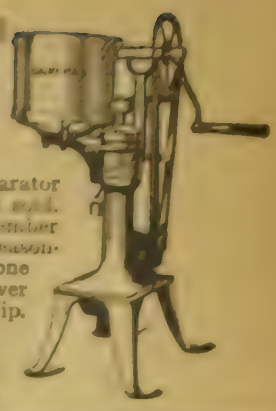
I have had more enjoyment and profit from my ducks than I anticipated. Mine are the 220-egg strain, almost solid fawn in color, and the eggs are pure white, weighing two pounds to the dozen.

If you want large eggs and plenty of them, if you want ducks of rare beauty, that are robust and hearty, if you want meat, sweet, tender and juicy, if you want a hatch that shows its worth, if you want a fun-maker on the farm, if you want a thing of beauty and a joy for ever, if you want to make a good round profit from a small investment, try Indian Runner ducks.—Avery Poultry Yards Manager, in Successful Farming.

If a drawn carcass has any distance to go, it may mould inside; or if a fly does not "blow" in it, there is a large exposed surface hidden from sight, which may become infected by some means during transit. If mouldy, sour, or fly blown, it is no longer saleable, at least for anything like a fair price, and it is not safe as food.

Dry-picked poultry will stand longer shipment than those that are scalded.

The Best Cream Separator is the Cheapest in the End



THE cost of manufacturing a cream separator determines the price at which it may be sold. Therefore, when selecting a separator, remember that the machines which are offered at an unreasonably low price can be offered at that price for one reason only—they are built to sell at prices lower than the cost of good material or workmanship.

Such separators are costly at any price. Only a good separator is cheap; not because of a low first cost, but because it will last for years and save enough butterfat from the milk of four or five cows every year to pay for itself. The best workmanship and material that money can buy are used in making

I H C Cream Harvesters Dairymaid and Bluebell

You will find an I H C the cheapest separator you can buy, because it will do better work and last longer than any other separator.

Go to the nearest I H C dealer who handles these separators and see how carefully they are made. You will find that they have phosphor bronze bushings—that the gears are spiral cut—are entirely protected from grit and milk, and at the same time are easily accessible.

The neck bearing is trouble-proof. The patented dirt-arrester chamber removes impurities before separation begins. These separators are made in four sizes. Ask the I H C local agent to show you one, and give you a catalogue, or, write the nearest branch house for catalogue and any other information desired

Raise The Crop That Never Fails

Just sit down and write us for full particulars of the best business proposition you are likely to hear this year. Let us tell you, in plain words, how very little money will start you in the profitable business of poultry-raising The Peerless Way. Let us show you why it will pay you well to adopt the Peerless methods, to make use of the advice and aid of the Peerless Board of Experts—pay you well, and profit you speedily.

One PEERLESS user will sell 200-000 fowl this year

Scores and hundreds—twenty thousand people in fact,—all over Canada, are following The Peerless Way to their profit. More than eleven million dollars' worth of eggs were sold in Canada last year. Yet with all this output prices stay high for every sort of good poultry and eggs. The market is far bigger than the present product—and it grows bigger day by day. Poultry-raising is the best business for any farmer, any farmer's child. Pays better for the time and money invested. Profit is surer. Isn't overcrowded—and never will be

Poultry ought to be a side-line on every farm —

The poultry-crop is the one crop that never fails. Every farmer certainly ought to make poultry a side line, at least—it is a certain profit for him, no matter how bad a year he may have with his other crops. And the Peerless customer need feel no worry about finding a market for all he wants to sell in the way of poultry or eggs. We look after that for him. We find him a buyer who pays the best market prices in spot cash.

Your credit with us makes it very easy to start —

Your credit is perfectly good with us. You can equip yourself fully for successful poultry-raising, and you don't need ready money to do it. We trust you; and we will make the terms so easy for you that you will never feel the outlay. In fact a Peerless Outfit pays for itself and quickly, too

Let us ship you this. We will trust you with it, show you how to succeed, and give you a 10-year guarantee.

Within a month or so from this very day, you could have a poultry-for-profit business well under way.

Write and ask us to prove to you that success with poultry, The Peerless Way, is possible for anybody of good sense in any part of Canada. Get the facts about it. They are facts that will probably be new to you. Send for them—it's for your own benefit we suggest that you send for them at once, without another day's delay. Just use a post card, if you haven't a stamp handy—put your name and address on it—say 'Show me'—that's all that's necessary.

PEERLESS users get valuable help and service free—

Besides finding a buyer for our [illegible] poultry products [illegible] we do that at any time we want to, our Board of Experts stands ready always to [illegible] practical suggestions [illegible] to Peerless users. These practical men have given [illegible] the greatest [illegible] business in Canada. The Poultry Yards of Canada Limited [illegible] experimenting in the [illegible] ries of the great plant [illegible] the Peerless [illegible] and proved it [illegible] the most [illegible] in use [illegible] for use in every section of the Dominion

More than 20,000 PEERLESS users are successful —

Poultry-raising with the difficulties taken out of it—that is the reason why The Peerless Way has proved profitable for over twenty thousand people scattered all over Canada. There is not a reason on earth why it would not be just as successful for you as it has been for the many successful of them. No matter where you live, farm is, and what you want, The Peerless Way—and we will help you beyond mere [illegible] in poultry farming either

Send right away for interesting offer and FREE very valuable information.

You will know why The Peerless Way is the best to get profit from poultry when you have read the big and [illegible] free book we want you to ask for. When the book will come [illegible] to tell you for poultry profit on terms that will meet your wishes and fit your means. Please write and ask for this now—make your start now—it will pay you to.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

I Will.

I will start anew this morning
With a higher, fairer creed,
I will cease to stand complaining
Of my ruthless neighbor's greed:
I will cease to sit repining
While my duty's call is clear;
I will waste no moment whining,
And my heart shall know no fear.
I will look sometimes about me
For the things that merit praise;
I will search for hidden beauties
That elude the grumbler's gaze.
I will try to find contentment
In the paths that I must tread;
I will cease to have resentment
When another moves ahead.
I'll not be swayed by envy
When my rival's strength is shown;
I'll not deny his merit,
But I'll strive to prove my own.
I will try to see the beauty
Spread before me, rain or shine,
I will cease to preach your duty,
And be more concerned with mine.

Love's Barrier.

(Continued from last issue).

CHAPTER XXIII.
BREAKING IT.

"Audrey, if Lady Adela comes to us next month, I think I'll give a ball."

"What for, mummy?" asked Audrey, looking across the table and poising a bit of biscuit between her fingers. They were at a tete-a-tete luncheon, and, if the truth must be told, Audrey had very much enjoyed her solitary morning. There were times when she felt that she would like to get away from her lover—when his attentions were somewhat irksome. Audrey had not paused to analyse this feeling, which was certainly unusual in a newly engaged girl. She only knew that it existed.

"Why, just to let her see what can be done even in the savage north," said Mrs. Hayes impressively. "And I'll have Gunter down and do it properly. The county will come in now, of course. I wonder whether I could put it on the cards, 'To meet the Lady Adela Hunt?' "

"Why, mother, no; I'm sure you couldn't. I never heard of such a thing."

"I'll find out; one can't get to know everything in a place like this. I wish I had asked her more at Marienbad. I had lots of opportunities. I flatter myself I made a good deal of them, but, of course, there are always things that slip one's memory."

"I don't think I particularly want Lady Adela to come here, mummy. One would never get away from her; and, of course, though she was quite nice most of the time, it used to enrage me when she patronised you so openly."

"You must not say that, Audrey. Lady Adela is too well bred to do anything of the sort, even if I would stand it. Yes, a ball; we have plenty of room. I think it would be a success. Gerald was speaking to your father last night. He would like the marriage to be before Christmas."

"But I shouldn't, and it won't be," replied Audrey unexpectedly. "Why should I be hurried like that? He has nearly nine months' leave yet. Anything might happen in nine months."

Mrs. Hayes did not like the words, but decided not to take them seriously. Since they had come home Audrey had developed a kind of petulance, an unexpected rebelliousness, which incited her to unusual self-assertion. The time had gone for sharp measures with the child; she was almost a woman, and had become a person of the greatest importance.

"I'm not surprised at Gerald, I must confess. A man who has knocked about so long naturally wants to have a home. Don't be too hard on him, Audrey, or keep him waiting too long. Remember, he is not a boy, and that a certain amount of deference to his wishes is expedient."

"In this case it is my wishes that have to be consulted, and I'll marry him when my own time comes—if I ever do," Audrey said coolly, as she rose from the table.

"Don't be silly, child. Have you and Gerald quarrelled that he went off in such a hurry this morning?"

"No, we didn't quarrel; but Gerald doesn't like my dearest friends, and he talks as if it were a matter of no importance, as if I could forget or drop them to order. He will find I'm not like that. And he laughed at dear Miss Jane when we met her out yesterday; and sometimes I think him perfectly horrid."

"You must not forget that Gerald mixes in very different society than ours, dear. His point of view would, of course, be very different."

"It need not make him horrid and sometimes vulgar. The Duchess was not like that; Sir Anthony Brede isn't; Mrs. Secretan isn't; and all of them are quite as well bred as Gerald, or his aunt—and very much nicer."

Audrey, with colour a little high turned to leave the room. The outburst had relieved her of something that had been pent in her heart for several days.

"Where are you going now, Audrey?"

"To the Rectory; I've simply seen nothing of Mrs. Secretan. She never seems to be at home now. I am going to take Firefly in the cart; and you needn't expect me home to tea, for even if Mrs. Secretan isn't at home, I'll go on to the Court and have tea with Miss Jane."

"Gerald will not be pleased if he should happen to come up by the three o'clock train. He will expect to find you at home. Won't you go to the station, in time to meet that? And then, if he is there, of course, you will drive him back and not go to the Rectory."

"Mummy, I won't do that; it would be running after him. It's his duty to run after me, though I don't want him to. Try not to be angry with me, and do please leave me alone just a little. I'm so tired of it all."

Tears of something uncommonly like mortification were in her eyes; in truth, Audrey did not know what was the matter with her.

"I want a long talk with Helen, mummy. I shall be better after I've had it, so good-bye."

She kissed her mother rather quickly, and disappeared as if fearful lest she should be detained by fair means or foul. Mrs. Hayes, however, suffered her to depart without further protest, and, sitting down to her desk in the boudoir, proceeded to make out a preliminary list for the ball. The boudoir was a very gorgeous place, all gilding and blue silk brocade; but it was not an apartment suggestive of homeliness, and her husband seldom entered it. He had a little den of his own, where he often retired to smoke the comfortable pipe, and where Audrey was only too pleased to join him. Mrs. Hayes never went to the den. She protested that the odour of it made her head ache. She had not finished her list, and was regarding it with great satisfaction, when, about four o'clock, greatly to her surprise, her husband entered the room.

"Why, Geoffrey, you are home very early, surely! I suppose Gerald brought you back. Where is he? Audrey has been rather tiresome today. I'm afraid they have had a little tiff, and now she has gone off to the Rectory. You didn't meet her, I suppose?"

"No, I didn't meet her," he replied, and relief was evident in his face.

He stepped back and carefully closed the door. Mrs. Hayes, leaning back in her chair with her gold-tipped pen in her fingers, now observed that her husband looked rather worried. "Where's Gerald?" she repeated. "Hadn't I better go down and explain about Audrey?"

"He isn't here, Maria. He is not coming back. Everything is off between him and Audrey."

Mrs. Hayes gave a small scream.

"Everything off! Whatever are you talking about, Geoffrey? It's impossible. They've had a lovers' quarrel, that's all. I saw there was something the matter with Audrey this morning. But he'll come back, and she'll apologise, and everything will be all right. Where is he? I must try to see him. How dare you stand there and torment me like that?"

"It is nothing of that kind, Maria; so far as I am aware there is nothing wrong between Hunt and Audrey—at least, he said nothing. I've found out something to-day which makes him, in my eyes, an unsuitable husband for our girl. I have told him so, and that's the end of it."

"Geoffrey, what was it? Tell me at once. How terrible! I can't believe it. He has been a perfect gentleman to me—to us all—ever since we have known him."

"I am sorry I can't tell you the whole story. I'm afraid I must ask you to trust me absolutely in this, Maria. Surely you may rely upon my judgment, and trust my love for the child?"

"You must tell me at once, and everything, Geoffrey," she said firmly. "It is my due. I shall be satisfied with nothing less."

"I can't, Maria. I have passed my word. So far as I am concerned the story I heard today is dead, and I am the grave of it."

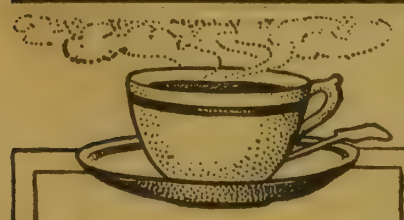
"Was it a man or woman who brought the trumped-up thing to you, Geoffrey? You know what you are! Any baby could take you in. I assure you I have no intention of sitting down under this, or of breaking off such a desirable match for Audrey for such a trifle."

Geoffrey Hayes made no reply.

"Was it a man or woman?" she repeated; but he ignored the question.

"You spoke to Gerald, then?" she went on, her voice becoming more shrill and harsh in her desperation and chagrin. "What did he say?"

"He denied nothing, and when he saw that I was fully determined he simply aquiesced in my decision. He went off to London by the three-ten, and his things must be packed and sent down for the evening train."



The Bitter Chaff Removed

The men who blend, prepare and pack Red Rose Coffee know well what will please good judges of coffee. They crush — not grind — the fresh-roasted bean into small, even grains which brew readily and settle quickly to pour bright and clear. The chaff is removed, and with it the bitter essence you have disliked in other coffees. You will surely like

CRITICAL TIME OF WOMAN'S LIFE

From 40 to 50 Years of Age. How It May Be Passed in Safety.

So. Wellington, B.C.—"For a year during the Change of Life I was all run down. I was really too weak to walk and was very despondent and thought I was going to die, but after taking Lydia E. Pinkham's Vegetable Compound and Blood Purifier my health and strength returned. I am very thankful to you and praise your medicine. I have advised several women who suffered as I did to try your remedies. You may publish this if you wish."—Mrs. DAVID R. MORRIS, South Wellington, Vancouver Island, B. C.

No other medicine for woman's ills has received such wide-spread and unqualified endorsement. We know of no other medicine which has such a record of success as has Lydia E. Pinkham's Vegetable Compound. For more than 30 years it has been the standard remedy for woman's ills such as inflammation, ulceration, tumors, irregularities, periodic pains and nervous prostration, and we believe it is unequalled for women during the period of change of life.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

PANDORA RANGE

Seeing this splendid range places you under no obligation to buy. We guarantee the "Pandora" just as willingly as McClary people because we know its perfections just as thoroughly.

TORONTO CANADA 1

Mrs. Hayes collapsed in her chair; chagrin, disappointment, bitterness were all expressed there, but no concern or relief. Geoffrey Hayes' heart ached as it had often ached through the somewhat empty years, because there was no sympathy or understanding in the woman who had walked by his side so long. Her thoughts were not his thoughts, nor her ways his ways; even the child of their love was not the bond she might have been between them.

"And will this be the end of it, Geoffrey? Think of the scandal, the disgrace! And what will Lady Adela say? She was so gracious and so kind."

"That has nothing to do with the case, Maria," he answered wearily. "All we have to concern ourselves with is that Hunt is not the husband for Audrey, and that, thanks to the disinterested and loyal affection of a friend, we have discovered it in time. I have no room but for thankfulness in my heart."

"Who was the friend?" she asked quickly, hoping even yet to catch him unawares, though she recognised in his quietly determined manner the mood seldom shown, but against which she was powerless to assert herself.

"I am not at liberty to tell you. Audrey has had a narrow escape from what would most assuredly have been an unhappy and disastrous married life. I am very thankful, and it will be a lesson to us, I hope, to keep in our own station, among the folks we have known, and in whose lives there is nothing to hide."

In these words Maria Hayes heard the death knell of all her ambitious hopes. She burst into tears, which were very real, but the tears were for herself. Her husband knew that, and did not seek to wipe them away. For once a little hardness towards her crept into his heart, and he turned away.

"Audrey is at the Rectory, you say? How did she go?—on her bicycle?"

"No, she is driving Firefly in the cart. I must say you are behaving in a perfectly horrid way, Geoffrey. You don't seem to realise what this means for us; how it will humiliate us everywhere. I shan't be able to hold my head up for ever so long."

"I shall be able to hold mine higher than ever. Try to look upon the merciful side of the thing. You would not have wished Audrey to marry a man and be unhappy ever after."

"No, of course not; but she would not have been. He was such a perfect gentleman. And, Geoffrey, don't forget that your standard is very narrow and provincial. People who move in Lady Adela's sphere don't take quite the same view of things. I could gather that from lots of things she said. And, after all, even if he has done something wrong, he ought to be forgiven, even the Prayer Book says that. He was so fond of Audrey, too; she could have made him a better man supposing he needed to be made better."

Geoffrey Hayes merely shook his head, and, after regarding her for a moment with a sort of wistfulness, quietly left the room. His own heart ached intolerably, though he could not have told why. Most of all, perhaps, he felt for Helen Secretan.

Presently he looked into the boudoir again.

"I'm going down to the Rectory to fetch Audrey. I'll tell her on the way up. Try not to let it worry you too much, and keep uppermost the thought that we have saved our girl from an unhappy married life."

But Mrs. Hayes refused to be comforted; and while her husband struck across the fields on foot to Midcar Rectory, she, sitting among the ruins of her ambitious hopes, sought eagerly for a way out. She began a letter to Lady Adela, begging her intervention and her help to clear up the strange mystry which had culminated in such disaster.

He arrived at the Rectory only to be informed by Bates that Miss Hayes was not in the house, and that his mistress was lying down.

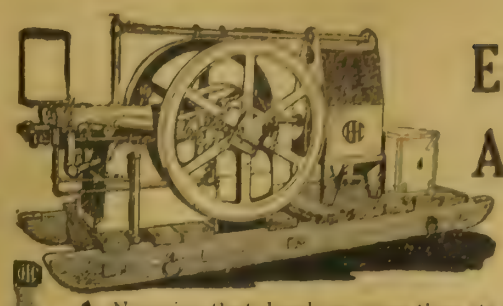
"Yes, sir; the Rector is in. Please come in," he said; and Mr. Hayes followed him to the study. Secretan was there alone, sitting in his armchair at the desk, apparently lost in thought.

At sight of the visitor he rose, and tried to appear cordial and interested. Geoffrey Hayes thought he seemed pale and out of sorts.

"I'm seeking Audrey. Her mother told me she had come here, but the page tells me she has gone off again."

"She called about three, but I did

I H C Engines Furnish Ample Power at Lowest Cost



AN engine that develops more than its rated horse power, with the lowest possible expense for fuel, needs only one other feature to make it the best engine a man can buy. That feature is durability. The engine which combines these three qualities, ample power; low fuel cost, and durability, is an

I H C Gasoline Engine

In an emergency, an I H C engine will develop from 15 to 30 per cent more power than it is sold for. Because of its scientifically correct mixer, it uses less gasoline to develop that power than is required by any engine not so equipped. It is durable because only the best material is used, put together with the precision of a high-priced watch. For work on farm or estate, in mill, shop, or factory, wherever reliable, dependable power is required, an I H C engine is the one best buy.

I H C engines are made in every style—horizontal and vertical, air and water-cooled, stationary, portable, and mounted on skids, to operate on gasoline, kerosene, distillate, or alcohol; sizes 1 to 50-horse power; kerosene-gasoline tractors, 12 to 45-horse power. Sawing, spraying, pumping, grinding outfits, etc.

The I H C local agent will show you the good points of the I H C engine. He will explain why an I H C engine is durable. He will show you how simple it is. He can give you good common-sense reasons for buying an I H C engine in preference to any other. Get catalogue from him, or, write the nearest branch house.

Ocean Limited Early on Route.

SUMMER TIME CHANGE ON INTERCOLONIAL RAILWAY JUNE 2.

The summer change of time on the Intercolonial Railway will go into effect on June 2nd, when the famous Ocean Limited will be placed on the route between Montreal, St. John, N. B. and Halifax, N. S. with connections for and from the Sydneys and Prince Edward Island in anticipation of an early rush of summer travel. The time schedule is expected to be practically the same as last year, which means that the "Limited" will leave Montreal at 7.30 p.m. reaching Levis at midnight, and giving through passengers the opportunity of seeing the famed Matapedia Valley during the earlier hours of the morning and a view of the Restigouche River and the blue waters of the Baie des Chaleurs. The beautiful valley of Wentworth, N. S. will be seen in the more mellowing light of early eventide, and the train will reach Truro at 8.00 o'clock connecting with the through night express for the Sydneys and arriving at Halifax at 10.00 p.m.

The Maritime Express under the summer schedule will leave Montreal at 8.15 a.m. and through passengers will have the daylight journey through Quebec, and a view of the majestic St. Lawrence as it widens in its course to the sea. Making connection at Moncton with morning express for St. John the Maritime continuing eastward will reach Halifax at 13.30.

The Ocean Limited will leave Halifax westbound at 8.00 a.m. and the Maritime Express will leave as usual at 15.10 thus there will be a through week day service by two trains equal to the best on the continent.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

not see her, and my wife was not at home then. Won't you sit down, Mr. Hayes? It is unusual to have an afternoon call from you."

"Oh, quite. A most unpleasant thing has happened with regard to Audrey, Secretan. Her engagement with Major Hunt is off."

Secretan started, and his furtive eyes eagerly sought to read the expression on the face of Geoffrey Hayes.

"Off! Off!" he repeated. "Why, what has happened?"

"I have learned that he is an unsuitable husband for my girl, and I've told him so. He accepted his dismissal, and has gone off to London. I need not say more; perhaps you can fill in the blanks. I wish to Heaven we had never seen them. It was my wife's doing, Secretan. I wonder how it is that women are so seldom pleased with the station to which it has pleased God to call them, but torment themselves and everybody else by fighting and struggling for something different."

Secretan made no response. His heart was beating dully; and the cloud, at first no bigger than a man's hand, was now threatening to obscure his whole horizon. He was in torment; had been, indeed, since he had seen his wife and Gerald Hunt in Mardocks Wood; and now, more than ever, he was at sea.

"Now I have to tell Audrey," continued Hayes dully. "I'm hoping her native good sense will come to her aid, and that she won't mind. Ghastly business, isn't it?"

"Oh, very," replied Secretan vaguely, then turned away. There was a moment's awkward silence, then it suddenly flashed upon Geoffrey Hayes—and he could have cursed himself for the stupidity which had prevented him seeing it before—that there were wheels within wheels; and that probably Helen Secretan's heroic frankness would cost her more than any of them knew. He had never seen Secretan look like that; his face had lost its frank, pleasant outline; his very tone was morose and sullen.

Hayes almost shivered as he withdrew into himself. It was a ghastly situation. Bound to silence by Helen, not knowing how much or how little the Rector knew of her story, he could do nothing, nothing at all, except take himself off, and pray that these tangled threads might be unravelled by some more skilful hand than his. He would see Helen again one day, of course, and, if he dared, would question her about her husband. But it was a task little to his liking. He was a shy man, and cherished the old-fashioned ideas about the sanctity of married life. To lift the veil even for a moment to the prying eye was, in his estimation, to change it from a sanctuary to a vulgar place.

"I expect Audrey went straight home again, then," he said awkwardly. "I must go and find her. Goodbye, Secretan; sorry I intruded with my troubles. Life doesn't seem to get easier for us as we grow older."

"No," said Secretan dully and hardly. "It gets harder—much harder."

For the first time in his life, perhaps, Hayes felt himself at a loss; he could not find the fitting word. More than most men, he possessed that fine large gift of personal tact which can always throw itself into the breach. But to-day it deserted him. He felt glad to shake hands rather quickly and to leave the Rectory. He was conscious of an awkwardness; he did not know what to do or say. He must continue to feel this, he was aware, until he had seen Secretan's wife again. He remembered, now, that he had been selfish throughout that trying interview at the Mills; he had not once thought of Helen really, or of the possible difficulties the position she had taken up might create with her husband.

New Vitality For You

USE THE

Free Coupon

Vitality gives you the manly courage to protect those depending upon you, as portrayed in the picture. No matter what thoughtless action or early indiscretion may have sapped your strength, vitality restores it to you. It makes you over into a strong, vital, manly man, without an ache, pain or weakness. Vitality puts the real VIGOR OF YOUTH into your blood; no matter how nervous or debilitated you may be, it puts the sunshine of vigorous manhood into your life; I make you feel young and keep you feeling young, without the use of drugs, without the necessity of dieting, without one bit of change in your present mode of living, except, of course, dissipation must cease. Just lead a manly life and use my HEALTH BELT; everything else will come: My HEALTH BELT, worn at night, pours a great, soft stream of VITAL STRENGTH into your blood, nerves and organs during all the hours you sleep; in one night it takes the kink, pain or weakness out of your back, ere long friends will be saying: "How well you look," and you are answering: "Never felt better in my life!" Your eyes will sparkle with health; you will have that pleasing influence to fascinate and control which comes to all full-blooded, strong, vital, manly men. Thousands upon thousands are now using my Health Belt all over the world. With special attachments it cures rheumatism, kidney, bladder, stomach disorders, etc.

Let Me Send You This Book Free....

Here is my latest illustrated book: "Health In Nature," containing a fund of private information relating to weakness of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely no obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

"ORANGE LILY SAVED MY LIFE"

These words or expressions having the same meaning are contained in hundreds of the letters I have received during the past year. Many were from women who had suffered agonies from falling of womb; others from women who had escaped dangerous surgical operations, as the tumors and ulcers had been removed by the action of Orange Lily; and others who had suffered from suppressed menstruation, leucorrhoea, painful periods, etc. For all these and the other troubles known in general as Women's Disorders, Orange Lily furnishes a positive scientific, never-failing cure. It is applied direct to the suffering organs, and its operation is certain and beneficial. As a trial actually proves its merit, I hereby offer to send, absolutely free, a box worth 35c., sufficient for ten days' treatment, to every suffering woman who will write for it. Enclose 1 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

Secretan did not offer to accompany him even to the gate, and as he passed through it alone, the sharp click of a pony's hoofs on the hard road and the tinkle of belled harness filled him with sudden exhilaration. He hoped it was Audrey's turnout, and it was. She drew up sharply, surprised at sight of him; but filled with an evident joy.

"Papa, whatever are you doing here at this hour of the afternoon, and where is Gerald?"

"I had to come home earlier. I may get in, I suppose? I am so glad to find you are driving alone."

"Get in, of course. This is the first bit of luck I've had to-day, positively it is. I called here when I came down first, and Mrs. Secretan was not at home. Then I went out to the Court Farm to find myself de trop there. Get in quickly, you lazy daddy! I have the most wonderful news for you. It will positively make mother's hair stand on end."

Hayes hardly smiled. He feared the shadow that must quickly descend on that bright, speaking face. If he could have spared her he would.

Before he stepped into the cart he asked her to move down and let him take the reins.

"But why, daddy? I like driving myself, and Firefly likes it, too. I'm not at all sure that he will approve of your hand on the reins.

"I'd like to try him, dear, for a mile or so."

Audrey obeyed, but betrayed her surprise and dissatisfaction.

"Well, for my news. When I got to the Court Farm, who do you think I found there drinking tea with Miss Jane?"

"I don't know, I'm sure."

"Why, Sir Anthony Brede, and I'm nearly certain he has asked her to marry him and that she has said 'Yes'! They as good as told me. Did you ever hear of anything so delightful? I shall positively love telling mamma; and don't you agree that it will make her hair stand on end?"

Hayes faintly smiled. It was rather an astonishing bit of news, but he was too preoccupied to estimate it at its full value.

"Well, when you come to think of it, it isn't at all an unsuitable match; and Sir Anthony shows his good sense."

"I think it's too lovely for anything. I'm simply dying to hear what Mrs. Secretan thinks about it. Well, and what have you done with Gerald?"

"Gerald," said Hayes slowly, "has gone to London."

"To London! But why? He didn't say a word about it this morning."

"No, he would not, for he did not know then that he would be going. Steady boy! Don't ask me any more questions till we get beyond the village, dear. What a nuisance these stray curs are! The place is infested with them."

Audrey looked puzzled, and in a few seconds they cleared the last house in the village and were out upon the open moorland road.

Then Geoffrey Hayes slackened his hand on the reins and turned to look Audrey full in the face.

"My little girl," he said unsteadily, "you believe, don't you, that your old dad loves you, and that he would lay down his life for you, if need be, cheerfully?"

Audrey did not answer immediately; a sort of slow apprehension gathered in her eyes.

"You will believe that he would not willingly do anything to hurt you or to make you unhappy, don't you, Audrey; and surely you can trust him, can't you?"

"Why, yes daddy. But what does all this mean? Something has happened. What is it?"

He turned once more to look her quite fully in the face.

"Gerald has gone to London. I have sent him there, and he will not

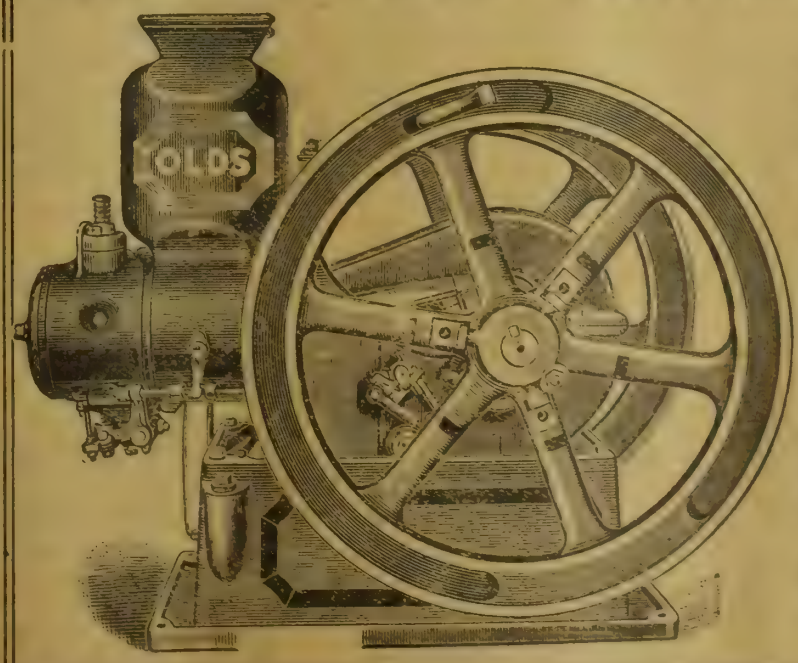
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

come back. The marriage will never take place. You will be a brave girl, won't you, and meet it in the right spirit? Because—because it is going to be the best thing for you."

"Has he—has he tired of me, then?"

"No, no. It is hard for me to explain. Indeed, I can't explain, my darling, except this. He is not worthy of you. I have learned that. He would never make you happy. Better—far better—a little heartache now than years of misery. You will not make it harder for me, Audrey? I have to ask you to trust me to the uttermost. I can't answer your questions."

She was so long silent, looking across the purple shadowland of the moor, that presently he drew up and put an anxious arm around her.

Then the floodgates of her heart were opened, and she sobbed upon his shoulder unrestrainedly.

"I—I don't want to marry anybody, daddy. Keep me beside you always. I don't want anybody but you." And before they reached High Ridges, Geoffrey Hayes knew that relief was the uppermost feeling in his girl's heart.

(Continued in next issue).

"Moses in the Bulrushes."

"Oh, mamma, look-a-here! look-a-here! cried a childish voice, shrill, yet half chocked with laughter. "Mamma, where are you?"

"Here on the porch," called the mother, smiling in sympathy with the merry sound. A moment later two girls came rushing through the long hall to where she sat in the cool shade.

It was the first Monday of the summer vacation, and all the time while the mother was toiling over the "week's wash," that hot June morning, she had been thinking how good it was to have the girls—aged seven and nine—at home to care for year-old baby Dene. The hard, hot work was all done now, however, and she settled herself for a good rest ere getting dinner, when May's merry call aroused her.

As they came into view, a wave of vexation swept over the mother, but she could not help smiling at the forlorn looking object Daisy, the oldest, was holding towards her at arm's length. It was baby Dene, but so wet and bedraggled, so covered with black mud, as to be utterly unrecognizable,—not much like the clean, white-robed child the girls had taken with them to the meadows back of the garden three hours before.

"This is Moses, mamma," giggled May, and the baby swung his arms and chuckled in concert. "The Jiption Princess found him in the bulrushes." Here all three shrieked with laughter, and the baby wriggled from Daisy's hands into his mother's lap.

"What are you talking about, May," demanded Mrs. Smith, trying to be stern—but the dimple in her cheek betrayed her shamelessly as she began taking off Dene's wet clothes.

"Well, you see, mamma," began May apologetically; "it was like this: We played with baby till he went to sleep, and everything we could think of till he woke up. Then in poking around the big bunch of rushes on the edge of the cowslip patch, I found an old basket. Then I thought of our Sunday school lesson and I said to Daisy, 'Let's play Moses in the bull rushes.' She said, 'All right,' so I was the Hebrew mother. I put Dean in the basket real nice, hid him in the bulrushes, and then laid down in the tall grass and watched the way the mother did in the story."

"But, my dear," interrupted Mrs. Smith, "wasn't it wrong to have baby there in the water? He might have drowned."

"Oh, mamma, there wasn't any water—not so much," and May measured a fraction of an inch on her finger, while Daisy took up the story.

"That was so, mamma, for I was the 'Jiption Princess, and as I came down to the river to bathe I said to my maids—I played there was a lot of them with towels and soap and things—I said, 'There isn't much water here,' and they said, 'If your gracious Highness will come beyond the rushes, your imperial grace will find more.' So I went on and I found the infant Moses in the bulrushes, and—"

"Oh, mamma," interrupted May, again convulsed with laughter at the remembrance, he had crawled out of the basket and was playing in the mud, just tickled to death. He had dug his hands in it and rubbed his face, and he was so mad when Daisy rescued him that he just kicked and squealed. But we laughed so hard he had to laugh too, and oh, Mamma, didn't he look cute? How I wish papa could have seen him!"

Two of Mrs. Smith's neighbors had come up in time to hear the whole laughing recital. One listened with a cross, disappointed look, the other smiled broadly.

"I'd give both those girls a good whipping if they were mine," declared the one, as she eyed the disreputable-looking baby, who was smacking his lips over his dinner, pausing now and then to giggle his enjoyment of the situation, and wiggle his muddy toes out from beneath his mother's enfolding apron.

"Not I," declared Mrs. Smith, with a merry laugh. "This is the best joke that ever happened to baby Dene. To be Moses in the bulrushes' and rescued by a princess, with a mud bath thrown in, is an experience that doesn't come to many infants of his tender age. The mud bath was an accident, and without punishment, the girls will see that it never happens again."

Mrs. Grant looked disgusted with such soft-heartedness, but the other neighbor, Mrs. Sawyer, nodded approval. The girls, who had listened with shocked faces to Mrs. Grant's suggestion, gave their mother a hug and kiss, then ran merrily off to prepare baby's bath and clean clothes.

Which mother's idea was best?—Mrs. Rye Johnson.

Individuality in the Child.

"O, you're not a mother, you don't know anything about this"

So said one sister to another while the two were considering a troublesome question in the family who made this remark.

"True, dear," was the reply, "yet do not forget that I am a child, though grown up, and shall always remember how I felt in experiences at our old home when the same principal was at stake as in this case now between you and your boy who just left the room, showing that he rebelled against your

Learn why PURITY FLOUR is unlike any other brand

PURITY FLOUR is unlike any other brand of flour. No two milling companies follow exactly the same process of milling. In fact, no two different brands of flour in the world are exactly alike in quality.

And here is another fact worth knowing: Every wheat berry contains both high-grade and low-grade portions.

The process of milling PURITY flour costs more than to mill ordinary flour. The low-grade portions are separated and excluded. PURITY is an ALL HIGH-GRADE, hard wheat flour. It has greater strength, greater absorption and greater expansion. It is a thirstier, more elastic flour. It drinks more water and expands into more loaves.

Use PURITY FLOUR for your next batch of bread. Count the loaves. You'll find you have made "MORE BREAD AND BETTER BREAD" from PURITY than when you've used an equal weight of weaker and cheaper flour.

PURITY FLOUR

"More bread and better bread"

IMAGINE, if you can, how much whiter, and more toothsome, and more nutritious, the bread made from such a HIGH-GRADE flour must be.

And can you imagine yourself enjoying the flaky pie-crust and the light, delicate cake?—your reward for using PURITY flour

When making pastry, please remember to add more shortening than required with ordinary flour—for on account of its extra strength, PURITY FLOUR requires more shortening for best pastry-results

Yes, PURITY FLOUR costs slightly more than ordinary flour. But use it once and you'll say it's worth more—much more—than the difference.

Add PURITY FLOUR to your grocery list right now.

I. S. JOHNSON & CO., Boston, Mass.

authority. Our beloved parents never had, as you have, the opportunity to learn that each child has an individuality of his own, and that if this is ignored or disregarded by parents, the child is discouraged or angered. If naturally timid and yielding, he is wounded and finally discouraged ; if independent and high-spirited, he is made resentful and hard-hearted.

"Further, in either case,,an estrangement sorely to be deplored, is sure to come between the heart of the child and the grown-up, and the implicit confidence, which the child must have in the parent if the right relations are to exist, is being destroyed by every such manifestation of defective insight and good judgement.

"Do you not think that you should in a kind way reason with the boy, not arguing, but giving him a chance to tell how he sees the matter, and, then guided by the spirit of God, explaining to him the principle involved? If he understands fully that he is to choose, reason, decide some things and then take the consequences, will he not soon become more willing to desire your opinion and to get you to tell him what is best? Often it will require more time, more forbearance, more seeking wisdom from above, than it does to give hasty, peremptory commands and then with harshness force outward compliance—for you know yielding is not obedience unless it is from a willing agreement with the parents and true confidence in them. Surely you do not wish to drive your child from you ; but a small gulf has begun and it will widen if you continue this way of doing.

The harm done can be counteracted, however, if you truly do as you would be done by, even though it is humiliating to you."

After a short silence the mother said, you are right, sister. I believe you have a true mother-heart and that you have received the teaching of Him, who is all-wise. I shall seek Him as I never have and do differently."—Sarah A. Bowen.

In the Kitchen.

A little nutmeg should be grated and mixed with the stuffing intended for a turkey or a goose. It will greatly improve the flavor.

If, when baking brown bread, a teaspoonful of treacle is added, it will be found that the loaves will cut quite easily without crumbling.

To remove inkstains from linen, put melted tallow on the mark, then wash out, when it will be found that both the ink and tallow have disappeared.

While frying Spanish onions always put a saucepan lid over the top of the frying pan, so as to keep in the steam and flavor. It will also make the onions cook quicker.

Knives should never be dipped in hot water, as is loosens the handles. The blades may be placed upright in the water in a jug, by which plan the handles will be kept dry.

Eiderdown quilts are apt to lose their lightness after being used for some time. To restore them, beat well with a cane beater, and hang on the line on a dry day for a few hours in the wind.

To beat the white of an egg quickly so that it will be stiff, be sure that the basin or plate is perfectly dry. If the process is carried out in the open air it is quicker.

To boil eggs for invalids or children bring the water to a boil, take the saucepan off the fire, and place the egg in it for five minutes. This will cook the egg perfectly without making the white hard and indigestible.

It would surprise you to know of the great good that is being done by Chamberlain's Tablets. Darius Downey, of Newburg Junction, N. B., writes, "My wife has been using Chamberlain's Tablets and finds them very effectual and doing her lots of good." If you have any trouble with your stomach or bowels give them a trial. Mr. _____ your Name
your Post Office your Province

WRITE your name and address in the lines above, clip out this ad, and mail it now. We will send, by return mail, a book that tells how to make yours a "Twentieth Century" farm.

You wouldn't be satisfied to use a scythe to cut your grain, when a modern harvester can do it so much better, would you? Nor to use the old soft-iron plough-share that your ancestors walked behind, when you can get an up-to-date riding plough? Every Canadian farmer realizes the advantages of Twentieth Century Implements.

The next step is

The 20th Century Material—Concrete

Concrete is as far ahead of brick, stone, or wood as the harvester is ahead of the scythe or the riding-plough is ahead of the old iron plough-share.

Concrete is easily mixed, and easily placed. It resists heat and cold as no other material can; hence is best for ice-houses, root-cellars, barns silos and homes It never needs repair; therefore it makes the best walks, fence-posts, culverts, drain-tiles, survey monuments, bridges and culverts. It cannot burn; you can clean a concrete poultry-house by filling it with straw and setting the straw afire. The lice, ticks and all germs will be burned, but the house is uninjured.

It is cheap—sand and gravel can be taken from your own farm. Cement, the only material you must buy, forms from one-seventh to one-tenth of the whole volume.

Do you want to know more about Concrete on the Farm? Then write your name and address in the lines above, or on a postcard, mail it to us, and you will receive by return mail a copy of

"What the Farmer Can Do With Concrete"

Not a catalogue, but a 160-page book, profusely illustrated, explaining how you can use concrete on YOUR farm.

FLORICULTURE.

A. M. C., Sussex Corner, writes:—Last year my Sweet Peas were covered with small green bugs; would you kindly advise me what to do, if they come this year?

Procure from the cigar factory three or four pounds of tobacco stems and steep them, in say, a gallon of water. After cooling, dilute to color of ordinary weak tea and syringe plants on both sides of leaves. A few applications will suffice. Do not allow this to come on the bloom or buds. The first few cold nights will effectually dispose of these pests and a good heavy rain is apt to destroy them.

S. E. G., Dorchester, N. B., writes:—I have several Tea Roses that were in pots, about five inches across, when I planted them. They have not grown much this summer until about a week ago when red sprouts seem to be coming out all over them. When should I repot them? What size pots should be used? How should they be treated after potting? Should some of the sprouts be picked off?

Repot the Roses as soon as there is the first appearance of frost, use as small a pot as you can getthe ball of roots into without shaking off any more soil than you can help. After potting, water thoroughly and place in a cool, shady place out of doors, where they can be protected from frosts and sprinkle the foliage twice a day, for a week. Every fine day as soon as the nights get cool take them in the house (this is fall treatment). Spray frequently, especially the under side of the leaves. By all means leave the sprouts untouched as upon these you depend for your blooms. Roses treated thus should bloom for at least, two months.

Begonias, flowering varieties, like a temperature of say 60 degrees at night and plenty of sun and moisture,

The Rex type requires the same temperature at night, no sunshine but strong light. Do not spray or sprinkle foliage or handle any more than necessary. Keep soil just moist. Use light soil and have perfect drainage. The Tuberous rooted Variegated, likes plenty of sunshine or will do out of doors in partial shade. It does best during the spring and summer and should be dried off during the winter.

The Parlor Asparagus, likes plenty of water on its foliage and only a moderate amount on the soil, partial shade and a warm room. It requires repotting frequently and if root bound is apt to lose its foliage.

H. A. M., writes:—What shall I get for my garden that I can have to cut for table use?

Hardy plants bloom earlier than most of the annuals and last from year to year. For annuals Rubena Asters may be cut freely and they will bloom again in a few weeks.

Live Stock Improving in Cumberland County.

Editor Maritime Farmer:—

Spring has come and the maple sap is running freely.

Last season, being very dry, crops were not so good as usual.

Our Agricultural Society is in a flourishing condition.

There has been a great improvement in the quality of live stock in these parts during the past few years. Well-bred Shorthorns, Guernseys and Jerseys are in evidence in every direction. There are also a few Ayrshires that are able producers at the pail.—Isaac Gray, New Annan, N. S.

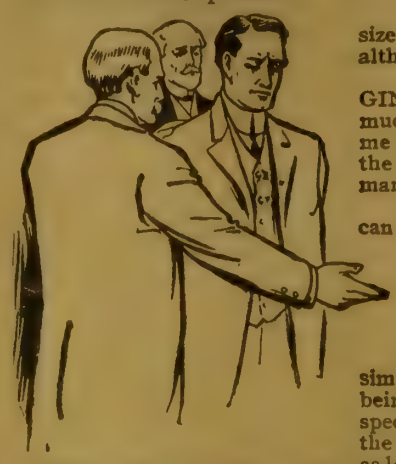
DOCTORS AFRAID TO OPERATE

Could Not Remove Stone From The Bladder. Gin Pills Enabled Him To Pass It.

JOLIETTE, P. Q.

"During August last, I went to Montreal to consult a specialist as I had been suffering terribly with Stone In The Bladder. He decided on an operation and was assisted by another doctor. They said the calculus was larger than a bean and too hard to crush, and that they could not take it out.

I returned home suffering greatly, and did not know what to do, but was recommended by a friend to try GIN PILLS. I bought a box and found relief from the pain at once. I took a second and third box of GIN PILLS after which I went back to the specialist.



THEY COULD DO NOTHING FOR HIM

He told me the calculus was reduced in size, still he could not relieve me of it, although he tried for two and a half hours.

I returned home and continued to take GIN PILLS as they reduced the pain very much, but I did not expect they would relieve me of the stone, but to my great joy, I passed the stone on October 3rd, and am now a well man and very happy.

I am sending the stone to you so that you can see for yourself what a great work GIN PILLS did for me. GIN PILLS are the best medicine in the world and because they did so much for me, I will recommend them all the rest of my life".

J. ALBERT LESSARD.

Isn't it wonderful? Just think of these simple pills, that even children can take, being able to perform what the greatest specialists in Canada could not do. Surely, the days of the miracle have not passed away, as long as we have Gin Pills. These wonderful pills dissolve stone in the bladder or kidneys because they are a natural solvent for uric acid, which causes calculus. If GIN PILLS are not sold in your neighborhood, send us 50c. for a box or $2.50 for 6 boxes. Sample free if you write us mentioning this paper. National Drug and Chemical Co. of Canada Limited, Dept. M F Toronto.

MANGA-TONE BLOOD AND NERVE TABLETS are especially for women and girls to make them well and strong and rosy. 50c. box. 113

SALES HAVE INCREASED MORE THAN ANY OTHER

It is a well-known fact that, during the last three years, the sales of

EMPIRE

Cream Separators

have increased more than the sales of any other cream separator. There must be some reason or reasons for this great showing. These are some of the reasons:

Empire Separators skim to a trace. There isn't a machine made their equal for close skimming under difficult farm conditions.

They are easy to clean. They don't spatter oil. And they have anti-splash steel supply tanks.

So nearly frictionless they almost run themselves. Children delight in operating them, and can easily do so with perfect safety.

They are durable. Years of service have proven their true worth. Their cost per year of service is less than any known separator. Years in advance of competing makes.

Your choice of the two standard methods of cream separation. We make both cone and disc machines. Both are fully explained in our latest catalogue. Send for a copy. Get reliable, accurate information on the subject. 31

EMPIRE CREAM SEPARATOR CO. OF CANADA, LIMITED.
Winnipeg, Toronto, Montreal, Sussex.

Agents everywhere in Canada—Look for the Empire Sign.

Marsh Hay.

There are many things written for the farmer, showing the best method of doing things, but still we find many men all around us working in the same way as their fathers. I suppose farming is like many other callings, for instance, religion, law, medicine, &c. We have colleges, libraries, and great staffs of men preaching and teaching the different departments; yet, the most of us do not know very much about those questions, so I suppose the best we can do is as the poet says, "Sing them over and over again."

The following points I think are well worth our attention.

We often hear it said, "do not feed the stock any Marsh Hay; it is a very poor article, and no thrifty farmer can raise good cattle with it."

They say, "feed good, upland hay and then the stock will be worth more." I have fed both marsh and upland hay, and I believe I can make as much out of the marsh hay stock and perhaps more than I can out of those fed on upland hay, considering cost and value of the upland hay. Now, I say this, raise all the upland hay and stock you can, and then in addition to that raise all the marsh hay and stock with it, that you can. You can do it in nearly the same time.

The marsh hay will make second class manure; it will raise two or three good crops, and will help you to get more upland hay.

We keep the young stock in pens during winter. We throw in the hay broadcast and they seem to eat it up better than when tied in a stall, especially, if you feed a little sparingly at first. The cattle keep clean and do better than when tied. The liquid is absorbed and makes the manure good. But you need a number of pens for the different ages. We open the door for them to go to watering place and close it on return, so you see there is not much extra work, when tending the other good stock.

Here is the main point: Cut the marsh hay early, when it is worth as much again as when cut late. You see most marshes grow as soon as upland and if it is left late, it becomes over ripe, woody and fibrous, and the mornings are getting short, the marsh will not get dry until late in the day and the hay will get a swampy and disagreeable odor, and will then be a very poor quality of feed, as we know clover or timothy cut late in the fall is a very poor article of feed as well. It is said that if marshes are cut early, they will not bear as much, though I do not see much difference. If even so, we would do better to have less and get it a good quality.

A dam should be kept at the foot of the meadow and the flood gate should be closed to over-flow it early by catching the fall freshet, and in spring as well. The wash from the highland is a great fertilizer for the marsh. If no dam, the wash from the hills would mostly run down the brook and be lost. Do not drain a marsh very much as it will not grow as much hay, unless dry enough to be cultivated. Drain just enough to keep the water off the surface, then a while before making the hay open the drain. Now, we know it costs to raise upland hay, but very little to grow marsh hay. All we have to do is to go and get it. I would say, get all you can of both marsh and upland hay and you will find that the marsh will help to increase the business of the farm.—W. A. Hebb, Bridgewater, N. S.

Seed Corn Testing.

The first essential of successful Corn Growing is the planting of good seed. Good Seed Corn is scarce this spring. The wet fall resulted in much soft

"I want to Tell You a Big Secret of Building"

DEAR FRIEND:

I am sitting here at my desk, thinking how I shall write many people. I am an old man now—70 years old. 50 long years of my life were given over to making a perfect roof for any kind of building (for everybody has to use roofs), and the right roof works day and night to help a man's daily work.

A roof on a building is the weak link in a chain. Good foundations and good timbers rot—good products stored under a poor roof are spoiled because the roof doesn't protect. I want to stop that big waste. After years of work, I now know how to do it.

I worked for a long time to get a roof that could be easily laid by anybody. It had to be neither too heavy nor too light. It had to be smooth and clean. It had to be a real water shedder, no matter how long it was laid. It had to be proof against ice, snow, lightning, sun and time.

My Oshawa Shingles are the result. I worked for years to find a metal that wouldn't rust. I worked on an iceproof lockjoint. I have a shingle to-day that is the best ever put on the market. People buy it from me all around the world, it is so good. These people see how worth-while a good roof is.

I know my Oshawa Metal Shingles so well, and anybody can lay a roof in them so well and easily, that it makes the safest and best roof you can get. But I have a new 100-year metal now. My Oshawa Shingle is Perfected. A 100-year roof is a mighty good article—far better than even old-style, hand-shaved cedar shingles. I know my roof is four times as good—and it won't burn.

Not only that—when you get a roof, get the best you can find. Here is fireproof and lightning-proof protection for you for a century. Yet the roof costs a common, every-day price.

My "Roofing Right" book lets you dig down into my Oshawa Shingle proposition. I want you to send for it. You can get all the facts. Even if you do not use my roof this book is worth money because it gives valuable building hints. My Oshawa Shingles are on the best and most modern buildings. These are pictured in the book. You can get it for a post-card. Send that card to-day. My book will help you in your plans.

Yours truly, G. A. Reed

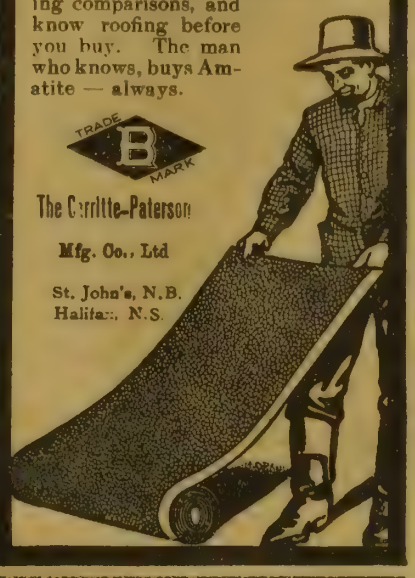
Amatite ROOFING

Mineral Surface Needs No Painting

IF you intend to build, use Amatite. You will do away not only with all roofing troubles, but with all unnecessary roofing expense, because Amatite *needs no painting or attention after it is laid.*

It has a wear-resisting *mineral surface* on top instead of paint. Amatite is easy to lay, fire retardant, attractive and absolutely waterproof.

Send for sample and make roofing comparisons, and know roofing before you buy. The man who knows, buys Amatite — always.



TRADE B MARK

The Carritte-Paterson Mfg. Co., Ltd

St. John's, N.B.
Halifax, N.S.

corn that failed to dry out properly, and the extremely cold weather of the past winter injured much of it, so so that a large percentage of it is unfit for seed purposes.

The Essex Branch of the Department of Agriculture this winter tested large quantities of Seed Corn. Samples were taken from the farmers' wagons at the elevators, from the cribs, or in some cases the Corn was brought to be tested. Of all the samples tested, not over 50 per cent. germinated strong and quick. From samples that were well dried and kept in the house, from 8 per cent. to 95 per cent. germinated.

MAXWELL'S

JEWEL FOOD-CUTTER

is a daily necessity in every home.

You are always cutting up meats and vegetables for stews, etc.

A knife is awkward and dangerous —a chopping bowl is cumbersome.

"MAXWELL'S JEWEL" cuts everything as you wish—fine, medium or coarse because it has five cutting plates.

Easily cleaned—easily worked—very strong, durable and handsomely finished.

Insist on your dealer supplying the "Jewel" because this is the only food cutter made in Canada—and is superior to anything imported.

DAVID MAXWELL & SONS, ST. MARYS, ONT.

133

No Corn Grower can afford to plant corn this spring that has not been tested. Ten or twelve ears will plant an acre. If you plant only two ears that will not grow out of ten or twelve, that means that you are working and cultivating ten acres of Corn, but in reality harvest but eight acres. This loss would pay for testing many times over. With poor seed you often get but half a crop, but by testing every ear before planting and discarding the poor ones you can be absolutely sure of getting a good stand. You should not only plant corn that will grow under favorable conditions but you should plant strong seed so that it will grow if the weather conditions are unfavorable.

With our late spring, it is essential that you plant this season only Seed Corn that will germinate quick and strong.

HOW TO TEST SEED CORN.

It is easy to test Seed Corn, and it takes but little time. Make a shallow box 30 inches long by 20 inches wide by 3 inches deep, inside measurements. Any size box will answer but the above size is very convenient. Fill the box abodt 1½ inches deep with damp sawdust or sand. Over this sawdust place a cotton cloth ruled into spaces 2 x 2 inches. Number the spaces along the top of the box from 1 to 15 and along the left hand edge from 1 to 10. In this way each square can be located readily.

Having selected the Corn to be tested, take each ear, in the butts drive a nail to hold small pieces of cardboard numbered from 1 to 150. Take ear No. 1 and remove two kernels from near the butt, two from the middle, and two from near the tip, from opposite sides in each case. Do not take all the kernels from one place or from one side of the ear. Place six kernels in space No. 1 with the germs upward, and the tips pointing down. After all the spaces have been filled, place a cotton cloth over the kernels very carefully. Then put on another large cloth that laps over the box a foot or more in all directions. Fill up the box with sawdust or sand, fold edges of cloth over top, and dampen with warm water. Place in a warm place and keep moist. In about five days the test will be complete. Lift out the top cloth containing the sawdust and then lift the next cloth off very carefully. Start at No. 1 and throw out all ears that did not grow. Keep only those ears in which every kernel of corn grew, and that germinated strongly. If seed corn is limited, keep those ears in which five kernels out of 6 grew, and in no case plant for seed, corn of poorer germination or that germinated weak.

By testing 150 ears at a time, seed sufficient for 12 to 15 acres may be tested at once, if seed is good. By having more boxes larger amounts may be tested quickly. After testing and throwing out all poor ears, remove the tips and butts of the ears and plant the remainder.

The only way to be sure you have good Seed Corn is to test it. As a rule replanted Corn amounts to very little. You cannot afford to have to replant it, especially this year, as the spring is backward and the season likely to be shortened.

Smut in Oats.

From the calculations received from several hundred inquiries, it is a safe estimate that a large per cent. of the oat crop is annually destroyed by smut. Figure the loss that smut causes on your farm at your average oat yields and average price per bushel. To prevent this loss would cost about $1.00 in formaldehyde and $1.00 in labor for each forty acres. The prevention of this loss is a very simple proposition.

Oat smut is a minute plant that grows in the tissue of the oat plant. The only parts that are visible to the naked eye are the masses of seeds (spores) by which it reproduces. These ripen and are ready for their period of rest just about the time the oat plant is in flower. The chaff is then loose and open and the wind blows these spores over the field, allowing them to lodge on the young berries that are forming. Here they stick fast until the seed is planted and the young oat plant begins to grow. At this time the smut spore starts to develop, sending its filaments into the young oat plant and taking up its nourishment.

The time to kill the smut is while it is in the granary. The simplest method is to use a poison that will not injure the oats, but is fatal to the little spore. Formaldehyde gas is such a poison.

Commercial formaldehyde is a water solution of formaldehyde gas. This solution comes in varying strengths, but the one commonly sold and the one upon which all calculations are based is 40 per cent. Care should be taken that the bottles and cans in which this solution is kept are always corked tight, as the gas escapes very readily and the solution loses strength.

TREATING SEED OATS WITH FORMALDEHYDE.

One pound (pint) of formaldehyde in 40 gallons of water will treat 40 bushels of oats. The equipment needed is a clean floor, a barrel, a sprinkling can, a scoopshovel and plenty of blankets, sacks or tarpaulin. Proceed as follows:

1. Spread out 40 bushels of oats on the floor five or six inches deep.

2. Mix one pound of formaldehyde (40 per cent.) with 40 gallons of water. Stir well.

3. Sprinkle the oats with the mixture in the barrel until they are saturated. It is well at this point for one man to shovel the oats into a pile while another sprinkles. They are not exposed to the air for so long a time and less gas is lost. See that the pile is thoroughly soaked when finished.

4. Cover the pile at once with the blankets and sacks so as to keep the gas in where it will be effective. (It is this free gas that does the work).

5. Leave the pile covered for six to ten hours (over night), then remove the blankets and shovel out thin to dry. Shovel them over from time to time.

These oats may be sown as soon as they are dry enough to run through the drill. Make allowance for the swollen condition of the seed in setting the drill. It is a convenient plan to treat the oats late in the afternoon, then they can be left over night in the pile without danger of heating.

If more oats are treated than are needed for seed, they may be fed after one or two days. All the gas will have escaped.

RAMSAY'S PAINTS

For Practical Painting

RAMSAY'S PAINTS are the best—made by practical men backed by 70 years experience to with-stand the summer's heat and winter's cold — one gallon is guaranteed to cover 360 sq. ft. on wood in fair condition with two coats of paint that won't fade—crack or peel.

RAMSAY'S are the paints you want at the price you want.

Ask your dealer in your town.

A. RAMSAY & SON COMPANY, MONTREAL.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure — you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

MADAM, ARE YOU LIKELY TO BECOME A MOTHER SOON? 16

I have glad tidings for you—childbirth need be dreaded no more. Follow my advice—be happy now, and all will be well with the child and yourself. My remedy,

Mothers' Cordial or Herbal Tonic, builds up the reproductive organs and nerve centres—makes confinement easy, safe and quick, and rapidly recalls the glow and cheering health of vigorous womanhood.

Mothers' Cordial is also a rebuilder of run-down girls—girls strained or overtaxed with too much work. It purifies the blood—makes menstruation prompt and easy, and is accountable for many of the clear, beautiful complexions you admire so much.

This valuable remedy contains no stimulants or hurtful drugs. It is simply a scientific blend of Indian herbs, whose virtues are well known to medical men. Write for free circular. At your druggist's, or by mail, $1.00 per package, or 6 packages $5.00.

DEPT. 103 TWEED, Ont.

An Advertisement in the Maritime Farmer will sell your surplus stock.

Spraying Notes.

(1) "Have a good strong man to work the pump and keep up as high a pressure as possible. The spraying material should come out of the nozzle with a strong singing or humming sound that can be heard for some distance around."

(2) "Lime-sulphur should not be applied when the temperature is below freezing point or while the trees are wet with rain or dew. As much wet weather is generally experienced about spraying time, one cannot always wait for a long dry spell. If, however, you can get the spray applied about ½ of an hour before or after a rain, it will be effective and will not wash off unless followed by long, continued, and heavy rains."

(3) "Unless properly taken care of, spraying apparatus will easily get out of order. Wash the tank out each night with clean water and also pump some of it through the hose, rod and nozzle and either wash in boiling water afterwards drying thoroughly or place in kerosene or some other oil over night."

(4) "If the packing of the pump gets worn, replace with new packing, otherwise the power cannot be kept up."

(5) "Lime-sulphur is strongly caustic and it is necessary to have all connections very tight to prevent leakage. Vaseline and leather gloves are used to protect the hands. The horses and harness may be protected by a blanket or light cover."

(6) "Handle with care all spraying materials as most of them are poisonous. Everything should be kept correctly labelled and under lock and key. Lead arsenate should be mixed in wooden, glass or earthen vessels."

For information regarding the planting and care of orchards, write to: The Provincial Horticulturist, Fredericton, N. B.

SPRAYS TO USE.

1st Spray—Applied during April, before buds begin to open.—Winter strength of Lime-Sulphur:—1 gallon of concentrated Lime-Sulphur, 9 gallons of water.

2nd Spray—Applied just after leaf buds open—1 gallon concentrated Lime-Sulphur, 38 gallons water, 2 lbs. lead arsenate.

3rd Spray—Applied just after blossoms fall—Same formulae as for 2nd.

4th Spray—Applied two weeks after the 3rd—Same formulae as for 2nd.

Note.—The first three sprays are of greatest importance.

Sheep and Pony Raising in Newfoundland.

The petition for the killing of dogs in St. John's East, outside the Municipality of St. John's, is being largely signed in each settlement for the encouragement of sheep-raising; in fact a majority of the people have already signed the petition, as the agents of the society who are taking around the petition reported recently; but they have decided not to be satisfied with a bare majority, but aim to secure the signatures of at least three-fourths of the voters before presenting the petition, and this will be accomplished easily during the present month. Thus sheep raising will receive the boost it needs in St. John's East. In St. John's West the raising of ponies is being encouraged instead for this year. Great credit is due the St. John's Agricultural Society for the able manner in which they are unmistakeably advancing the interests of the farmers of the districts of St. John's East and West.

"METALLIC" Ceilings and Walls

Some of the most imposing residences in our large cities are decorated throughout with METALLIC Libraries, Dining-rooms and Kitchens. It is an artistic yet fire-proof decoration, and will save you money by reducing your insurance rates.

If building a new home METALLIC should be put on without hesitation as you will save the cost of lath, plaster and paper, besides having a cheaper yet fire-proof and vermin-proof interior.

Or you can apply them to old rooms over the plaster. Then they are so easy to keep clean—simply wipe them with a damp cloth now and again and they look as good as when first put on.

When you want to change the color designs simply tint them over with the desired change.

Try METALLIC in your kitchen or bath-room, this is where its qualities are put to the severest test.

METALLIC is very artistic—hundreds of varied designs to select from—heavy beam effects, fancy scroll and panel patterns made to suit every room.

We shall be pleased to quote you if you tell us the size and shape of your ceilings or walls.

Agents Wanted in Some Localities.

BRANCH FACTORY: WINNIPEG AGENTS IN PRINCIPAL CITIES

HARROWS

In these days of expensive labor you can't afford to buy any Harrow but the one which will do your work best and quickest—'twon't pay you.

Our Lever Harrow is a great one; best there is going by long odds. It will harrow steadier, and just to what depth you want it. Then you can regulate the draft on the horses and get the greatest amount of work for the least pulling.

A touch of the levers and the teeth are just where you want them at each round; not too deep at first, to ease the horses, then afterwards when the top soil is loose, throw them down and your getting something done.

Saves time because less scrapes do. Made in sizes 9 and 11 Tooth, Single Section. 15 and 17 Tooth, Double Section.

BAILEY-UNDERWOOD CO., Limited. **New Glasgow, N. S.**

Use of the Land Roller.

(Continued from page 541).

particles. The water is drawn from the subsoil to the topsoil. It may be drawn from a depth of 4 feet, but the increase in moisture is mainly in the first foot of surface soil, though there is a slight increase of moisture to a depth of 18 inches. The total amount of water in the soil is not increased, but simply changes level. In fact, the quantity of water in the soil is apt to be decreased through the greater evaporation at the surface of the rolled ground. Whenever possible, the ground should be covered with a loose earth mulch to prevent this loss by evaporation.

The main precaution to be observed in using the roller is not to roll when the ground is wet. There is also an increased danger of soil erosion, due to the firming and compacting of the surface. To prevent this and also to prevent excessive evaporation from the rolled land, it should be harrowed lightly as soon as possible after rolling.—C. E. Skinner.

The Attractive Lawn.

Here are a few words about lawn making. They are not written exclusively for persons living in cities and towns. They are for farmers, and particularly for the small towns. There is no law against a farmer havinf an attractive front yard. The ground he wastes around his home would cost thousands of dollars in most American cities. Michael F. Ahearn, assistant horticulturist at the Kansas Agricultural College, a lawn maker if ever there was one, says:

"Many lawns in small towns are spoiled by carelessness or ignorance in placing the house. You find one house sitting back 40 feet and another built on the property line. If owners would meet, draw up a plan and agree on something before beginning work, every community would be benefited.

"This applies, also, to planting shrubs and hedges and trees. For all these things are the trimming of the lawn. Too many property owners spend all their money on the house and forget the lawn and the other surroundings. The lawn should be planned before the house is decided upon and before you buy the land you should know something about it. If you are buying a ready-made house, just finished, you should know what is under the recently laid sod. The yard may be filled underneath with lime and stone and plaster and other junk. This is a trick often discovered, and always resulting in disappointment for the man who would like to have a lawn.

"First, you must have rich soil. Any land that will grow corn will grow grass. One foot of soil will grow grass, but two feet is better. Barnyard manure makes the best fertilizer, but I should add, also, plant food. If you have a sandy soil, the plant food will hold it together and keep the moisture. Commercial fertilizers are all right. Nitrate of soda put on before a rain is all right. Bone meal and wood ashes are good but the land may need lime. If you find sorrel growing there, it needs acid. Wet, heavy soil must be underdrained. Plow deeply, disc, harrow and rake it. The soil must be fine. Some of the best lawns around the most costly homes have been made in just this way. Do not imagine that, because your yard is small, it cannot be plowed. This is exactly what it needs, unless you have the time or the disposition to spade it, inch by inch, carefully. Sowing the seed with a drill will give the best results. If you have a large lawn—that is, an acre—and desire to sow broadcast, three or four bushels sown both ways and rolled in will be required. By sowing in drills is meant using the drill attachment to the ordinary wheel hoe.

"Fall sowing is the best. The grass gets a good start before the weeds begin.

"Cut your grass when it is three inches high, and keep it about two inches high. The cuttings should be about two weeks apart and should be continued until September first, anyway. Let the cut grass remain on the lawn. When it becomes a burden, rake it off, but do not do it until you have to.

"Water your land thoroughly. You might as well throw the water over the roof as to sprinkle the grass. This spray brings up the roots seeking moisture and they dry out and die. Soak the ground thoroughly for 30 minutes to an hour.

"Kentucky blue grass leads all mixtures. In some parts of Kansas Bermuda grass will do, but it starts late and frost kills it and bare spots are the result.

"Weeds, the chief offenders, are crab grass, sorrel, dandelions, dock and broad and narrow leaf plantain. I fear the crab grass worse than I fear the dandelions. The only way to get it out is to get the roots. You may cut a dandelion every morning right after you shave and, like your whiskers, it will grow again before night. Sprayers, even, have succeeded only in killing the tops. Nature's weapons are the best, and every man who desires a clean lawn in this respect should spend at least as much time on his knees as he does in church. One dandelion has been known to have 10,000 seeds.

Pure Seed and Clean.

Pure, clean seed is the demand now among the best class of farmers. The time has about passed when the farmer of ordinary intelligence will buy or sow filthy seed of grass or grain. The pure seed proposition has been so thoroughly discussed by experiment stations, farmers' institutes, agricultural journals and writers on farm and crop topics, that there is no excuse for any farmer being ignorant of the injury he is doing his land and himself by sowing filthy, diseased and impure seed.

There cannot be too much agitation however on this subject. Each state should pass such laws in restraint of the sale of impure seed as would force the commercial trade, whether by producer or dealer, to dispose of nothing that would not stand the most exacting test. This is the only way to rid the country of damaging effects that impure and filthy seed is having in opposition to clean crop culture.

Every farmer should protect his own seed and crop interests by providing himself with the necessary machinery and appliances to thoroughly clean

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.
There is not a catch about it anywhere, it's a straight above board business proposition!
It will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

and renovate the seed he uses in all his grain and grass sowings. There is no excuse now for using seed that is not clean, since the market is supplied with mills, graders and cleaners that will put any kind of farm seeds in perfect condition to render the best results in crop growth.

This question of pure seed, of select seed, of the seed with the highest and strongest germinating quality, being most advantageous from a seed point of view, as well as commercial value, is being demonstrated on thousands of farms all over the country. The use of the seed cleaners and the sowing and planting of pure, clean seed, is having its convincing influences upon the observing crop producers.

The old idea that any kind of refuse seed is good enough to sow, that it will reproduce its kind, no matter about its conditions; that the weed seed and filth matters not, as the soil is full of such plant life at any rate ready to start when opportunity offers, etc., is about displaced by the more progressive ideas and practices of planting and sowing the best of everything desired in crop improvement, and having it in the best possible condition of development.

The Motherless Foal.

The time has now arrived for the foals to be putting in their appearance. If through misfortune one loses its mother, the question is what will be the best to do with it? In very many cases they are either destroyed, or they dwindle about or a few days and then die if not properly seen after. If a foal has not sucked from the mare, it is best, if possible, to procure a supply for the first two days from a freshly-calved cow, in order to open its bowels; a young cow is much to be preferred to an old one. Once having started using the milk of a particular cow, no change should be made to any other. To make the milk as near as possible like that of the mare it is necessary to add water and a small amount of sugar. At first give one part of water to two of milk and after a week or two the proportion may be one to three. Later water may be excluded. Add just enough sugar to make it taste a little sweet. The milk should be fed warm as soon as drawn from the cow; cold, stale milk is sure to provoke diarrhoea. If the foal shows signs of constipation, give a small dose of castor oil, and also inject into the rectum some glycerine and water. If the milk of a newly-calved cow can be procured, its purgative properties may be sufficient to open the bowels, in which case laxatives are unnecessary. In other respects, treat and feed the foal the same as if it were being reared on its dam until six or seven months old.

The Fox Terrier.

The fox terrier is a small black-and-white disturbance which afflicts and delights many families. The Fox Terrier has an active, expressive mouth, a lean, well-shaped head, talkative eyes, and a nose which leads him swiftly from one misdemeanour to another. Originally, he had a liberal tail, but it has been revised by man into a mere stump. The Fox Terrier is a house pet, and is clean and dainty in his habits. He lives on meat, milk, potatoes, mice, old shoes, curtains, books, opera hats and tablecloths. In return for his diet he guards the house with unremitting ferocity. No burglar can come near without dislodging an eruption of barks from the faithful brute.

He also guards the house against all cats, dogs, taxi-cabs late pedestrians, bats, owls, dead leaves and moonbeams which may chance to pass the place at night. Losing the Fox Terrier is a favorite diversion of the family which owns him-or at least pays for the dog license. He is as difficult to keep around the house as a husband. The ordinary Fox Terrier has a large acquaintance around the town. Owing to his wandering disposition, the Terrier is loved twice as much as ordinary dogs. He is frantically welcomed when he returns home, and the family is grateful when he goes away again and gives it a rest. Very few people have seen a Fox Terrier die because he always loses himself first. —Sporting Times.

Tidying Up the Farm.

At the end of the winter season, when the buildings and yards are once more emptied of the cattle and horses, it is not unusual on most farms for the bulk of the farm staff to be set to work to clean the sheds of the dust, cobwebs, and dirt which has accumulated during the lengthy occupation of the stock, and to throw the manure in the yards into shapely heaps, so as to make the premises at least approachable for those who may have business there. If it can be managed the lime-wash brush should be freely used at such times, for it sweetens the place, not only for next summer, but for next winter as well. Yards should also come under review while the tidying up fit is on. There ought not to be much litter lying about. Next, gate-ways and fences are often calling for attention at the beginning of the grass season. If there be a defective place in a hedgerow likely to be forced an inquiring beasts or horse, the better plan is to protect it with a rail at once, and thus remove the temptation. Or if a gate needs new posts, fix them while time can be spared, and do not postpone the evil day until the posts suddenly snap and leave a promising field of grain or mowing grass open to the inroads of [illegible]. Lastly, when these outdoor repairs are made good, do not forget to remove the worn-out rails or gate-posts. Unless this be done there can be no tidying-up in reality.

Preserving Fence-Posts.

After an exhaustive series of experiments, a Wyoming farmer says that "the best treatment, and one which was eminently successful in preserving the posts, was dipping the lower ends in crude petroleum and burning off the oil a sufficent distance to come above the ground when set. This seems to drive hot oil into the post, which, with the protecting char cover, keeps it from decay.

Here's Your Paint!

Whatever your job of painting—whether you do it yourself, or have a painter do it—be sure of a GOOD job, soonest done, best looking, longest service, by getting

M-L MAPLE LEAF PURE PAINTS

All ready for use. Simply choose the right color from the forty-seven shades in which M-L paints are made—take off the cover, stir a bit and start to work. You'll find M-L Pure Paints spread easier, cover more surface, give a smoother, glossier finish than any other paint you could buy.

Use M-L Paint and You Won't Have to Paint so Often

Other paints soon fade, blister and flake off because other makers haven't yet found out, as we have, how to mix a special ingredient with other pure materials to make an elastic, durable paint that stands extremes of wear and weather, and keeps its lustre for the longest time.

Decorate the walls and ceiling with M-L FLAT WALL COLORS. More economical, more artistic, more sanitary than wall-paper. Easily applied and very durable. Washable, too. 16 shades. Try them.

Changes in the Number of Cattle, Sheep and Swine During the Last Ten Years in the Countries Adhering to the International Agricultural Institute.

The continual rise in the price of meat has long formed the object of discussion in a large number of countries. The unusual cost of this, as well as of other important commodities, has been evident for many years past, and has given rise to various investigations as to the causes.

The question is certainly a complicated one and we do not pretend to offer a solution of it here, but merely present a few points for study.

The first point to be taken into consideration is whether, during the last ten years, the total number of live stock has increased or decreased, and by how many. It should then be ascertained whether the number of live stock has increased or decreased in proportion to the population. The total number of live stock may have increased, but perhaps not to such an extent as to keep pace with the increase in the population; or, on the other hand, in some countries the rate of increrse in live stock may be greater than the rate of increase in the population, which without considering other influences, would result in the exportation of the surplus of such countries to countries in which home production did not suffice to meet demands.

Such figures are presented in the following tables. Data are given only for cattle, sheep and pigs, these animals supplying the great majority of meat used for human consumption.

As will be seen from the tables, the period between the two dates of the returns of live stock varies, in the majority of countries, between 8 and 10 years. Two important exceptions are in the cases of Spain and Italy; the period for the former being 18 and for the latter 27 years.

CATTLE.

In the group of countries considered, the total number has increased. The number per 1,000 inhabitants has also increased, the population having increased by 13·1 per cent. and the cattle by17·6 per cent.

It is interesting to note that, although the total number of cattle in Europe has increased, the number per thousand has decreased; for while the population has increased by 13·2 per cent., the number of cattle has only increased by 4-4 per cent. In America and in Australasia the proportion increase in cattle has been greater than that of the population. In Canada there has been an increase during the years 1900-10 of 138 cattle per 1,000 inhabitants.

SHEEP.

In the group of countries considered, the total number has increased, but the but the number per 1000 inhabitants has decreased, the population having increased by 13·5 per cent. and the number of sheep by 8·5 per cent. It should be noted that in Europe not only has the number of sheep per 1,000 inhabitants decreased but also the total number. There has been a decrease of 27 sheep per 1,000 inhabitants in Canada during the years 1900-10.

SWINE.

In the group of countries considered, the total number has increased. The number per 1.000 inhabitants has also increased, the population having increased by 14·0 per cent and the number of swine by 19.8 per ceut.

It is interesting to note that though the total number of swine in Europe has increased the number per 1,000 inhabitants has slightly decreasd, the population having increased by13.2 per cent while the number of swine has increased only by 12·9 per cent.

In America the proportionale increase in the number of swine is greater than that of the population, and in Australasia less.

When examining these tables it should be borne in mind that the breed of the animals is almost everywhere continually improving, so that a given number of live stock to-day represents, in all probability, a larger quantity of meat than the same number of animals ten years ago. Swine have increased in Canada during the years 1900-10 at the rate of 35 per 1000 inhabitants.

A Good Thing to Have.

Why is it that some farmers seem to find more hours in a day than others? They do not start earlier to work in the morning, nor do they finish later at night; but they get more done in their ten or twelve hours than the rest of us do in a longer day. Every minute seems to count for something with these farmers.

It is just a case of system in work. System has been defined as the "essential factor of successful business," the "keynote of modern industry," and so forth; but to bring it down to a fine thing it is just a case of using one's head to save one's feet.

There is no business that calls for a greater attention to details than farming. The number of small things that we farmers have to think of if we are to make a success of our business is tremendous. We have greater need of system in our work than have most business men. Too many of us are trying to run large farms without a semblance of systematic management.

We are acquainted with an old farmer who runs a large farm by hired labor, has several branches of live stock to look after, and everything goes like clock work. In explaining his success to us this farmer attributed it to his knowing every day and generally two or three days in advance just what work was going to be done on a certain date and on just what hour of every day the small "chores" were to be done. Systematic management of this kind can be made to save many hours of labor and enables us to do much more work in a given time. We farmers of all men need system in our business. It will cost us nothing but a little mental effort to make our management systematic.—Farm and Dairy.

Letter Heads Good Advertising.

Printed letterheads and envelopes are good advertisers. When a letter comes, it makes a big difference if it has a printed letterhead and envelope. It looks like business, and it is business of the best kind.

We farmers need such printed letterheads. There should be something for sale on every farm, and the letterhead can be made to advertise it very cheaply. It will also be found that the printed letterheads will have quite an influence on the person himself. The more he sees it the more pride will be taken in keeping up the quality of the articles for sale.

It is not accident that business men in all lines use the printed letterhead. They have found that it is a good business proposition. Those farmers who have tried it have found it both profitable and a source of pride. The cost will not be so much more than for plain paper. It may seem a little large, but then one wants to remember that he is getting a good many sheets and envelopes at one time.

Big Ben

Don't set your mind—set Big Ben

Don't bother *your* head about getting up. Leave it to Big Ben.

You ought to go to sleep at night with a *clear brain*—untroubled and free from getting up worries. You men, if you are up to date farmers, work with your brains as well as with your hands. Such a little thing as "deciding to get up at a certain time in the morning" and *keeping* it on *your mind* often spoils a needed night's rest and makes a bad "next day." Try Big Ben on your dresser for one week. He makes getting up so *easy* that the whole day is better.

Big Ben is not the usual alarm. He's a timekeeper; a good, all-purpose clock for *every day* and *all day* use and for years of service.

He stands seven inches tall. He wears a coat of triple-nickel plated steel. He rings with one long loud ring for 5 minutes *straight*, or for 10 minutes at *intervals* of 20 seconds unless you shut him off.

His big, bold figures and hands are *easy to read* in the dim morning light, his large strong keys are *easy to wind*. His price, $3.00, is *easy to pay* because his advantages are so *easy to see*. See them at your dealer.

5,000 Canadian dealers have already adopted him. If you cannot find him at your dealer's, a money order sent to *Westclox, La Salle, Illinois*, will bring him to you duty charges prepaid.

$3.00

At Canadian Dealers.

Spring cleaning is a very necessary part of poultry raising. The chicken yard should be thoroughly cleaned, all trash burned, the houses disinfected and the runs renovated. This will destroy disease germs and remove breeding places of insect pests, such as lice and mites. By thoroughly cleaning up the premises you may save the lives of many little chicks.

GARDEN SEEDER

Our Seeder has years of success behind it and the improvements recently added, makes it without doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. The flow of seed can be instantly stopped by a swinging cut-off operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our Garden Seeders greatly increased. No better seeder can be built for accurate and fast sowing of turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seed.

Every machine carries our absolute guarantee.

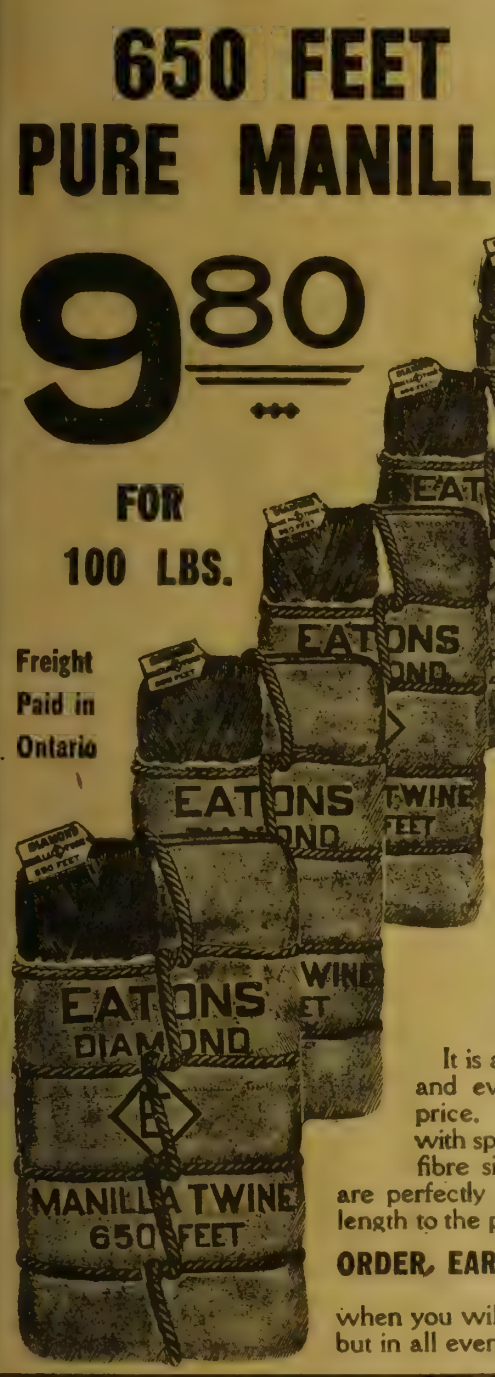
BINDER TWINE

650 FEET PURE MANILLA

9.80

FOR 100 LBS.

Freight Paid in Ontario



NOTE OUR LOW PRICES ON

GUARANTEED BINDER TWINE

TELL your neighbors about our wonderfully low prices for Binder Twine this season. We will esteem the courtesy greatly if you will tell your friends who use binder twine, and tell them we will be glad to supply them with binder twine at the prices quoted in our Spring and Summer Catalogue.

WHAT WE SAY OF THIS TWINE

It is as good binder twine as is made, strong as any made, smooth and even as any made. We say this regardless of make, brand or price. Our 550 feet Diamond ◈ Brand Binder Twine is prepared with special care from the choicest manilla hemp and first quality long fibre sisal. Our Diamond ◈ 650 feet is made from pure manilla. Both are perfectly free from lumps, snarls, thin or uneven spots, and will measure full length to the pound. It is unusually strong, therefore every inch of it can be used.

ORDER EARLY Send in your order promptly—to-day if possible. If you do not want us to ship the twine at once, say so in your order. State when you will want it, and we will ship it so it will reach you on the day specified; but in all events we would suggest that you order before July 1st.

Fighting Cutworms.

Tomatoes, cabbage, sweet potatoes and other vegetables and garden plants, and especially those which are started under glass and transplanted, are subject to serious injury by cutworms. They appear sometimes in great numbers in spring and early summer and frequently do severe injury before their ravages are noticed. The method of attack is to cut off the young plants at about the surface of the ground, and as these insects are of large size and voracious feeders they are capable of destroying many plants in a single night, frequently more than they could devour.

The usual method of control is by the use of poisoned baits. Take a bushel of dry bran, add 1 pound of arsenic or Paris green, and mix it thoroughly into a mash with 8 gallons of water, in which has been stirred half a gallon of sorghum, or other cheap molasses. After the mash has stood several hours, scatter it in lumps about the size of a marble over the fields where injury is beginning to appear and about the bases of the plants set out. Apply late in the day so as to place the poison about the plants over night, which is the time when cutworms are active. Apply a second time if necessary.

When cutworms occur in unusual abundance, which happens locally and sometimes generally in some seasons they exhaust their food supply and are driven to migrate to other fields. This they do, literally in armies, assuming what is called the army-worm habit. At such times it is necessary to treat them as we do army worms. While the methods which have been advised are valuable in such cases, these remedies may be too slow to destroy all the cutworms and we have to employ other methods. These include trenching, ditching, the plowing of deep furrows in advance or the travelling cutworms to trap them, and the dragging of logs or brush through the furrows. If the trenches can be filled with water, the addition of a small quantity of kerosene so as to form a thin scum on the surface will prove fatal. In extreme cases barriers of fence boards are erected and the tops smeared with tar or other sticky substances to stop the cutworms as they attempt to crawl over,

Clean cultural methods and rotation of crops are advisable as also fall plowing and disking.

You rarely ever hear of a horse getting cut on a well-stretched wire fence : it's that slack wire or a loose piece that so often ruins, and frequently kills, some of our finest specimens of animals on the farm. When one staple and a moment's time would have prevented this loss.

Is the Dairy Shorthorn Possible ?

(Continued from page 539)

it is surely a queer commentary on affairs in the stocker world of to-day. Everyone will agree with Mr. Campbell, who has travelled in Institute work quite extensively, that the condition of the live stock on the farms of the general farmer is most deplorable. It is this that has led to the present agitation. And our conclusions as to its cause will rarely agree with Mr. Campbell's when the situation is cleared. It is not the intention of those who would like to see the good old cows of a former day upon the same farms—to relegate Shorthorns to the dairy breeds. that is not the point at all.

GOVERNMENTS HAVE DONE LITTLE

It is a most deplorable thing that there is no bulletin nor study of the possibilities of this general purpose cow to be had in Canada. Go to the O. A. C., to Hon. James Duff, or to any other department of Agriculture in Canada, and the same confession must come as is seen in the following letter from Prof. G. E. Day, of Guelph: "I regret that I do not know of any special bulletins dealing with this subject. There have been numerous articles in the agricultural press from time to time in connection with the subject."

When we consider that the special dairy breeds have been bonused to such an extent in Canada; when we see their amazing progress; when we note the foregoing fact about this grand old breed, it seems about time that somebody had a vision and a courage big enough to do something for the average farmer. The indifferent farmer we will always have with us. The man who does not want to handle a special dairy cow, the mixed farmer—and he is legion all over the splendid country—is the man who ought to receive some attention. In this regard, these words—"the nearer we can come to a combination of the two (dairy and beef) for the ordinary farmer, the better. I know of no animal for that purpose better than the Shorthorn"—spoken by one of the Miller boys, of Brougham, whose family traditions are redolent of good cows, appears to hit the mark on the bull's eye.

Alvin Sanders, of The Breeders' Gazette, says in his book:—

"The average farmer, as distinguished from the dairyman and professional feeder, maintaining cattle as an incidental, albeit necessary, feature of a well-ordered system of mixed husbandry, requires not only milk, cream and butter in good supply for domestic consumption, but the cows that provide him with those products are also expected to raise a calf each year that can be profitably utilized in consuming the grass and 'roughness of the farm.'"

SOME DANGERS TOO.

There are dangers, however, in going after the questton without true ideals of what is required. As has been remarked, it would be a calamity to make "dairy form" a feature of our Shorthorn breeding. A record of performance would be all right if the animals came up to a certain standard.

Plenty of people would buy a bull without seeing it or his ancestors, provided his dam were a heavy milker. This would lower the individuality of the dual-purpose here. Against such a tendency we would need education.

It is this fact, I have no doubt, that will prove to be the undoing of many a Holstein and Ayrshire herd where signs are already not wanting that constitutions are weak.

The judging at the Chicago International of dairy Shorthorns gives 50 per cent. for beef and 50 per cent. for dairy points, and it is essential that that basis shall still obtain. That the board did not yield to the demands of some enthusiasts to increase the diary points is much to their credit.

A SUMMARY.

Let us sum up the question.

1. There is a big shortage of good beef cattle in the country.
2. Our supply of stockers henceforth must come from the small farm. The ranches are done.
3. A preponderating number of small farmers need a general purpose cow.
4. The present spread of dairy breeds has induced the small farmer to use these dairy sires.
5. This cross-breeding has done a big harm to our beef trade, and has not bettered, yea, has deteriorated the milk yields of the average cow on the farm.
6. The old big-bodied Shorthorn cow filled the bill exactly.
7. These cows are still possible, as our evidence here produced has proven.

THE DIFFICULTIES IN THE WAY.

The chief difficulty in the way of getting these cows on the farm is their scarcity. It is extremely difficult to find them in any part of Canada. They have them in England. Many are practically purebred, but can not come into the Dominion herd book. There is no way in the cattle world to produce a purebred by crossing-up, as in the Clydesdale association. So far as the Shorthorn herd book goes, it is a close corporation.

The beefing qualities have been paramount so long that many a cow today has all she can do to give enough milk to raise her calf. Thomas Bates' arraignment of Mason of Chilton might be equally as effective against many of our Canadian breeders of today. The demands of the ranch have been responsible for the situation, and that same demand has now proven the breeders' undoing. Our stockers, as John Campbell remarks, are a sorry bunch.

Secondly, we have no herd book appendix or official record for this valuable part of Shorthorn breeding. This, though, can readily be overcome, as it is being done in the United States.

There is a splendid opportunity for young men in every province of Canada to do their fellow-countrymen a splendid service by launching into the production and recording of this dual-purpose cow. The Breeders' Gazette, of Chicago, said in their report of the last International: "It is obvious that the milking Shorthorn must henceforth be reckoned with as an established type, with men of brains and purpose behind it, with the successful work of the British breeders as a guiding background for its advocates, and with a wide field of economic usefulness before it."

FREE THIS MAGNIFICENT DOLL'S HOUSE AND HANDSOME IMPORTED DOLL

also TWO complete sets of beautiful furniture for the house and this lovely gold-finished jewelled ring

GIRLS, THIS IS A CHANCE OF A LIFETIME. DON'T MISS IT. This magnificent doll house is a perfect little palace. EXACTLY LIKE THE DRAWING IN EVERY DETAIL, with its quaint gothic roof with two chimneys, fine porch, lovely verandah and broad handsome front steps. The outside of the house is finished in red brick, the inside is beautifully papered throughout, and every window has curtains. IT IS FURNISHED COMPLETE with the loviest furniture you have ever seen—two complete sets, including sofas, chairs, tables, beds, bureaus, wash-stands, etc.

THE HANDSOME DOLL WE GIVE YOU WITH THE HOUSE is a little beauty Fully jointed so that she can sit down, turn her head, move her arms and legs, and she is dressed with fine underwear, shoes, stockings, etc., complete from hat to shoes.

Girls, if you want to secure ABSOLUTELY FREE this handsome doll house, lovely doll, the two sets of furniture and the beautiful jewelled ring, send us your name and address at once and agree to sell only 25 of our delicious perfumes at only 10c. each They come in six lovely odors, rose, carnation, lily of the valley, violet, lilac and heliotrope, and with each package we send a beautiful piece of gold plated jewellery to give free to your customers. This makes them sell like hot cakes. When sold, return us the money, only $2.50, and we will promptly send you all 5 hand some presents carefully packed, exactly as represented We arrange to stand payment of all charges right to your door with free goods covering same. DON'T DELAY, write us to day, and in a few days you can have the magnificent house and all the beautiful presents. Address— NATIONAL SALES CO., Ltd. Dept. H 284 TORONTO, ONT.

Have you talked with your neighbors about subscribing for THE MARITIME FARMER? Why not do it now? Make up as large a club of subsbribers as you can and send them in.

BUY A WAGON

YOU CAN DEPEND ON

For convenience, strength and durability, get a T-A Handy Farm Wagon. Designed especially for farm work, will give everlasting service under the roughest usage to which a wagon can be put. And besides—it is easy on horses.

T-A Handy Farm Wagons and Wide-Tire Steel Wheels

Carefully and strongly built of the highest grade material, these T-A Wide-Tire Steel Wheels will carry 25 to 50 per cent. heavier loads without the least danger of breaking down or getting stuck.

We will be pleased to send you descriptive catalogue. Write for it.

Tent Caterpillars.

The very large number of eggs of Tent caterpillars which have been present on apple, wild cherry and other trees during the past winter are now hatching and the young caterpillars will soon make their conspicuous webs on the branches and twigs of trees.

During the spring and early summer of 1910 these caterpillars were extremely abundant in eastern Canada and were responsible for widespread and serious defoliation of fruit and shade trees. In all probability they will be even more numerous and destructive during this year. These caterpillars are very easily controlled in orchards, ornamental grounds, along roadsides and on shade trees of town and city, if the webs in which the caterpillars sheltered at certain periods of the day are removed. This can readily be accomplished by either burning the webs by means of a torch, or by cutting off and destroying the small branch bearing the web or nest. The best time for destroying the webs is during the early or latest hours of the day; in the middle of the day; the caterpillars are generally out of the webs feeding.

If these webs are not removed while the caterpillars are small many trees will of course be entirely defoliated and in consequence seriously injured. When the caterpillars are seen to have spread over the trees, they must be killed by spraying the foliage with a Paris green mixture (using one pound of Paris green, one pound of unslaked lime and 160 gallons of water) or arsenic of lead, three pounds in 40 gallons of water.

Orchardists and all citizens interested in the protection of our fruit and shade trees, should destroy as many of these webs as possible during the month of May.

Wild Oats and False Wild Oats.

According to a bulletin recently issued by the Seed Branch of the Department of Agriculture at Ottawa, there is a type of more or less harmless Wild Oat that is frequently confused with the true Wild Oat which is recognized as being one of the worst of weeds. This publication, prepared by Mr. Norman Criddle, describes field experiments with these two plants and explains by means of charts and descriptive matter their distinguishing characteristics. According to this authority, it is a comparatively simple matter to distinguish the two sorts in the growing stage as the false variety shows the same manner of growth as the cultivated oat while the true Wild Oat exhibits a different habit. In the seed form, the difficulty of telling them apart is greater, more especially in so far as some of the smaller varieties of the False Wild Oat are concerned. With the larger sorts, the difficulty of distinguishing them is more easy as an experienced eye will at once detect the False Wild Oat by its larger size and its usual close resemblance to the cultivated variety in which it is found. Generally speaking too, the outer seed coat is more open in front with cultivated forms and False Wild Oats so that the inner coat is broadly visible, whereas in Wild Oats, the edges of the outer coat almost meet. Readers interested in distinguishing Wild Oats from False Wild Oats would do well to write to the Publications Branch, Dept. of Agriculture, Ottawa, for a copy of Bulletin No. S. 7.

A Poultry Instructor for British Columbia.

Mr. J. R. Terry, formerly assistant poultryman at the O. A. C. Guelph, Ontario, and since January 1st, 1911, Provincial Poultry Instructor for British Columbia, has been appointed Chief Poultry Instructor for that Province. The vacancy caused by Mr. Terry's promotion has been filled by Mr. H. E. Upton, who for the past two and a half years has been Poultry Instructor under Professor W. A. Brown, at the University of Maine, Orono, Me. Mr. Upton is an ex-student of the O. A. C. Guelph, Ontario, Canada.

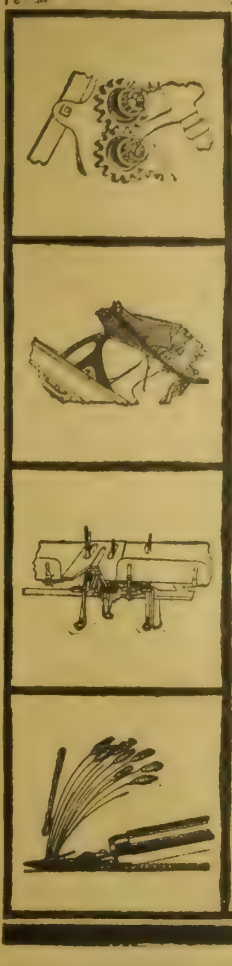
Prevention of Rooting.

The pig that goes rooting is a nuisance on every farm. Some breeds are worse in this way than others, and require to be restrained by the very practical method of ringing. As a rule, the long-snouted breeds are the worst sinners in this respect, and many an orchard can tell a tale of wasted hours in the rooting up of old pasture by grazing pigs.

The means by which the prevention of rooting may be accomplished is a very simple one. Single rings are sometimes effective, but invariably they fall out either through wearing away or tearing part of the cartilage of the nose. Two or three rings are therefore used in the case of bad rooters.—'Farmer and Stockbreeder.'

Motherless Lambs.

Now is the time that the motherless or "one too many" lambs are being brought to the house to be fed with milk. There is usually a hunt for a teat of some sort, and old glove fingers, etc., are often pressed into service. We have found the easiest way to give the food is to pour it into a basin and let the lamb suck it up with the help of a finger as a calf does. It does away with all danger of sour and dirty teats, and a lamb of three hours old seems quite able to manage. If the milk causes scour—it usually does—the best thing seems to be to dilute it with water and give a mixture of milk and buttermilk as soon as possible, gradually increasing the proportion of the latter; a little dry slops of good quality is a great help, too. Theoretically, weakening the milk is wrong, but practically, it seems effective, and a teaspoonful of gin or other spirit has a soothing influence if griping pains are troubling the little orphan.



Tall Grain and Short--Both Look Alike to a Deering New Ideal Binder

TO harvest successfully short or tall grain that is filled with undergrowth, to cut and bind it all without waste—these are the problems that confront the farmers of Eastern Canada.

Deering binder features solve these problems. The T-shaped cutter bar, which is almost level with the bottom of the platform allows the machine to be tilted to cut close to the ground without pushing trash ahead of the knife. This, together with the reel adjustments for very tall or very short grain, makes the Deering binder very successful in Eastern Canadian harvest fields.

The elevator projects ahead of the knife and is open at the rear to enable it to deliver the grain properly to the binding attachment. A third packer reaches up close to the top of the elevator and delivers the grain to the other two packers. A third discharge arm keeps the bound sheaves free from unbound grain. The Deering knotter never fails.

See the Deering local agent and have him explain fully all the strong features of Deering harvesting and haying machines and tools and binder twine. Get catalogues from him or write the nearest branch house.

Sheep Dipping.

The method followed in dipping sheep at the Connecticut agricultural College is to use an inexpensive, galvanized steel dipping tank set into the ground so the sides are about the right hight to reach over conveniently. This is located at a convenient point and a dripping board is arranged for the draining of the sheep after the dippings, so no more solution be wasted than necessary. One man catches the sheep and passes it along when another takes it and places it in the tank where it is immersed and passed on to the draining board.

After standing a few moments to drain, sheep are turned loose, but not allowed to go where grass is growing as the drip might cause trouble, if they were allowed to graze where it has covered the grass. The commercial dip of two gallons to 112 gallons water makes a quantity sufficent for a small flock. A permanent pant is a good thing where many sheep are kept, and where this is arranged the sheep should stay for a few moments in a pen with a cement floor, so arranged that the drip will drain back into the tank. The college practices dipping right after shearing and repeats in about two months.

Drain Tile of Cement.

Near South Bend, Ind., are miles of cement tiles laid as far back as 1875 Both sewer pipes and drain tiles were made. Recent investigations made by a large manufacturer of cement indicate that in every instance where these cement tiles and pipes were properly made and properly laid they have performed their functions perfectly and are today in nearly perfect condition. The water seems not to have perceptibly worn away the concrete.

The secret of making good durable concrete tiles seems to be, first to use good materials, both of cement and coarser stuff ; next, to use enough cement to thoroughly fill the voids, and then to use the material in a fairly moist condition, to compress well and to keep the tiles moist untill they are well cured.

Where there is no excess of alkalies in the soil there seems reason to expect cement tiles to endure for many years without deterioration.

Dry Potatoes as Stock Food.

Within the last ten years the drying of potatoes for stock food has, says Prof. Price writing in the American Agriculturist, come to be an important industry in Germany. Dried potatoes as food stock are regularly found open the markets. The drying is done in special factories equipped with drying machinery. In 1907 there were only 118 factories, and last year 404. There are two forms in which potatoes are dried: "Schnitzel," similar to dried beet pulp, and "fiocken" or flakes. In preparing schnitzel raw potatoes are first shredded into pieces about the size of a small lead pencil and then dried. Potatoes are first cooked by steaming and then passed between hot rollers in making flocken. While the dried potatoes are used for all kinds of live stock they are fed mostly to hogs. Potato flocken is excellent for fattening purposes. Corn in the ration can be replaced by flocken.

A pitchfork, carelessly thrown around, is a wicked-looking instrumeut, through which many a farmer has had cause for regret— after it had crippled, killed or ruined some valuable animal or severely wounded some member of the family, endangering their very lives.

The Value of Dynamite.

One mistake that the farmers in the older sections of the country are making is failure to use the plant food in the lower soil. Where the land is plowed year after year to about the same depth there is a tendency to form a sort of floor or crust about the level of the bottom of the furrow. Through this crust the plant roots pass with great difficulty. Some of the finer roots never get through and as a result a very flat root system follows instead of one reaching down to lower levels of moisture and nutrition. This is the secret of the success with such plants as sweet clover, alfalfa and other clovers. The long system of roots passes down to levels that are not reached by the smaller grains and corn. Naturally the plants enjoy a longer life and make a more vigorous and hearty growth. It is not possible to change the root system of a plant but it is possible to make available the food that nourishes these roots by deeper plowing or by breaking up the sub-soil with explosives. Herein is where dynamite is most valuable to the general farmer.

Turkeys.

The weather has such an important bearing upon the successful rearing of young turkeys that an endeavor should be made to have them hatch at the proper time. For the southern half of old Ontario I should say the last week in May is as early as they should be hatched, and in the northern part, the first week in June. Last year early May poults struck ideal weather for the first time in my experience, but the previous year was just the reverse, many losing a great proportion of those hatched in May on account of the wet, cold weather. I feel sure the dates I have mentioned are close to the best time in the average of years.

I prefer the turkey hen for hatching purposes, but chicken hens and incubator will give fairly satisfactory results. Large chicken hens of the Asiatic type will cover nine turkey eggs. Medium hens of American type, seven eggs, and a turkey hen, in May, seventeen eggs. New laid turkey eggs frequently hatch upon the 27th day, but on the average it takes twenty-eight days. I am informed that the incubator should be run about one degree lower for turkey eggs than when hen eggs are used, that is, 102, and not over 103 deg. In preparing the nest for hatching have sufficient room for the broody hen to turn easily upon the eggs, and do not allow them to jump down upon the eggs when going on the nest. Use soft hay, fine oat straw or wheat straw and chaff mixed for nesting material but be sure there are no "thistles" or "awns" in this material to irritate the hen while sitting. Having got thus far it is important to remember that in every case the nest should receive a liberal dusting of insect powder. Make sure the broody hen has settled down for business before trusting her with the eggs—let her stay on for a couple of days. I allow the hen to come off the nest when she pleases during the day, and provide for her only a drink of clean, cold water, and dust bath. Grass is plentiful at this time, and this is all they seem to require in the way of food. When the hen is noticed off the nest the latter should be examined and if any eggs are broken or 'smeared" all should be "cleaned up" before the hen returns. It is also advisable to close up the nest at night if at all possible, in order to keep out dogs, skunks, etc. as early in spring as the ground will permit a bed of onions (shallots or potato variety) should be planted, and another again in two or three weeks. These are needed to furnish the green tops for the young poults in June. I make each of those beds about four by eight feet.

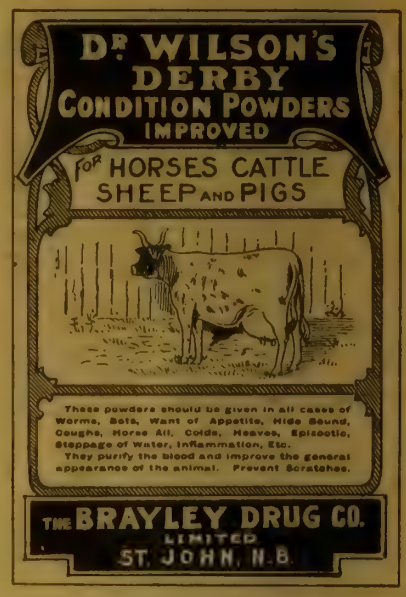
Canada's Leading Stock Men Strongly Recommend the use of

Dr. WILSON'S DERBY CONDITION POWDERS

for Horses, Cattle, Sheep and Pigs

The names of the successful Stock Breeders whose testimonials appear in this advertisement, are household words in the Maritime Provinces. They are some of the leaders who are setting the ideal to which progressive fellow farmers aspire. They are authorities on the care and management of Live stock.

Read what they say about Dr. Wilson's Derby Condition Powders, the best Live stock conditioner on the market as it purifies the blood and improues the general appearance of every animal to which it is administered.



DR WILSON'S
DERBY
CONDITION POWDERS
IMPROVED
FOR HORSES CATTLE
SHEEP AND PIGS
These powders should be given in all cases of Worms, Bots, Want of Appetite, Hide Bound, Coughs, Horse Ail, Colds, Heaves, Epizootic, Stoppage of Water, Inflammation, Etc.
They purify the blood and improve the general appearance of the animal. Prevent Scratches.

Gentlemen: It affords us great pleasure to let you know of the great success we have attained by the use of your Condition Powders. We have been feeding them for some time back and are satisfied that they are as good as you claim them to be and in our estimation there is no better in these parts.
Wishing you continued success, we are,
Yours truly, LOGAN BROS.
Breeders Holstein Cattle and Clydesdale Horses.

Truro, N. S., Jan. 12, 1910.
The Brayley Drug Co., Ltd.
St. John. N. B.
Gentlemen: It affords us great pleasure to recommend Dr. Wilson's Derby Condition Powders to anyone looking for genuine Powders. We think they are a very good medium for fattening cattle and improving their appearance. We would not be without them as their cost is not to be considered with the vast amount of good they do. Yours truly,
RETSON BROS.

Buctouch, N. B., June, 10. 1909.
The Brayley Drug Co., Ltd.
St. John, N. B.
Gentlemen: I believe I have been using Dr. Wilson's Derby Condition Powders since they were first introduced in New Brunswick. I am well satisfied that they have done my cattle a power of good. I have used no other in four years despite many inducements offered. Yours truly,
J. D. IRVING, Seaview Farm.
Breeder Holstein Cattle and Clydesdale Horses.

Truro, N. S., April 19, 1910.
The Brayley Drug Co., Ltd.
St. John, N. B.
Dear Sirr: I will be needing some more of your Condition Powders very soon. When will your agent be in Trupo?
I might take this means of congratulating you on your manufacturing such an excellent powder. I have recommended Dr. Wilson's to many of my friends who breed cattle as I feel sure they will be as well satisfied as I am. Yours very truly,
C. A. ARCHIBALD.

Silver Falls, St. John Co., N. B., Sept. 10, 1909.
The Brayley Drug Co., Ltd.
St. John, N B.
Dear Sirs: Dr. Wilson's Derby Condition Powders were recommended to us and we decided to give them a trial. We feel sure they have proved their worth to us in many ways. We feed them regularly and we feel safe in proclaiming them the best Condition Powders we have ever used. Yours truly,
JOSELYN & YOUNG.

Burnside Farm, Howick, P. Q., March 21, 1910.
The Brayley Drug Co., Ltd.
P. O. Box, 301, St. John, N. B.
Gentlemen:—You will no doubt be pleased to hear what I have to say. I want to say a word in favor of your Dr. Wilson's Condition Powders. They were recommended to me at a Dominion Exhibition in Halifax, N. S., and I decided to try them. I have used many Condition Powders before but never with such remarked success as with yours.
I think I have as nice a stock of Ayrshire cattle as can be found anywhere and can give your Dr. Wilson's Condition Powders a share of the credit.
Ever wishing you success, believe me,
Dear Sirs, Yours very truly,
R. R. NESS.

Dr. Wilson's Derby Condition Powders may be purchased in every town in the Maritime Provinces and is manufactured by

BRAYLEY DRUG COMPANY, LIMITED, St. John, N. B.

The Dairy Cow at Time of Parturition.

The care begins long before the time for partuition to be due. Not anly is the cow that is nourishing a quickly-growing foetus to be well fed but extreme watchfulness against injury from attacks of the "boss" cow of the herd, or from any of the many ways in which injury may be received, is absolutely necessary, that the labor of parturition may not be increased or the life of the cow endangered.

"Drying-up" the cow is important. many of the troubles with the udder come from improper drying. Care must be exercised that no old milk is left in the udder. Some have ascribed to this the cause of milk fever, but whether this be true or not, certain it is that garget and other udder ills may easily result from improperly cleaning out the udder in drying.

During the "dry" period, the cow, if in the stable, must be kept in healthy condition. Our experience is that judicious feeding of such foods as ensilage and chaff, clover hay, chop, and "salt at will," keeping the bowels in good condition, and lessening the quantity of feed for a week before calving, will give better and safer results than dosing with mixtures which the cow does not get in ngtural feeding. No dairyman can profitably do without bran and some succulent food for nourishment and healthy maintenance of the cow at approaching parturition. Every natural means which adapts the system of the cow to the work she must perform at this stage should be imitated under artificial conditions of feeding, and the care with which this imitation is exercised increases in direct relation to the increased return expected from high breeding and other artificial conditions with which we surround our cows. We must know our individual cows preparatory to and at parturition, as well as during lactation.

Difficulties in parturition occasionally present themselves. A little experience will lead us to know whether presentation is right for safe delivery or not. If all is right, in some few cases some assistance may be necessary, and be rendered with no harm to the cow, and will shorten the period of labor. If, on the other hand, examination shows wrong presentation or malformation, unless sure of our ability to accomplish a successful delivery, we leave the task to the veterinary surgeon.

Safe delivery accomplished, what next? The cow has thrown back on her system a large quantity of blood and nerve force which have been going to the foetus. The whole system is in a state of tension, and often complications result. Our experience has cost us something, for we have tried apoplexy and other inflammatory ills have resulted, and often disastrously. Time gone by we have removed the calf before it was dry, then milked and fed the cow, and watched for the development of parturient apoplexy. Now we leave cow and calf together in a box stall, clean and well bedded. The mother has her offspring with her and the satisfaction of this condition is a partial relief for the tension. We do not milk immediately, except to test the udder; leave that for the calf. We give a drink of tepid water, less fever, we add a dessertspoonful of saltpetre (pulverized) dissolved in hot water, to allay fever.

For a day or two, perhaps for four or five days we are careful as to feed In summer, we can allow access to grass. In winter, clover hay, roots and some bran are, in our opinion, best till the condition of the system becomes normal. For the same time, we are careful as to watering. Twice a day, water from the chill has been removed is given, and, if the udder is swollen and hard, as it often is, continue to give tepid water to drink till the udder is cured, as much of the inflammation in the udder is intensified and often caused from drinking cold water.

The second day, as a general rule, we milk out the cow if the calf has not sufficiently reduced her udder, and her condition appears healthy. The next day she may be put back in her place in the stable. Ifthe udder is swollen, as before mentioned, we avoid cold drink, occasionally bathe with warm water, rub dry, and apply a liniment of wood alcohol and camphor gum (one pint to one cake), followed by an application of lard or other mild grease to close the pores; or apply camphor oil. We have also used soft soap and bella-donna (extract), one quart to two ounces, but prefer either to the former. If the udder does not reduce to normal conditions quickly with this treatment, a dose or two of Epsom salts may be necessary, but only when the system has passed the danger of milk fever.

By the time the cow's milk is fit to use, the calf has learned to drink, and the cow is satisfied to be separated from it.

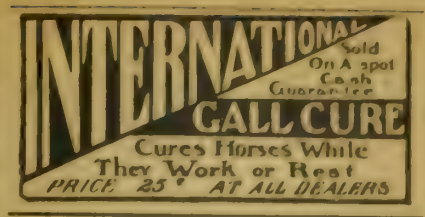
If the weather in summer or early autumn be wet, do not allow the newly-calved cow to remain out in the rain or lie upon the wet ground, until the system becomes thoroughly normal.

Our results are now satisfactory from this treatment. We have had no milk fever for five years, have good strong calves, and few ailments in cow or calf. C. M. Macfie in Farmers Advocate.

Barreness in Cows.

"A cow may appear at oestrum in a perfectly natural and regular fashion, and yet there may be some obstacle, which may or may not be removable, rendering conception impossible. There are a number of diseased and altered conditions of the generative organs that are capable of proving a complete barrier to fecundation." You want to know something about the obstructions and malformations which interfere with breeding. They include diseases causing alteration in the ovaries, fallopian tubes; uterus, and vagina, while growths or tumors of various kinds in these organs are frequent causes of sterility. One of the most common obstacles to breeding where the animal appears regularly in season—the most common, that is, with the exception of that altered condition of the secretion of the vaginal mucous membrane which destroyes the vitality of the 2,000 germs before they have time to gravitate into the uterus, is some abnormality of the neck of the womb. Contracted os, malf formed os, and a non-retaining vagina are recognized causes. The contraction may be a temporary or permanent drawing up of the neck of the womb, so that the seminal secretion of the male cannot enter it, while malformation generally means that the crevix is not of proper shape. It may be elongated, conical crooked, or have a membrane obstructing the entrance. Attention has already been called to the advantages of a physical examination by an expert to determine whether any such obstacle exists, and to the possibility of its being overcome by resort to artificial insemination.

Most of us manage to sell a few dollars' worth of feed along in the late fall or early winter, when it is a moderate price ; then run short of feed ourselves, in the spring, at a time when corn and all roughage are at their highest price. This ought not to be regarded as simply carelessness, but rather as extreme foolhardiness, since it is done by some, year after year, and they never seem to take warning at their continued shortsightedness,



MOLASSINE MEAL

Keeps ALL Horses in the PINK of condition.

The MOLASSINE Co., Ltd., Greenwich, S.E.

WARNING
Avoid foreign Imitations or you will be landed with heated, fermented, useless foods, only fit for the manure heap.

What Do You Feed Your Animals?

Have you seriously considered the question of returns for your good money spent buying Middlings, Bran, Cornmeal, etc. at the present high prices?

But, you say, what shall I feed to get good results? The answer is MOLASSINE MEAL. If you have not used MOLASSINE MEAL, you do not know of its good qualities. You have undoubtedly heard of it. Actual experience brings conviction. Buy some TODAY and see the result on your HORSES, CATTLE, PIGS, SHEEP and POULTRY.

MOLASSINE MEAL is made in England, of Pure Cane Molasses and the best that Mother Nature can produce in the way of a Vegetable Product which neutralizes the effect that Molasses, in its ordinary state has on the stomach of all Animals.

If your Dealer cannot supply you, please write us and we will tell you how to obtain better results by feeding MOLASSINE MEAL.

L. C. PRIME COMPANY, LIMITED

DISTRIBUTORS. St. John, New Brunswick.

Hogs Proved Profitable.

Here is a little pig story I would like to tell. I don't claim to have done anything wonderful, but these are actual figures. August 7 I bought four five-weeks-old pigs, paying $10 for them. I fed them what skim milk I had, which was not much, as I was only milking one cow. I had plenty of little potatoes, which I boiled, and later varied these with windfall apples, also boiled. I bought a bag of middlings for $1.65 and gave them a handful or two at each feeding. September 25 I sold two of the pigs to a neighbor for $10, thus getting back what the four had cost me, minus $1.65 paid for middlings. At this time the pigs, or rather shotes, weighed between 60 and 70 pounds apiece.

The other two I kept, and as I soon had more milk I dropped middlings from their bill of fare. Soon after the middle of January I began to feed them meal. In all I bought four bags meal at $1.55, making a total of $6.20. March 4 I sold one which dressed 208 pounds for $16.50. March 19, I sold the other. He dressed 237 pounds and brought me $18.96. Reckoning out the price paid for the four pigs, $10, and what I paid out for grain for them, $7.85, left me $27.61 for my labor, skim milk, apples and potatoes.

GRAIN BILL WAS PAID.

Another bit of experience may be interesting. It always seems as though the greater part of my money is spent for grain, for although we keep books in a rough way, we seldom balance them up. The other day, I did a little figuring, just out of curiosity. What I found out surprised me some. During the year 1911 I had two cows, excepting the time from September 16 to November 4. I vealed one calf which I sold for $8.50, and had another one, which I was vealing, which was two weeks old at the end of the year.

The family, which most of the time consisted of four, had all the butter, milk and cream they wanted. We used quite a lot of cream for cooking and whipping, and from 1½ to 2 quarts fresh milk daily. I found that I sold butter enough during the year to pay the grain bill, lacking 74 cents. The grain not only fed the cows but also the horse, pigs and hens. I have had two hogs most of the time, and from 30 to 40 hens.

The Stallion.

There is no reason to worry about the sureness of a stallion because a large proportion of the mares first bred may return again later in the season. Mares do not naturally breed well early in the spring. They are much more likely to conceive after the weather gets warmer and their systems are cooled out by a little grazing. The small percentage of foals secured by the earlier spring services prompt many experienced stallioners to discourage farmers from bringing their mares in at all before the middle of April. They depend upon those who are determined to be early to bring in enough mares at the start of the season to get the stallion squared up in good shape for a hard season later on when his system has become accustomed to the renewed sexual activities. A horse that has been maintained in idleness all winter is also less likely to be sure at first than one having continuous exercise sufficient to keep the muscles firm and the circulation strong. Some impotent stallions have regained their vitality when the bondage of a close box stall has been exchanged for the freedom of the harness. That which can effect a cure in such bad cases will also prevent the trouble in the first place. Horses naturally take far more exercise than any other kind of stock. They require it for continued health. The stallion that has been rationally handled up to the present period of the season should get a large proportion of his mares in foal from this time on.

We seldom clean out the poultry buildings or the chickencoops, but allow them to become filthy and foul-smelling, then foolishly wonder why our fowls arr unhealthy, and why we do not make a success in poultry-raising, when cleanliness is the very foundation upon which we must build up a profitable poultry flock.

BRAMPTON JERSEYS!

Champions of Canada. Champion of World.

In show ring we are champions of Canada. We have defeated the very choicest selections made in United States. We will be shipping a car of Jerseys to the Maritime Provinces early in May. Write at once.

B. H. BULL & SON, - Brampton, ONT.

Riverside Holsteins For Sale

Either sex, all ages, out of heavy producing show cows, also high grades, well grown and in good fit; sired by some of the best bulls in Canada. **LEA & CLARK, Victoria, P. E. I**

BELLEVUE STOCK FARM.

Bellevue won male and female championships and all the herd prizes in Shorthorns at the 1910 fairs. The championship for Ayrshire bull has been held by us for three years with our Morton Main's Gerthrope, an Osborne bred bull. All our prize winners, with the exception of our herd bulls were bred by ourselves. Write for prices or call and see us. We breed our winners and sell them too.

C. A. ARCHIBALD, Proprietor, TRURO, N. S.

Better Sheep and More of Them

Is the cry throughout the Maritime Provinces to-day. We are told by men who know that no where on the continent is there a country better adapted to the raising of sheep. Let me start you Mr. Farmer in this industry which is on the boom. Can supply you with some beauties. Write your wants. Correspondence solicited. **SUNNY BRAE SHEEP RANCH, Jas. A. Telfer, Sussex, N.B.**

COBEQUID FARM HOLSTEINS

We offer for quick sale, several bulls fit for service from cows with Record of performance tests of 12,715,75 lbs. of milk testing about 3.7 p.c. at 2 years 2 months, another with 13,283.5 lbs. milk and 512.67 lbs. butter when 2 years old and another with 18,482.75 lbs. milk and 753.3 lbs. butter in 1 year at maturity. These bulls are in good condition, well grown and straight. For particulars write.

SAMUEL DICKIE, - Central Onslow, Col. Co., N. S.

LET US SHOW YOU HOW EASILY YOU AND YOUR NEIGHBORS CAN HAVE A TELEPHONE SYSTEM OF YOUR OWN

YOU—you and your neighbors—would have a telephone system for your own community, if you only realized how easily you yourselves could construct it and get it going. If you knew, in detail, how you and the people around you could form, own and control a local, self-maintaining company, for your own use and convenience, you would have such a system. There would be a telephone system in your community to-day if you knew how easily you and your neighbors could build every foot of the line and install every instrument yourselves—and especially if you realized that you do not need very much capital to do it either. Now, there is no reason why you should not know all these facts; for we stand ready to give you, for the mere asking, every bit of this information, provided only that you are sufficiently interested in the subject to write and ask us for it.

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

We Send This Book FREE But Only On Request

"HOW to Build Rural Telephone Lines," is an illustrated, cloth bound book of one hundred pages, full of a carefully indexed mass of information on rural telephones. This book tells everything ; with it before you, you can organize your own company and construct your own line. It tells you absolutely everything you need to know, step by step, as you go along. There is no other book in existence that deals so thoroughly with every vital, essential fact. Remember, this book has cost a lot of money and careful study to prepare. We really ought to charge for it. However, we send it free on request—but ONLY on request. To get it you have to send us the coupon and thus signify that you are really interested. The book is too valuable to distribute haphazard.

We Will Explain All About Rural Company Organization

YOU do not need experience to organize a telephone company in your own community, when you have our book. It tells you exactly what you have to do and how to do it. All you need to do is to follow the instructions that the book gives and then get out and interest your neighbors. Whether you want to organize a mutual or a stock company, the book will tell you how.

You And Just Your Own Friends Can Build Every Foot Of Line

BUILDING your own line keeps down construction costs. With the help we give you, you do not need to employ expert linemen. The book explains the last word in line construction and contains, in this one chapter alone, thirty-seven diagrams and illustrations, showing how to make every kind of connection necessary, how to route the line, how to put the fittings on the poles, how to guy the poles, how to place the insulators and string the wires—in fact, how to handle every detail as well as an expert lineman can. On request, we will also tell you of your provincial regulations, what your government requires and what it will do to help you.

The Cost To Operate Your Own Line is Low

YOU can readily understand that when you and your friends have the entire management in your own hands, you can regulate the cost of running the line. In the book we explain just exactly what is necessary and you can take your pencil and figure out how little it will cost you to have a telephone on the wall in your own house.

Let Us Explain To You How To Interest Your Neighbors

THE first step in getting started, is to enthuse your neighbors and get them all in with you. When you have read "How to Build Rural Telephone Lines," you will have a mass of information at your finger ends that will enable you to place positive, definite facts before your friends, to enthuse them with the idea of a self-maintaining, community-owned system and to make everybody around you anxious to help. All it needs to get a telephone system started, is for some one progressive man to start the ball rolling. With the information that we will place at your command, you can get everything organized in short order.

There Will Be A Telephone System In Your Locality — Get Posted

SOONER or later someone is going to start a telephone system in your community, just as systems are being started every day in farming centres throughout the Dominion. When this subject comes up, you will want the full particulars before you. Now is the time for you to post yourself. The book tells you everything and, if you are interested, we will be glad to send it to you free. Do you care to sign the coupon and send it to us now?

PAGE 'ACME' LAWN FENCE

This famous 'Page' Fence comes in rolls up to 200 ft. in length. These are painted either white or green, and you may have "Page Acme" Fence in any height from 2 ft. to 6 ft. tall.

Be sure and get the genuine "Page Acme" Fence, for there are imitations on the market that resemble this fence closely. By getting the genuine "Page Acme" Fence you obtain high-carbon steel wire uprights, which are as stiff as thick iron rods.

This "Page Acme" Fence makes a beautiful fence for lawns, cemeteries, semi-public institutions, parks, etc. It is remarkably low in cost. When you consider the long life it has from being painted at the very beginning of its service, before you even set it up, you will see how economical it is to use this "Acme" Fence.

We have sold hundreds of miles, especially of the 42-inch width, and you will find this "Page Acme" Fence doing service all over the country. Write us today for the Page Catalogue of "Acme" Fences. If you need fence of any kind, remember the Page Catalogue shows it to you at Factory Price—scores of fences of the best quality.

Send Today for the Page Catalogue

This catalogue shows all kinds of Lawn and Farm Fences, fence material, iron fence—everything you possibly can need in this line at moderate prices. Write us today for the Page Catalogue.

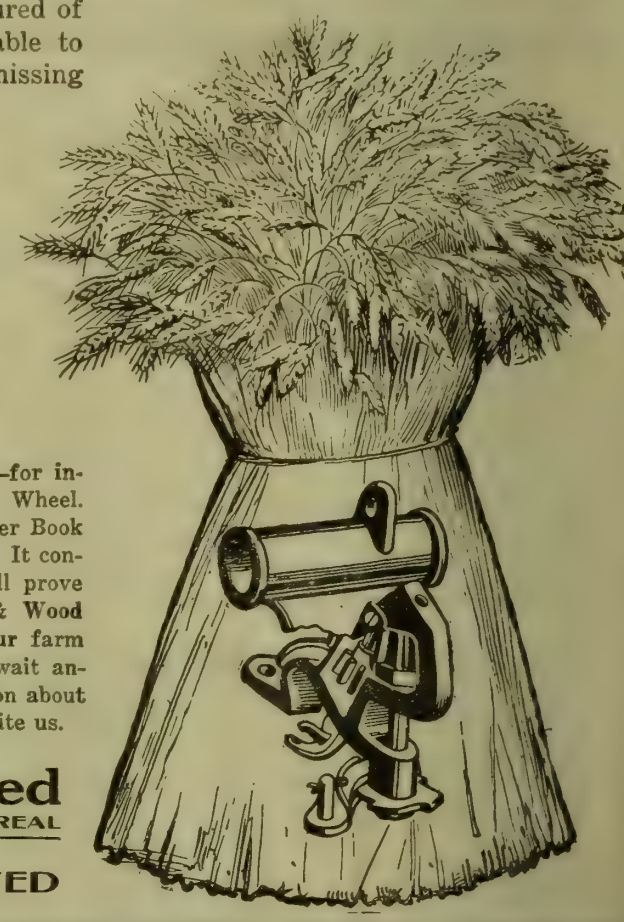
Always Ready for Hard Work

Long Hours or Lodged Grain Do Not Bother This Binder

The **Frost & Wood No. 3 Binder** was built purposely to stand up and work satisfactorily under the heaviest and most trying conditions to be met with in Canada. Long hours in the field may tire you, but the No. 3 is always ready for more work. Lodged Grain—Short Grain—Long Grain—the No. 3 cuts and ties it all into tight, compact bundles. In **buying** a Binder you want to be assured of three things—a machine that will cut **all** your crop; that is able to elevate and bind it into sheaves without crowding on the deck or missing at the Knotter; and one that is easily handled and light in draft, yet capable of standing hard work. You'll find these in all



Frost & Wood Binders

The Cutter bar is so arranged that the guards get down under the most tangled grain and save it all. The Reel is easy to operate—back, forward, up, down—so you can instantly shift it to suit varying conditions. That means clean work. Elevators have ample capacity for handling the heaviest and lightest crop, and **Frost & Wood Knotters** have yet to be equalled for sure and positive work. Run the Binder as fast and as long as you like—you'll find it always ready to tie the next sheaf.

Are Light Draft Machines

Carefully-fitted Roller Bearings are put in every part where they will make things run easier. These Bearings on **Frost & Wood** machines are made to last and do their work. They won't fall apart and clog as do some others. They are there to make the Binder draw light, and they do it. The No. 3 is certainly easy on horses. There are features other than the presence of many Roller Bearings that account for this—for instance the Eccentric Sprocket Wheel. You should get our special Binder Book describing the machine in detail. It contains much information that will prove interesting to you. A **Frost & Wood Binder** will do the work on your farm as you want it done, so don't wait another day to get more information about it. Ask our nearest agent or write us.

THE Keeley Cure

For Liquor and Drug Using

WHY WE SUCCEED

Because of the true merit of our remedy, of the honesty of our statements and of the half million cured men and women, who can, do, and ever testify to the positive cures made by this treatment. Over thirty years constant use of the Keeley remedies demonstrated not only that Alcoholism, Morphinism, Cocainism, in fact all narcotic drug using, is a disease ; but through Dr. Keeley's system of treatment absolute, positive cures are made.

Time, which tries all things, has proven that the Keeley Cure does cure. Have you not a relative, friend or neighbor who is wasting his health, substance, and happiness of self and family with either drugs or liquor. **HE CAN BE CURED.** We can restore him to health, to earning capacity, to care of his family, to respect of his friends and business world. Our relations with our patients are strictly confidential; there is no publicity in attending this Institute. There are no unpleasant restrictions, no contact with the low, immoral or debased. Those that come to us are the representative men and women of the community who, realizing that the liquor or drug is fastening itself upon them, determine to quit, and in place of doubtful experimentation at home come here for assistance.

The methods and treatment are without shock, inconvenience or harmful tendencies, and the patient passes from the addiction to a cure so easily and comfortably that he hardly realizes that he is the subject of medical treatment.

The treatment removes all craving or desire for liquor or drugs, restores the nervous system to a normal condition, clears the brain, and makes a man out of a nervous wreck.

Patients are not confined; there is no irritating or vexatious restraint.

There is no Nausea or other Sickness attendant upon or caused by our treatment. Improvement begins at once and continues throughout entire course of treatment.

We have special accomodation for ladies, where they can be entirely exclusive, and can be treated as privately as in their homes.

Printed matter and particulars by mail in sealed plain envelope.
All letters promptly answered and treated as strictly confidential.

DE LAVAL
CREAM SEPARATORS

Their Great Simplicity

DE LAVAL CREAM SEPARATORS EXCEL ALL OTHER separators not only in thoroughness of separation, sanitary cleanliness, ease of running and durability--but as well in their great simplicity.

THERE IS NOTHING ABOUT THE operation, cleaning, adjustment or repair of a modern De Laval Cream Separator which requires expert knowledge or special tools.

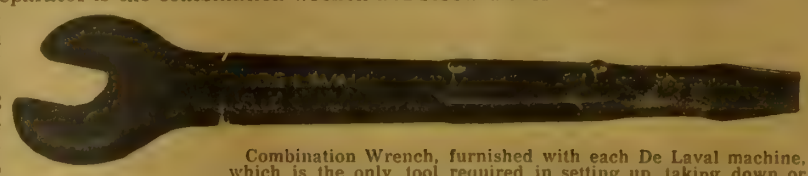
NOR ARE THERE ANY PARTS which require frequent adjustment in order to maintain good running, in order to conform to varying conditions in the every-day use of a cream separator.

THERE IS NO NEED TO FIT and adjust parts to get them together right. They are so carefully and accurately made that they cannot help go together right. All bearings and bushings are easy to replace. There are no complicated springs, keys, ball bearings or other fittings, that only an expert can properly adjust.

IN FACT, SO SIMPLE IS THE CONSTRUCTION OF A DE LAVAL machine that a person who has never touched a separator before can, if need be, take a modern De Laval machine completely apart within a few minutes and then put it together again as quickly. This is something which cannot be done outside a shop with any other separator.

THERE IS NOTHING ABOUT THE MACHINE THAT cannot be taken apart, removed or replaced by any one who can use a wrench or screw driver, In fact, the only tool which is needed in the use and operation of a De Laval Cream Separator is the combination wrench and screw driver illustrated below.

THE ONLY WAY TO PROPERLY UNDERSTAND and appreciate De Laval superiority to other separators, is to look over, and better still to try, a 1912 De Laval machine. Every De Laval agent is glad to afford prospective buyers the opportunity to see and try a De Laval Separator.



Combination Wrench, furnished with each De Laval machine, which is the only tool required in setting up, taking down or using the De Laval, the most simple cream separator ever built.

Complete gearing of the De Laval Separator as it would appear if removed intact from the frame of the machine. Note the remarkable simplicity of construction.

Early Importations of Noted Horses to P. E. Island

By John Richards.

THE history of our great breeding horses is not written as it should be, and unfortunately what little has been written has not been properly preserved.

In the Old Land they preserve the history of their famous race horses and racing progenitors better—indeed with great care; but this is not strange, for they honor their dead "Prophets" better than we do, and why not their great horses? He who wishes to learn the story of our "Roncesvalless," our "Revanges," our "Saladins," our "Columbuses," and other great sires, whose blood laid the foundation upon which the fame of our Island horses was built, will nowhere find it written with any method or degree of completeness—in fact it has never been published except in stray paragraphs in our earliest newspapers. Therefore my readers must be content with a very imperfect and inadequate account of the great horses imported here in the early days—indeed in many instances it was with difficulty that even the approximate dates of their importation could be ascertained.

"Barrister"

The first importation of which the writer can find any record is that of "True Briton," a Suffolk Punch, brought here from England in 1824, and taken to King's County. It may here be mentioned that the "Suffolk Punch" was named from its native country of Suffolk, and from the thick set body on short legs. Its chief points of difference from the Shire and Clydesdale are its chestnut color and its freedom from the abundance of long hair on the legs. The Suffolk is very docile, easily kept and capable of any amount of hard work. As a breed they are very prolific and long lived—one mare on record having lived till she was 37 years old.

"Roncesyvalles," a noted thorough-bred and excellent breeding horse, was brought out from England by Governor Ready in 1826. "Wanto," (thorough-bred), was imported in 1827. "Stag" (thorough-bred,) was imported in 1833. "Revenge," (thorough-bred), came from the United States in 1833. He was a son of the great first "Bush Messenger," the founder of the "Hambletonian" trotting family. "Rainbow," (thorough-bred), came the same or following year from the States and was also a son of 1st "Bush Messenger." He was very handsome and much admired.

In 1836 two more thorough-breds were imported from England. "Tideworth" and "Aurelian." The former was owned by a Mr. Woodman and the latter by Governor Fitzroy.

The old Royal Agricultural Society imported "Columbus" (Clydesdale) in 1839. It is worthy of note that "Columbus" was the first Clydesdale horse to be brought across the Atlantic—in fact only one other draft horse of any breed was brought over before that date,—that was a Percheron, brought over from France to Philadelphia. Thus the honor of bringing the first representative of the now world famous breed of draft horses across the Atlantic, belongs to our Island. Dr. Dick, then head of the Glasgow Veterinary College, selected "Columbus" for the Agricultural Society. He did not receive his name from the famous and intrepid navigator who discovered America, but from the sailing ship of that name, in which he was brought from Great Britain to Miramichi, N. B. A man named W. Shaw had charge of him on the long voyage. "Columbus" was not a large horse, as compared with many of the Clydesdales of the present day. The writer is informed that he weighed, with a boy of fourteen years old on his back, 1640 pounds. He was, however, an extremely active horse and could trot a three minute gait. He proved himself to be a wonderful breeding horse and it is a noteworthy fact that the dams of many of our old time fast trotters—notably "Fairy Queen," the dam of "Dean Swift" were by "Farmer Glory"—a son of "Columbus," from a thoroughbred mare.

In those days our Island could boast of a splendid class of brood mares—chiefly the progeny of the earlier importations of high class thorough-breds, and these intermingling with the blood of "Columbus" through his sons from thorough-bred mares produced a type of carriage roadsters and saddle horses, the like of which we perhaps never had before nor since.

"Fairy Queen" deserves more than a passing notice, as she was one of the best bits of horse-flesh that our Island has ever produced, and has the distinction of being the dam of that good breeding horse "Dean Swift" who founded a family in this Province noted for their splendid road and other useful qualities. The ancestry of "Fairy Queen," on the dam's side, for several generations were thorough-breds of the highest class, as the following will show:

"Her dam was a daughter of "Royal Sporter," (thorough-bred), grand dam by imported "Stag" (thorough-bred.) "Royal Shorter's" sire was old "Revenge," (thorough-bred) by 1st "Bush Messenger," above mentioned. "Fairy" was queen of the Maritime turf for several years and won many memorable races on the ice. She was a noted roadster and for gameness and endurance had few, if any equals. She was owned by the writer for several

years at the close of her career and produced some valuable stock. Both "Fairy" and "Dean Swift" were bred and raised by Robert Fitzsimmons, Esq., of Long River, New London, from whose stud many of the Island's best and noted sires have come. Mr. Fitzsimmon's fame as a successful breeder of light harness horses, is not by any means confined to his native Island, but is known throughout the Maritime Provinces and in many of the Eastern States, where his horses have competed in numerous, hard fought races.

"Saladin" (thorough-bred) was imported from England in 1845. He came out in a sailing vessel in charge of the late Mr. John Osborne, who informed the writer that during the long voyage of over forty days "Saladin" never once laid down, but seemed none the worse for his experience. "Saladin" was a bay in colour standing a little under sixteen hands and would weigh in fair condition about 1200 lbs. Few sires, if indeed any, that have ever been brought to our shores did more to improve our class of carriage horses and roadsters than "Saladin"; and this would be expected of him from such an inheritance as he possessed. His sire "Bay Middleton" winner of the Derby and many other classic events of the turf, the property of the Earl of Jersey, was the greatest sire and racer of his day. He was an ill-shaped horse, but possessed wonderful speed.

In 1855 the Royal Agricultural Society purchased in the United States three horses for breeding purposes, namely, "Sam Slick," "Telegraph Morgan" and "Eclipse." The same year the Society imported two English Coach horses, "King of the Valley" and "Waxworth." A thoroughbred "Mountaineer" came about the same time and left some good stock. His sire was "Mulby Mullock," a celebrated horse.

"McInnis Pony."—Unfortunately but little information can now be got regarding the early history of this wonderful little horse, whose blood exercised such an influence on the Horse breeding interests of the Island, more particularly in King's County and the Eastern parts of Queens, where he was owned for a number of years. He was then sold to one Hugh Province of Quebec in the year 1854, by Dr. H. B. Hillcote, who in the spring of 1855 purchased Keppoch Farm near Charlottetown, where the little horse was kept for some two years. He was then sold to one Hubh McInnis, from whom he received his name. Mr. McInnis drove the mail between Georgetown and Charlottetown for several years, and made use of the game little stallion for this purpose. The "McInnis Pony" as he was called, is well known by reputation to all horsemen in our Province, and no doubt there are many who remember him. Like the "Flying Frenchman" he was probably of French Canadian extraction, and there is but little doubt that his ancestors, not very remote, carried a good drop of thoroughbred blood in their veins. He is described as a handsome pony, brown in color, possessed of wonderful pluck and endurance, with great style, high action, and considerable speed,—all of which qualities he transmitted to his progeny in a marked degree.

"Flying Frenchman" was brought here in the early sixties from the Province of Quebec by—so it is alleged—two peddlers, who becoming financially stranded, were obliged to sell their horse and outfit. He was a small horse of the pony class, a chestnut in color, handsome and high spirited, with almost phenomenal speed at the pace, hence his name. There are many stories as to his origin, but there seems but little doubt that he had a strong dash of thoroughbred in his veins. His gameness and prepotency as a sire would clearly indicate this. He had no superior as a sire of fast, durable roadsters, many of them with extreme speed, and to this day wherever there is a drop of his blood it will assert itself.

The next importations were old "Clyde" and "Stockman," both Clydesdales, and which did much to improve our class of draft horses of that day.

"Gull," as far as the writer can ascertain, was purchased in Quebec by the late Joseph Belony Perry, of Miscouche, about the year 1868. "Gull" was a dapple grey of the large carriage type, a powerful horse, with plenty of bone of the right quality. He had good action, and in those days was looked upon as quite a fast trotter. As a producer of sizeable carriage and driving horses, useful for almost any work upon the farm, kind disposition, but with plenty of ambition, "Gull" stands in the very front rank amongst our best sires.

"Gladstone," (Clydesdale) was imported by the Government in 1871, selected by the late Wm. Bagnall. He was bred and raised by Robert Beith (now Senator Beith) of Bowmanville, Ontario. His sire "Neatherby," was considered one of the best Clydesdales that ever crossed the Atlantic. His dam was a very noted mare, winning no less than thirty-two gold medals at different shows in eleven years. She was sired by "Gray Clyde," a good breeding horse and noted as the first Clyde ever brought into Upper Canada. "Gladstone" was purchased by Mr. P. McBride, of Central Bedeque, in 1875, who had the misfortune to lose him in 1882. He was gray in color, of medium size and extremely active. He was highly regarded as a breeding horse and left some excellent stock, mostly of the agricultural type.

"Bush Messenger," a trotting bred horse, a descendant, no doubt, of the first "Bush Messenger" before referred to, was brought here from the States about the year 1873. He was a dark chestnut, rather undersized, but very handsome and stylish. He was the sire of "Dean Swift" already mentioned, and many of the best road horses of their day.

About this time several valuable thoroughbred Stallions were brought here from Kentucky, by Dr. J. T. Jenkins, who at different times bred and owned some of the best in the land, trotters, carriage-horses and saddlers. Among the latter was the well known "Royal Harry," a horse standing over sixteen hands, and of wonderful style and beauty. In 1875 he was sent to the Great International Exhibition in Philadelphia, where he carried off first prize in a very strong class of carriage stallions.

Dr. Jenkins, who is recognized as one of the keenest sportsmen in all Canada, has always been an ardent lover of good horses, and there are few who have done as much, both by precept and example, to encourage the important industry of horse breeding in our Province. Despite his advanced years he still retains his interest in horses, indeed in all agricultural matters. At the present time he owns several fast trotters, well known on the Maritime Turf.

"All Right," a celebrated trotting horse, whose name came to be a household word in this Island, was brought here from the State of Connecticut, in the year 1877, by Mr. Newton Lee, now residing in Truro. Mr. Lee, though not a wealthy man, had the pluck to pay $3000 for this good horse, which is, we think, the highest price ever paid for a horse to be brought to our Province, and at that time would be regarded as a stiff price anywhere in America. "All Right" proved to be an excellent breeding horse, and with but comparatively poor opportunities, produced a large number of fast trotters, which worthily upheld the fame of our Island on many a race course throughout the Maritime Provinces, and in the Eastern States. He was a dark bay in colour, of handsome outline, standing about 15.3 hands. He was sired by "Targatts" Abdallah," dam by "Rysdyks Hambletonion."

"Hernando" was purchased in Kentucky, in the year 1888, by W. McLeod, now of Winnipeg, and Judge McLeod, of Summerside. He was sired by "Almont," one of the most successful sires of the day. "Hernando" was a dark bay of good size, and handsome conformation, and left a very useful class of carriage horses and brood mares, as well as some fast trotters.

"Barrister," whose picture graces our first page, came here in the spring of 1881, when he was three years old. He was selected and purchased in the City of York, England, by C. C. Gardiner, Esq., who is recognized as one of our best judges of horses, and no further proof of this is wanting than the selection of such a good horse as "Barrister" affords. It seems superfluous to say much in these pages about the achievements of "Barrister," in the stud as these are well known to the majority of my readers in the Province who are at all interested in horse breeding. That he was a great sire all will admit, indeed it may not be too much to say, that his superior never crossed the Atlantic. His progeny for several generations won distinction in the prize rings of this and the neighboring Provinces, also in the State of Maine, to which many of them were taken at long prices; and in the breeding ranks they were no less successful. "Barrister" himself was a frequent prize winner at the leading Shows in the Old Country, as a yearling and two years old. At the great Royal Show as a two years old, in competition with many of the best in the land, he was highly commended. In this country he never met defeat when in his prime. He was a bay in colour, powerfully built at all points, large, well shaped feet, and with a set of legs that denote both strength and quality of bone. His weight at three years old was about 1700, and at five years, close upon a ton. He was sired by "Emperor," 1155 Clydesdale Stud Book—a noted horse for which the high price of 600 guineas was paid. His dam "Bounce" was by "Honest Tom," the greatest shire horse England had produced, he having taken no less than six first prizes in succession at the Royal Society Show. "Bounce" was regarded as one of the best mares in the three Kingdoms, in her day, and rarely met defeat in the show ring.

It will be noticed in "Barrister's" breeding that his sire was a Clydesdale and his dam was got by a shire horse. It is well to state that before the inception of the draft horse stud books in England and Scotland, horses were frequently bred in these lines, and many of the best horses in Scotland, notably "Prince of Wales," "Darnley" and the superb show horse "Prince of Avondale," were evolved in this way, and are now regarded as among the greatest progenitors of the Clydesdale breed.

In 1884 the shire horse "Oak Heart" was imported from England, by George Tweedy, Esq., of Alberton, who also imported, in 1885 the thoroughbreds, "Early Clifden" and "Aquilaus." These latter were sold shortly afterwards and taken out of the Province. Mr. Tweedy imported in 1887, the shire horse "Honest Lincoln," sire "Lincoln" dam by the noted "Honest Tom." "Honest Lincoln" was an excellent type of the shire horse and did good service in the stud. In 1888 the Yorkshire Coaching Stallion "Premier" was imported by Mr. Tweedy, and in 1889 the shire "Lucky Harry."

Mr. Tweedy, though a lawyer by profession, has always taken a deep intelligent interest in agricultural matters, is a keen sportsman and one of our best judges of horses.

"Bunk Island Hero," a large and typical draft horse, and which left some valuable stock throughout the Province, was imported in the eighties by Thos. Robins, Esq., of Bedeque, who in his time has owned a number of very good stallions, both heavy and light. Mr. Robins has always taken a keen interest in our horse breeding industry, which needless to say, he has done much to promote.

"Lucky Lad," a pure bred Clydesdale of handsome conformation, and that stood well up in the list of winners at the Glasgow Stallion Show, was brought out by Mr. C. C. Gardiner, in the spring of 1887, being then three years old. He proved a valuable breeding horse.

At the same time, the well known horse, "Knight of Ardgowan" then three years old, was imported by the writer. It is perhaps not too much of an exaggeration to say, that few horses that ever stood for service in this Island produced more desirable stock than did the "Knight." His get were noted for soundness, robust constitution, docile disposition, and a capacity and willingness for hard work. They were generally regarded as ideal farm horses. The "Knight of Ardgowan" was a superbly bred horse, his sire being the noted breeding horse "Top Gallant," whose get were remarkable for their high quality, especially in underpinning—the all important point. "Top Gallant" sired "Sir Everard," who in turn produced the now world famous "Baron's Pride." It will thus be seen that the "Knight" and "Baron's Pride" were closely related.

"Administrator" (trotter), was purchased in the United States by the late Alfred Gourlie in the spring of 1887. He was by "Rysdyks Hambletonion"—one of the few sons of the old horse then living. It is worthy of mention, as a tribute to our Island bred mares, that though "Administrator" was twenty years old when brought here, and though he had unusual opportunities in the stud in Kentucky and at other breeding centres in the States for many years, yet he produced his fastest trotter in this Island, namely, "Dot" 2.18 and from a "Dean Swift" mare.

"Preceptor" (trotting bred), was bought in Kentucky in the spring of 1888, by Messrs. Gardiner and Heartz. He was sired by "Nutwood" among the leading sires of his time or indeed of all time. Dam by "Pan Coast," a well known sire. "Preceptor" left a good number of high class driving horses and quite a few that won distinction on the turf. With better opportunities, he would no doubt have earned a high reputation as a sire of fast trotters.

The well known and successful breeding horse "Parkside" was purchased by W. A. Brennan, Esq., of Summerside, at a sale of horses held in New York in 1889. "Parkside" was sired by "Clay," son of "Electioneer," dam by "General Benton." He produced many noted turf performers, both trotters and pacers. His best son was probably "Parkwood," bred by that veteran horseman, Mr. John McPhee, of Freetown, who bred many good ones, and who has done much to encourage and promote the breeding of high class trotters and drivers in our midst. "Parkwood" was not only a fast trotter himself and a sire of many fast ones, but also won great distinction in the show ring. He was sold to a gentleman in New York at a high figure, and afterwards carried off first honors in his class at the big horse show held annually in Madison Square Gardens, New York, and open for competition to the whole world.

There are several other high class stallions of different breeds imported in recent years and Island bred that should be noticed in detail, if it had been the writer's purpose to include in this article a reference to all the

How I Grow Potatoes on a Business Basis.

By John Howlett, Annandale, P. E. I.

Awarded Third Prize in The Maritime Farmer's Potato Growing Contest.

I can grow potatoes successfully as I am located near a shipping port, where I can dispose of all I can grow.

Now, how do I grow them, and how do I handle my land to grow them successfully?

We will take one acre. This land had two crops of hay taken off it, mostly clover hay, then one crop of oats. As soon as the oats are harvested, I plow the stubble under and harrow it well. I leave it in this state all winter. I provide sixty loads of well rotted stable manure.

About the twentieth of May, I plow this land again across the former plowing, and disc-harrow till quite mellow, then putting on my sixty loads of manure which I find plenty to cover the acre, leaving the manure spread on the ground twenty-four hours before planting potatoes. I find from experience that results are much better than planting immediately after spreading. However, before planting I sow two-hundred pounds of Sulphate of Potash over the manure. I plow in the potatoes every third furrow or thirty inches between rows, the sets seven inches apart, and four inches deep.

When through planting two hundred pounds more of Sulphate of Potash are sown over the acre and harrowed in with the spike harrow. This is necessary not only to well mix the fertilizer with the soil but also to keep the air from the sets.

I prefer two eyes to a set and I must have the best potatoes I can select. The best time to choose potatoes for seed is when digging; handle them carefully and keep them in a cool cellar till planting time. I prefer keeping them in barrels. By following the foregoing directions, I have raised from four to six hundred bushels per acre.

The expenses of raising this acre of potatoes are as follows.

Rent of land	$10.00
Fall ploughing and harrowing	5.00
Preparing land in the spring	3.00
60 loads of stable manure @ 25c. per load	15.00
Hauling manure and spreading	2.50
400 lbs. of Sulphate of Potash	8.00
12 bus. of potatoes @ 50c. per bus.	6.00
Cutting sets and planting same	2.00
Ploughing in potatoes	1.75
Harrowing, moulding and scuffling	3.00
Digging and culling	6.00
Shipping 400 bus. potatoes	5.00
Expenses	$67.25
I sold 400 bus. potatoes @ 40c.	$160.00
50 bus. cullings @ 25c.	12.50
Net proceeds	$172.50
Expenses	67.25
Net profit	$105.25

By H. L. Flemming, Debec, N. B.

Awarded Fifth Prize in The Maritime Farmer's Potato Raising Contest.

Four acres of land (off which the second crop of clover had been cut) were secured at a rental of $10.00 per acre and immediately plowed at a depth of about six inches. Occasionally, during the summer, it was scuff harrowed, thus drawing the heat and holding the moisture and hastening the rotting of the sod.

In the spring the land was again well harrowed until a fine seed bed was formed, then rolled to give a smooth surface.

Aside from the natural fertilizing elements contained in the soil thus prepared a high grade (Great Eastern) fertilizer was applied; 1000 lbs. being the amount used per acre. It might be stated here that a number of potato growers co-operated in securing this fertilizer and by buying by the carload the price was considerably reduced, costing $37.50 per ton. The applied fertilizer was put in the ground with the seed, at the time of planting.

Selected potatoes of the Green Mountain variety of a medium size were secured and prepared for seed, each seed containing two eyes.

This seed was immediately planted with a modern potato planter, about four bbls. of seed being used per acre; the hills being 11 inches apart and the drills 34 inches apart, covering the seed very light.

About eight or ten days after planting, the rows were covered with earth. This operation having two objects, viz. 1st, to help mulch the ground and 2nd, to destroy the weeds.

As soon as the tops broke through the ground they were again covered. This second covering promotes a more thrifty stalk.

As soon as the stalks re-appeared, the cultivator was run through them to take the earth away on both sides the young plants, this operation being continued at short intervals until the plants were in blossom. During this time a weeder was occasionally run through the rows to destroy the weeds and to break up the soil.

Last, the horse hoe was run through them, hilling them up, being careful at the same time that a generous amount of earth was left around the plants.

When the plants were six inches high, they were generously sprayed with the Bordeaux mixture. This operation being continued at intervals of two weeks during the growing season.

This solution performs a two-fold service, viz. it greatly promotes the growth of the potato plant and it tends to destroy the parasite which is the cause of rot under favorable conditions and which is so disastrous to profitable potato culture.

During all this time a close watch was kept for the appearance of the potato bug and a preparation consisting of 1 pound of Paris-green to 50 gallons of water was applied with a sprayer at the time the young were nicely hatched, it being necessary to repeat this operation before the field was rid of these pests.

When the frost had killed the stalks making further growth impossible, the tubers were harvested, a Hoover digger being used for this operation.

The four acres yielding 600 bbls. of marketable potatoes, one half the crop was put on the market at once at $1.00 per bbl., the remaining half were stored in the cellar and at a later date disposed of at $2.00 per bbl.

It had cost $58.00 per acre to secure and prepare the ground and to plant, fertilize and harvest the field of potatoes. The expense entailed totalling $232.00 while the crop sold for $900.00 making a net profit of $668.00 or $167.00 per acre.

The potato crop occupied the first place in the crop rotation, the second being the grain and the third and fourth being occupied by the clover crop, two years crops of clover gives a growth to the roots which when plowed up and properly rotted supply elements which are most needed and which are most expensive in manufactured fertilizers, viz. ammonia and nitrogen.

Air and Fertility, By S. Edward Paschell.

Air consists essentially of oxygen 20 per cent. and nitrogen 79 per cent., with about ½ per cent. of carbonic acid and always a trace of water.

Soil chemists assert that it is impossible for plants to breathe air, and thus directly to secrete nitrogen (ammonia); but it is known that the clovers and their allies obtain nitrogen from the atmosphere through their root tubercles. A root tubercle is apparently not a true part of the plant, but is rather a colony or group of friendly microscopic parasites attached to a feeding root. A sort of mutualism exists; the plant giving food to the inhabitants of the tubercle, and they, in turn, supplying the plant with nitrogenous food.

It is a curious and very significant thing that root tubercles have also been discovered on certain plants not leguminous; and it may be learned, by and by, that tubercles or something corresponding to them are more universal than has heretofore been supposed. For the present, however, the farmer and gardener must rely on legumes for obtaining nitrogen from the air.

The significance of all this is, first, that the air contains a large percentage of that most expensive element of fertility—nitrogen; and, second, that there are feasible ways of trapping and holding it.

Air also contains oxygen, and the importance of this element must be emphasized. The oxygen of the air is active; the nitrogen passive. Give the oxygen a chance, and it will produce an endless series of changes. Admit it to the soil, and it will at once proceed to break down the old combinations and to form new ones. It will even attack the rock particles of which the soil consists, and will aid in tearing them apart and in making them soluble. Give a piece of soil a sufficient number of turnings and airings (without other treatment), and it will soon be ready to produce a new crop; not a maximum crop, but a fair one.

Sir John Lawes, of England, showed that a field could be made to yield a crop of wheat by culture alone, year after year, almost indefinitely. His experiment was conducted for more than half a century. The crop was always above twelve bushels of wheat per acre. The purpose was to learn the rate at which air, rain and sunshine can be made to produce plant food from the raw elements in the soil. The object was not to discourage the use of manures and fertilizers, but to emphasize the value of cultivation, and to show how man may unlock nature's inexhaustible storehouses. The steel-tooth cultivator, in this sense, is as important as the dung wagon.

Nobody questions or doubts the efficacy of tillage in field or garden, but it is seldom that the soil is pulverized and aerated to the maximum limit. The process usually ceases when a sufficient degree of fineness has been secured, whereas the liberation of plant food goes on as long as fresh supplies of air are introddced to the soil by means of the harrow teeth. Of course, the time comes when the amount of new plant food will not pay for further labor, and yet Clark, of Connecticut, is on record as having worked his hay field twenty-five times before sowing the seed. His hay crop was four to six tons per acre.

MANURES AND FERTILIZERS.

The pulverization of plant food (manures and fertilizers) is as important as the pulverization of the soil itself. Artificial fertilizers owe part of their quick action to their fine mechanical condition. They are within immediate reach of the air and water, and are at once available.

Stable manures are wonderfully improved and quickened in effect by what is called composting; that is, by breaking all the lumps and masses, and filling with air by repeated turnings. The oxygen acts promptly, resulting in a quick rotting or destruction of the vegetable fibre, thus making all the plant food available.

EXPERIMENTING WITH NIGHT SOIL.

An experiment or series of experiments with night soil (human excreta) made in southern New Jersey by the writer, some time ago, gave significant results. Night soil is one of the most difficult or one of the most easy substances to manage in the world, depending on the way the work is done. Kept away from the air, it will remain unchanged for months or years, but exposed to the air in a proper manner it can be converted into mellow valuable plant food in a week; yes, in a day, for I once performed the whole process between the rising and the setting of the sun, in midsummer.

The composting of human excreta (solid and liquid) is an exceedingly simple matter. The whole problem is to find a way to expose it to the air; or preferably, to both air and sun, for the most active and friendly of the bacteria work in fresh air, sunlight and moderate moisture.

I took the solid and liquid contents of the box under the outhouse, and mixed with double the bulk of finely-screened, mellow top-soil from the garden. That was just after sunrise. At 9 a.m. the heap was carefully turned with a shovel, and everything chopped fine. Another turning was

THE FARM HOME BEAUTIFUL.

There has been much said and much done by the residents of towns and cities all over the country in an effort to instill a sentiment of pride and ambition among home owners to fix up, clean up, decorate and otherwise make more attractive the grounds, buildings and improvements they occupy and call home. "The City Beautiful" is the inspiring call that is sent out broadcast by the cities of the land, as the watchword to be taken up, acted upon and passed along in the interest of home decoration and property adornment.

Why not some of this kind of sentiment aroused among the farmers? Why not more interest taken in making the farm home more attractive and pleasant as a place to live? It is just as important, from the standpoint of increasing property values, that the farm home be made attractive and desirable to the eye of the visitor and all who chance to see it as that the city home be neat and well kept.

Give the home on the farm room, give it a chance to spread out and have a place for shrubs, flowers, evergreens, ornamental shade trees, a lawn with plenty of room for green sward; nothing is so inspiring, nothing so pleasing, nothing so satisfying to a family as a comfortable, well-kept home. If there are long yards, calf lots, corncribs or other infringment on the grounds that should be taken into the dwelling inclosure, move them back, get them out of the way, relocate them where they naturally belong and give the dwelling and its attractive features at least an acre of ground; then enclose it with a substantial, good-looking woven wire fence that will exclude poultry and all other intruders that detract from the care and neatness of the front door yard.

A good dwelling, nicely painted and well equipped for the convenience of the housekeeper is the best investment that can be put into the farm. It will add years onto the life of the queen of the homestead; it will bring joy and pride into the very begin of each member of the family; it will be one of the strongest influences in bringing contentment and a feeling of satisfaction into the minds of the boys and girls. Did you ever stop to think, did you ever realize, that the stinted crowed condition of many farm homes, this lack of room, has been the means of discontent, the primary cause of driving the young man and woman out into the world? The desire of freedom, the desire to have a room all their own, a little privacy, a little sacredness and independence of this sort is only the natural development of human nature.

EXPRESS RATES AND REVENUES.

Another government bulletin, that of "express statistics," has just been published at Ottawa. Among the dry bones of these blue books, an occasional flutter may be seen. This one is full of facts for farmers and consumers generally. Although it covers all express companies doing business in Canada the principal ones are the Canadian (G. T. R.), the Dominion (C. P. R.), and the Canadian Northern.

The gross receipts for the Canadian Express Co. were $2,689,697.92; for the Dominion, $5,556,338.06; for the Canadian Northern, $564,279.54. After deducting the total expenditures, including $481,624.32 for dividends, there was a balance of $683,664.33. This profit represents 27.14 per cent. of the capital liability.

This is a pretty snug balance to add to the profit account. Many farmers will find it hard to sympathize with the railways, for these companies are held in trust, as the report states, for the railways, in their endeavor to add extra charge to their live stock, fruit and other shipments.

Such handsome profits ought to pay big taxes to the provinces in which they operate! Do they? The same report gives the total taxes paid at $19,695.78. This amount represents, on the gross receipts in round numbers, about one-fifth of one per cent. The average 100-acre farmer pays in direct taxes about $40 on a gross income of, say, $2,000, or a rate of 2 per cent. In other words, the farmer is taxed ten times as much as the express companies. The total cost of the real property and equipment of the three Canadian companies is given at $2,109,556.33. Their net earnings total $1,118,409.19, a sum over 50 per cent. of their investments. Could our average 100-acre farm, representing an investment of $7,000, pay similar returns—i.e., over $3,500 clean profit yearly, how long would a "back to the land" movement have to be advertised?

The farmers should insist upon a more just system of taxation, and that the express rates be lowered on all their commodities. Had the excessive profits from these public service corporations gone into the public chest, there would be no need for many of the present burdens on agriculture.

GOOD ROADS.

The good roads movement is kept to the front in urban oratory and after-dinner harangues. Glibly indeed roll out the well-rounded phrases from platform and press. Good roads are great things for the country. So are many other things in the reclamation process from nature.

Nevertheless, these things do not come in an insistent call from the farmer. It is not his voice that the promoters of good roads hear when their ears are to the ground. Automobile interests, machinery interests, etc., are having something to do with the sound waves.

Farmers need the good roads to their market towns. Agriculture is paying the brunt of our country's taxes. And it is the duty of the governments of the day to see that the farmer's burdens are lessened. His efficiency must be promoted. Every assistance to the production of improved crops should be given the farmer.

This whole Good Roads question must be taken up correctly. All money must be spent wisely, and all control of the lands left in the hands of the people most interested.

YOUNG AGRICULTURIST.

Dear Editor:

I am a reader of the Maine Farmer, and I see many anecdotes in the boys' and girls' column, so I thought I would write a few lines about what crops I raised last year.

On one-quarter of an acre of ground, I raised 29 bushels of salable potatoes, which I sold at an average of about ninety cents per bushel. On another quarter of an acre I raised about 275 heads of cabbage, 24 bushels of mangel wurzel beets, nearly two dump-cartfuls of pumpkins and squash, and about 50 sunflower heads, which I fed my hens. The pumpkins and squash were gone nearly four months ago, as they do not keep as well as cabbage or beets.

I own one house, 10 by 14 1-4 ft., and one-fourth of a house, 12 by 40 ft., in which I keep my poultry, 55 in number. My grandfather gives me all the land that I wish to plant crops on. I have one-half an acre plowed to plant potatoes on this year. I shall plant nearly an acre of potatoes, beets, corn, beans, and other crops this year.

I have lived with my grandfather since I was three years old, and now I am thirteen years old.

I would like to hear from some other boys and girls who read the Maine Farmer and have raised crops of their own, and that also keep some hens. My hens in the months of January and February yielded me a clear profit of $12.33.

If I see this in print, I will write about my experience raising potatoes at five years of age.

A DOLLAR A WEEK.

"It is mighty hard," said an unfortunate working man some time ago to a writer, to save up a thousand dollars by laying aside a dollar or two a week and then to take it out of the savings bank and lose it to a get-rich-quick swindler, as I have just done."

This poor fellow could work and save, but he had not had even a kindergarten education in finance else his story would have been different. He had never given a thought to interest, and so was absolutely ignorant of growth through compound interest, and of course, had never heard of that wonderful process of accumulation known as "progressive compound interest."

One dollar deposited in a savings bank that pays 4 per cent. will amount to $2.19 in twenty years. This is a simple compound interest. Now, if you deposit one dollar every year for twenty years, or $20 in all, the sum to your credit will have grown to$30.97. Any wage-earner can put by $1 a week. That money deposited in a savings bank for twenty years will have increased to $1,612. A deposit of $5 a week will have grown to $8,000, and this at 4 per cent. will be $320 a year. There is no secret nor mystery about this. It is clear as the cloudless sun and the method is just as clean and honest.

Community Co-Operation.

Community spirit and progress in any locality is due largely to a sympathetic co-operation of its members and a common ideal for better things. The co-operative spirit seems to find its most fertile soil where the dairy industry dominates. It is frequently said that the cow has a favorable influence on the establishment of the home. She plays a big part in furnishing food, wearing apparel and minor necessities of life. She has assumed a place in the activities of the farm which no other animal can fill.

Co-operation in a dairy community is potent in establishing a more highly organized social life. It fosters the demand and increases the prices for products ofthe dairy and stimulates moral and intellectual activity among the members of the organization.

However, as viewed by the unorganized community, such things have little value unless they show that co-operation can be made practical and profitable. The disposal of the stock in a community at a more uniformly higher price; the elimination of the poor cow and the improvement of the herd together with more profitable disposition of the dairy products, are the points in which the co-operative spirit first reveals itself. Wisconsin boasts of her highly organized communities, her co-operative creameries and skimming stations, her active trade in good dairy stock and her production of a better grade of dairy products. She also boasts of a social awakening, a demand for better methods of farming and an interest in better schools.

The desire for a higher standard on dairy stock resulted in the purchase of high class bulls. Sires of merit and performance created a growing demand for community stock. The man having but 10 cows and whose means would not permit the purchase of a high class sire by himself was given the use of such a bull and a larger field in which to sell his stock through the use of the community sire. Bulls could be used longer in the same neighborhood and the uniform standard of stock became an advertisement to the local community. This fact also enabled the purchaser to obtain a foundation herd in one place. Furthermore all of his stock was more uniform in type and performance. After the standard was once established a higher price and a more healthful demand followed.

The president of the co-operative system having a call for a specified number of cows or bulls makes haste to take a census of the available material in the community. After obtaining this information he informs the inquirer of the number, kind and prices. The transaction is closed and the members receive the amount which an able committee places upon the individual cows or bulls.

This is not the only line of improvement in the community stock which is of much value. The boarders in the herd and the low butter-fat producers, together with the poor type cows, are eliminated particularly through the use of the scales and the Babcock tester. A test association is organized. One man, the cow tester, gives his entire time to the association. He visits one herd each day, hence he is able to visit each herd once a month. He arrives in the afternoon, weighs the ground and rough feed that each cow eats, estimates the value of the pasture feed, weighs the milk of each cow night and morning, and tests it for butter-fat. For one day each month the tester knows how much butter-fat each cow has produced and how much it costs to produce it. He multiplies this one day's record by the number of days in the month and enters the same in the record book. A copy of this report is left with the farmer. The tester makes 12 visits to each farm during the year and at the end of that time every farmer in the association knows approximately how much butter-fat each cow has produced and how much it cost to produce it.

The tester becomes a dairy specialist. He sees the business not from his viewpoint only, but from the viewpoint of 26 practical farmers. He knows exactly what each man in the association is feeding. He has the different rations fed on the different farms all copied in the record book. These records are accessible to every man in the association. It is the farmer's privilege to study them when the tester visits his place. The value of this information to the members of the association can scarcely be over-estimated.

A system of marketing the dairy product of the community, whether it be milk or butter-fat is another feature of successful co-operation. The dairyman located near the city present time the membership of a co- his demand is in little need of co-operation with his fellow dairymen. On the other hand where many small dairymen are supplying milk of nearly the same quality to the city a central distributing point will place such a business on a firm foundation. The patrons guarded by the rules of the organization will pay a higher price for their milk and can always rest assured that they are getting a product that will bear inspection and be of uniform quality. Such co-operation forces the swindler and unclean dairyman out of the business. The contaminated product never finds the city man's table and a more wholesome, cleaner and better product carries the stamp of the inspector's approval.

The co-operative creamery is an old landmark in the more densely populated dairy countries. Wisconsin reports 1,009 local co-operative creameries with an average number of cows per creamery of 767 and an average membership of 83. In Belgium at the present time the membership of a co-operative dairy is 108 farmers and the average number of cows for each creamery is 260. In Germany the average number of members is only 97, but the number of cows is as great as in Belgium.

The co-operative creamery spirit has not flourished in the less developed dairy sections owing, sometimes, to the poor and injudicious management on the part of the stockholders. In many instances co-operation failed to pay the expected percentages and the scheme failed. However, this poor management and loss may be eliminated and satisfactory results obtained by first appointing a man as president who is thoroughly acquainted with the dairy business. He will endeavor to interest the men in the community to buy stock upon which the company agrees to pay a fixed per cent. of interest besides assuring a stated price for the butter-fat, equal or greater than he may secure otherwise. The required stock is obtained; the contract let and the creamery opens. Money should not prevent the company from securing a thoroughly reliable and able man to manage the creamery. The management having done their part it is up to the members to do two things: deliver their milk or butter-fat at a certain time in the day, and guarantee that the product shall be free from any contamination. Should this rule in any way fail, it is readily seen that a man who contributes a gallon of contaminated butter-fat will lower the quality of many pounds of butter. The advantages to the patron are that he is able to feed the skim-milk to his pigs and calves in a sweet condition and he has the opportunity of securing the buttermilk at a reasonable price and can always depend upon getting a reasonable and satisfactory price for his products.

The co-operative spirit has no less influence upon bettering the social conditions of the community. Organizations and clubs are the results of improved methods in dairying and general agriculture. The milkers' club is organized and has for its purpose the discussion and ultimate betterment of the milkers' situation. Milking loses its drudgery and becomes an art and accomplishment when mixed with thought. The impetus for doing better and more efficient work is stimulated among the milkers by the employer offering a prize to the milker whose cows return the highest production per month.—Kimball's Dairy Farmer.

Weeds Must Go.

The clean meadow produces 47 per cent. more than the weedy meadow. The clean potato fields 49 per cent. more than the weedy fields. The clean oat fields 33 per cent. more than the weedy fields. In these statements, we have the reason for the eradication of weeds on the farm.

There are large areas of land so situated that fields cannot economically be cleaned by cultivation and it is necessary to use other means for destroying the weeds.

Many years ago in Germany a method was developed for the destruction of wild mustard and radish in localities in which the social and economic condition made the mechanical method of cleaning the fields impossible. This method followed the discovery made in France that a solution of Iron Sulphate applied in the form of a spray to wild mustard, killed the plants, furthermore that the mustard plants in a grain field can be destroyed and this without injury of a permanent nature to the grain crop. As this way of killing weeds spread over the country, the problem soon became one of applying the solution.

It was soon discovered that there was no question about the destruction of wild mustard by this method, but the trouble would be in securing high-grade, home-made spraying machines for the application of the solution.

The success or failure in spraying grain crops to kill weeds, depends on how the Sulphate of Iron is applied and when. For instance, if the solution is applied in drops, as from a watering-pot, the weeds will shed the drops without any damage being effected. Large drops strike the leaves and roll off; small drops run together and form large drops, but a mist from a good sprayer settles down upon and completely covers the leaves.

WHEN TO SPRAY.

Spray on a bright, warm day, or on a dark, damp day; it does not matter so long as rain does not come within 18 to 20 hours. Spraying on dark, damp days gives quickest and surest results. Spraying on bright, warm days must be followed by the dew the next morning to be effective.

The white coating or spots seen on leaves sprayed on dry, warm days, is the dried-out Sulphate of Iron; the dew dissolves this so that it acts on the leaves.

SIZE OF THE WEEDS.

It was formerly thought that the best time to spray was when the mustard plants were in the third or fourth leaf; now we know that the best time is when the first buds appear on the majority of the plants, for then only is practically all the mustard seed in the soil germinated.

HOW MUCH SOLUTION TO APPLY.

To do the best work, apply 52 gallons solution to the acre.

HOW TO MAKE THE SOLUTION.

To make the spraying solution, empty a 100-lb. sack of Sulphate of Iron into kerosene, spirit or vinegar barrel, fill with water and stir with a hoe a few minutes until dissolved. Strain through several thicknesses of cheesecloth over the manhole of the spraying machine.

HOW TO APPLY.

The solution must be applied with a powerful spraying machine, producing a real mist, free from drops. The pressure is 80 to 100 pounds, measured at the nozzle, not at the pump—at 100 lb. pressure the mist is driven all to the plants and rolled and rolls over and over, wetting the underside of the leaves as well as the upper side.

Driving over the grain that is from four to six inches high, will in no-wise injure it in two weeks it will recover. Be sure that each strip sprayed laps over the last one sprayed. Have the boom high enough so that the point at which the spray fans meet is above the highest plant. Keep raising the pressure when you spray until you secure a perfect mist, then lock the pressure regulating valve. Do not go any higher but maintain this pressure.

ACREAGE SPRAYED IN TEN HOURS.

Depending on the facilities for preparation and handling the 20 per cent. solution of Sulphate of Iron used for killing weeds, a two-horse spraying machine will spray from 20 to 40 acres of grain in a ten-hour day.

Best Way to Use Poultry Manure.

Poultry droppings are the richest of all barnyard manures, because that part of the excrement which corresponds to the urine of animals is included in a semisolid state. The proportion of nitrogen is especially large and that of phosphoric acid comes next. There is a deficiency of potash, but even so, the percentage is larger than in the manure of most farm animals.

As ordinarily fed, farm poultry receive a ration which tends to make the manure rich in fertilizing value, and the birds being full fed, the amount is relatively large. Certain Belgian experiments would indicate that each fowl makes about 12 pounds manure a year, but Prof. Brooks, after experimenting in a small way at Amherst, Mass, considers this figure too low. Anyway, the value of the manure made by each hen is probably between 8 and 15 cents a year. Ducks and geese yield a larger amount than hens.

The nitrogen in poultry manure escapes easily, so that the droppings must be handled intelligently or much of their value will be lost. When scraped from the dropping boards the manure should be placed in bins, barrels or boxes or piled under cover. Then it may be sprinkled with earth, land plaster or kainit. The first named will help to save the nitrogen, but land plaster is better. Enough should be used to whiten the pile of manure. Kainit has the advantage of adding potash, but tends to prevent the manure from drying. Fine earth added at the same time will help to dry it.

DO NOT USE ALONE.

Being a quick acting manure, poultry droppings can be used to best advantage in the garden and probably with best results just before the seeds are planted. It ought not to be used clear, for then there is great danger of burning the plants. Even when mixed with earth or plaster, it ought to be spread very thin, and lightly but thoroughly harrowed or raked into the ground. Perhaps the best plan is to use the manure in the hill or drill, mixing it well with the earth. It should be fine and only a little used.

Not being a complete fertilizer, it may be balanced by the addition of muriate of potash and acid phosphate.

HORTICULTURE.

Buying Inferior Trees a Great Mistake.

Many years of observation and experience in commercial orcharding in three states have convinced the writer that buying poor trees is one of the greatest and commonest of mistakes. The nurserymen are not to blame for selling inferior goods; because the planters demand them it is [illegible] business to supply the demand. How men can be so short-sighted is to me a constant source of wonder and amazement. The best trees cost only a few cents each more than the poorest ones, yet when full grown they are worth several dollars more. It is simply a question of losing dollars to save cents—a good illustration of the folly of being penny wise and pound foolish. Some men are said to be so short-sighted they cannot see a dollar if there is a nickel lying in front of it. Lots of these men are in the orcharding business. They reason that a penny saved is a penny earned, and the sight of present gain, however small, blinds them to future profits, however large.

DEMAND DETERMINES QUALITY.

These are strong statements, but the situation demands them. Go to the average nursery and observe the methods used to meet the demand for cheap trees. Cions cut from any old trees, or even from nursery stock; careless grafting on small piece roots, trees badly dried out after being dug, many roots broken and otherwise injured in digging and packing, yearling trees—mere whips—sent out to keep down the freight bills and get quick returns; runty, ill-shaped trees consigned to retail dealers when they should have been consigned to the brush heap—and yet we wonder why such a small percentage of trees planted live and bear fruit. Nurserymen give value received; their profits are not large. When growers demand better trees and are willing to pay for them the nurserymen will gladly furnish the goods.

The first great need for improvement is in the selection of cions. It is not enough that cions should be cut from bearing trees, although this should always be insisted upon, but only the best specimens should be selected for propogation purposes. The live stock grower looks carefully into the pedigree af his animals, why shouldn't the orchardist be equally particular about the ancestry of his trees? We know there is a vast difference in individual fruit trees, just as there is in the genus homo, and the progeny of runty, scrubby trees is no more desirable than the offspring of unhealthy, incompetent men and women. Give us nursery stock propogated from mature, thrifty trees; heavy, regular bearers of first-class fruit. For this class of goods planters should be willing to pay a handsome premium over ordinary stock.

WHAT TREE AGENTS TALK.

Some tree agents talk a great deal about the superiority of whole-root over piece-root trees. As a matter of fact, all grafted apple trees belong to the latter class, since the entire root of a seedling is never used in grafting. It is simply a question as to the size of the piece used. Some prefer one straight root and others a branched stock for grafting. Those who use small pieces of roots for grafting contend that this permits the use of a long cion, which extends deep down into the ground and soon throws out roots of its own, so that the tree is soon supported by its own roots. The alleged advantage lies in the fact that the cion is generally from hardier stock than the seedling. However that may be, a good-sized root is necessary to grow large trees and small, piece-root grafts should never be used to cheapen the cost of production.

The way trees are permitted to dry out in transplanting is a fruitful source of failure in starting an orchard. The writer has seen trees dug and allowed to lie uncovered all day in the sun and wind and then loaded onto wagons like brush and hauled for miles with unprotected roots. A great many trees are stored all winter in cellars with no covering whatever over the roots. The planter may give trees the best of care after being received by him, but after having been dried out as above described there is little life or vitality left in them, and the wonder is not that so many die, but that so many live. The price of trees should be high enough so the nurserymen can afford to protect the roots from the time they are dug until delivered to the planter.

In some localities there is danger of the roots being partly killed by freezing if the trees are left all winter in the nursery row. This injury is sometimes not apparent when the trees are dug early in the spring and shipped at once, but is noticeable later when they black-heart, or rot in the center. This is one reason why some nurserymen dig trees in the fall and store in cellars over winter. If, however, the ground around the trees is well mulched there is little danger of winter-killing.

Fruit trees are often graded and sold according to length and diameter; this makes it impossible for the buyer to determine whether he is getting a thrifty 2-year-old or a runty 3-year-old—a very important matter. Buyers should insist upon the age as well as the size of trees being given. Trees that are small for their age, as well as ill-shaped specimens, are dear at any price and should never be planted. Many buyers do not understand this point, judging a tree entirely by its size.

RIGHT AGE TO TRANSPLANT.

The right age at which a tree should be transplanted is a question upon which there is a wide difference of opinion. The strongest argument in favor of yearlings is the one which should carry the least weight, namely, cheapness. Where is the economy in saving $5 per acre in buying yearling trees and then cultivating the orchard a o
orchard a year longer before it comes into bearing? Not only is one year's work saved by buying 2-year-old trees, but one crop is gained. To say that the yearlings will catch up with the 2-year-olds is unreasonable and disproved by experience. The theory that the former stand the shock of transplanting better than the latter is not borne out by experience. As a general proposition young trees stand transplanting better than old ones, but the difference is not noticeable until the trees are at least 3 years old. Here in the Pacific coast country yearlings are planted almost exclusively. Most of such trees make little or no growth the first year, which is certainly no better than 2-year-olds. The latter are the kind planted over most of the country, showing that they are preferred by a majority of planters. There is no reason why younger trees should be planted here than elsewhere—there is certainly no place where trees are more easily transplanted than in this moist Puget Sound section. It is true that buying yearlings enables the orchardist to shape the top to suit himself, but it is easy to buy suitably headed trees, or to have them pruned to order.

"The best is none too good" should be the motto of the orchardist in buying trees. A few dollars difference in the price of several hundred trees is a mighty small thing compared to the superior value of an orchard grown from the very best nursery stock obtainable.—O. H. Barnhill, in Twentieth Century Farmer.

Heading Apple Trees Too Low.

There is seldom the necessary distinction made between a low-headed and a short-bodied tree; or between one that is high-headed and one that is long-bodied. It is becoming more and more customary to head them at a height of 2 feet or less from the ground. Now heading low does not produce a low-headed tree, and it is questionable if it is the best policy. The idea is that the trunk acts as a storehouse for the accumulated sap which is to be used in making the growth of, at least, the earlier part of the following year. If we eliminate the trunk by heading low, we destroy the storehouse and thus impair the vitality of the tree. This forces the tree to develop fruit spurs and fruit buds and thus early bearing is induced. But owing to its lessened vitality it will die of old age while a long-bodied tree is still in its prime.

If a tree be headed 5 feet from the ground and the top kept rather thick for a few years the tree will throw out a strong and nearly horizontal framework. The trunk will be large enough to amply support it and its height will permit the development of numerous low secondary branches. These may be headed back and trained to any desired height. Hence we may have a broad, low-headed, dome-shaped tree with a trunk large enough and high enough to support it. At 40 years of age such a tree should be in its prime and capable of carrying eight to 10 barrels apples. This is the ideal form for a big, old tree and resembles the type of tree grown in western New York, where immense yields of single trees are reported.

UPWARD GROWTH UNSATISFACTORY.

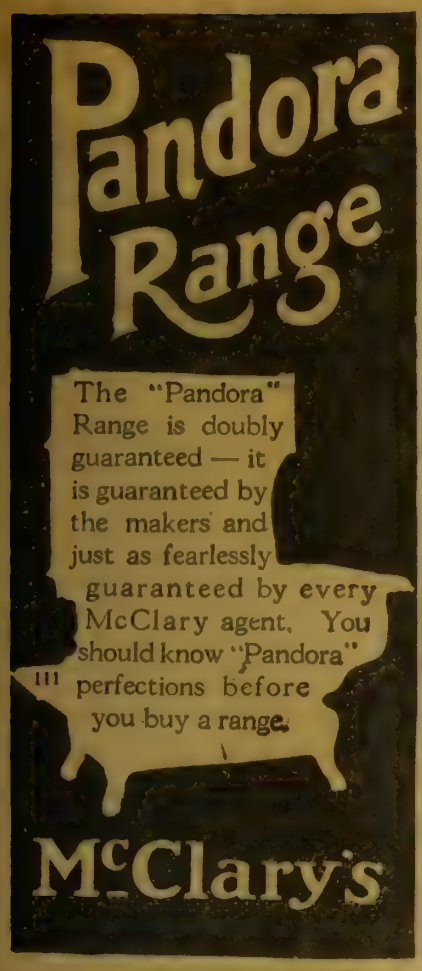
If a tree is headed 2 feet or less from the ground, the tendency of the framework will be to assume an upright position. There will not be sufficient vitality in the trunk, or light and air circulation below to enable the framework to extend horizontally, and for the same reasons the lower limbs will be unproductive. If left to itself such a tree will form a high-headed tree with two or more long unproductive trunks. Under careful pruning it will assume a vase form with a small head capable of carrying two or three barrels apples. Still from its small size four times as many trees may be grown on an acre as of the large dome-shaped type of western New York. So the difference in yield per acre is not material. This is the favorite type in the Ozarks, where immense returns per acre are reported. This, too, is the type that is becoming common in newly planted orchards over nearly the whole of New England.

On the Pacific slope where perfection of form, high color and size of individual apples rank above the yield, we find the same type with the exception that the trees are planted fully as far apart as the giants of western New York, and the tops severely thinned and the remaining branches cut back to about one-third of the annual terminal growth. In southern Ohio, and especially in Kentucky, we find orchards more than 100 years old, with scarcely a missing tree. These were trimmed to a height of 6 or 8 and often 10 feet and then allowed to grow at random. In the Piedmont mountains, the most common type is that of a tree with branches to the ground like a Christmas tree, and growing to a single trunk until it reaches the required height and then the top is cut off and the tree is kept from growing any higher.

There are perhaps a dozen other types each common in some locality and each profitable and the question is: Which type is the more profitable and which is the better for a man to adopt. No one knows. There are no data upon which to form an opinion. The question cannot be decided by any argument. Necessary experiments would need to be extensive and to extend over a period of more than a century. So a man should choose the type that best pleases him and plant and prune and grow to that type and none other. Never attempt to change to a different type. It is true that this change may be and often is made, but it requires the knowledge and experience of an expert and his almost constant attention for several years. It is seldom, if ever, as profitable or as satisfactory as it would have been had the trees been pulled out by the roots and new trees planted. Another factor is the variety. If one wished to grow an orchard of the New York type it would be foolish of him to plant trees of the Wealthy type; and equally so to plant Roxbury Russetts if he wished to grow 100 trees per acre.—C. H. Ormsbee in N. E. H.

Details of Strawberry Success.

Probably the most popular small fruit is the strawberry. Relative to its successful culture E. H. Hallet, lecturer of the Vermont state grange, recently gave his experience at the



Pandora Range
The "Pandora" Range is doubly guaranteed — it is guaranteed by the makers and just as fearlessly guaranteed by every McClary agent. You should know "Pandora" perfections before you buy a range.

600 Apple Trees
1000 bbls. a Year

96 Acres; 1-4 mile to P. O.; near neighbors, schools, churches and depot; everything is here to make farming an ideal occupation; borders salt water; splendid 2 story, 12 room house; 2 barns, one 40x60; 600 apple trees; picking 1000 bbls. in season, cuts 75 tons hay; abundant supply wood and timber; accident to aged owner induces him to throw in horse, cows, pigs, and farm machinery, if taken immediately the low price for this valuable farm is only $7800, part cash; for traveling instructions to see this and a 228 acre Annapolis Valley fruit farm for only $1900, write THE MARITIME FARMER, St. John, N. B.

Hay Higher

W. J. PHELPS
Chamber of Commerce, Boston, Mass.
Reference: BEACON TRUST CO.

Prolific stock for breeding should be chosen wherever possible. A mare or cow that has reproduced annually for fifteen years or more is sure to leave this valuable quality with some of her offspring. The same is true of a stallion, a bull, a boar or a ram. If they are sure breeders they are of considerable value even if they do not possess all the fine points looked for in show ring animals. The first function of an animal is reproduction. After that it is up to the breeder to mate so as to bring this to the end desired.

Vermont farmers' week. Mr. Hallett says soil and location are first considerations. Land that has carried the previous year some hoed crop is preferred. Strawberries should not be set on sod land because of the white grub. Slope is quite important, a southeast cant being preferable to any other, thus avoiding about two hours of the forenoon sun. An application of twenty loads stable manure per acre is sufficient and land should be well plowed, thoroughly harrowed and fined until all lumps are destroyed.

Buy only the best plants and green or light colored roots. Those with old black roots should be discarded. Buy in your own vicinity, taking varieties that have given satisfaction in the neighborhood. Plants should be cut back at least a third thus favoring the formation of feeding roots.

Make rows 3 feet 4 inches apart and set plants 15 to 20 inches distant. It is well to start cultivation immediately after setting. Hoeing should be frequent. Pick off all fruit blossoms the first season. Do not allow the matted row to form more than two feet wide. Keep weeds out until freezing time. Mr. Hallett believes in mulching during the winter after a depth of 6 or 8 inches of snow has fallen. This is done for two reasons: First, to hold the berries back until the southern berries have left the market; and second, to avoid the late May and June frosts. The only spring tillage consists af raking the straw from the first and second row, running the cultivator lightly through, then drawing the straw from the next row on to the surface, cultivate, and so on until the piece is completed. Then the field should remain untouched until the picking.

Grade the berries preferably in the field instead of the packing grounds. No 1 berries should be of a good fine quality and baskets should be filled rounding full. Baskets with closed corners are preferred, as they are stiffer and berries will not work against each other and cause them to decay. After the picking season the ground should be plowed rather than allowed to raise a second crop.

The Charm of a Flower.

Saadi, the old Persian poet, said: "If thou hast two loaves sell one and with it buy a rose, for the bread is but food for the body, whereas the rose is food for the soul."

The one thing that brightens the farm home and its surroundings is culture, love of beauty and refinement evidenced in flower and tree around the farm house. Flowers are easily grown in a variety that is wonderful to the person who has never noticed them. A farm with no vines, no trees, no flowers is a sad place indeed. It looks as though the owners in their rush for financial returns begrudged the time, the soil and even the sunlight to any growing thing that could repay in beauty alone.

A half hour spent in a pretty garden by a tired housewife will cause her to forget her toil, fill her soul with pleasant thoughts and give her such a buoyant spirit that the whole tenor of the day's work and routine is changed. It is as if a ray of sunshine had fallen over the place and like millers to the lamplight, friends enjoy her radiance.

To provide such a recruiting ground for the farm family is, therefore, the best kind of common sense. April is the month to begin operations. No man is so poor who cannot support a rose, a row of hollyhocks and a bunch of sweet peas or a bed of ferns. A bed of asters whose plain green stems struggle through the summer, bursts suddenly into bloom in the fall and turn the common place into a perfect paradise. Any flower is a good companion and may give thoughts that sometimes the preacher fails to suggest.—Farmers' Magazine.

An I H C Manure Spreader a Necessity on Every Farm

If you expect to continue farming and raise a paying crop every good year, you must arrange to return to the soil the plant food taken from it by growing crops. Neglect to do this will reduce the productivity of your farm, and, in the end, to ruin it. When a farm is once run down it takes years of slow, careful upbuilding to bring it back to its original fertility.

If you attempt to fertilize by spreading manure with a fork, you fertilize unevenly and waste fully half the manure. When you use an I H C manure spreader properly, the fertility of your soil remains at a constant standard, while its physical condition improves from year to year, assuring bumper crops in good years, and the best possible stand when weather conditions are unfavorable.

I H C Manure Spreaders Corn King and Cloverleaf

will spread manure as it should be spread; in an even coat all over the field, light or heavy as may be needed, and pulverized so that the plant food elements in it combine with the soil.

An I H C spreader has many mechanical advantages. The apron moves on steel rollers running on steel tracks. This construction reduces draft and prevents the apron from slipping under the load. The apron feed mechanism and beater gears are provided with shields which protect them from sleet, snow, and manure A strong, durable feed moves the apron steadily toward the beater at any desired rate of speed. This steady movement insures even manure spreading whether the spreader is going up hill or down

Compare the I H C apron feed mechanism with that of any other manure spreader and see how much stronger and more positive it is. I H C spreaders are so constructed in every detail that they do their work positively, with the least effort on the part of driver or horses.

I H C spreaders are made in different styles and sizes, for use in orchards, vineyards and gardens, on small and large farms. The I H C local agent will show you the machine best adapted to your needs. See him for catalogues and full information, or, write nearest branch house

RU-BER-OID Roofing

TRADE MARK REGISTERED.

In Red, Brown and Green

(Canadian Patents 93,027 and 93,160

RU-BER-OID is the only ready roofing made in **permanent,** impregnated colors. The colors are not painted on, but by our patented process are incorporated in the RU-BER-OID gum with which the roofing fabric is coated.

As a result the color cannot peel or wash off—it stays as long as the roofing lasts.

If you want a roof that is handsome, easy to lay, weather-proof, fire-resisting, moderate in price, and that will give you fullest satisfaction and service, use RU-BER-OID in colors.

Any RU-BER-OID Dealer will gladly give you samples, or we'll mail them to you on request, with our Booklet, "RU-BER-OID—Why?"

DAIRYING.

Cheddar Cheesemaking.

Commercial Starter.—A good starter is the foundation of cheesemaking, as it is composed almost entirely of lactic acid bacteria; and, in adding it to the milk, millions of desirable germs are introduced and help to crowd out the undesirable ones. Use from ½ to 1½ per cent. according to the sweetness of the milk.

Above all, never use whey for a starter. Sour whey always contains undesirable germs, and these will be transmitted from one day's milk to the next.

Heating the Milk.—The temperature of the whole milk should be raised to 84 deg. or 88 deg., according to its richness. In spring, a lower setting temperature and a comparatively larger quantity of rennet should be used. As the season advances, and the milk gets richer, the setting temperature should be raised.

Testing Acidity of Milk.—The milk is now tested with the acidimeter test to ascertain its acidity. The acidities which give the best results are .22, .225, and .23, depending on the condition of the milk and the amount of starter used.

Coloring.—The coloring depends on the strength used; from 1 oz. to 1½ oz. to 1,000 lbs. of milk gives the right color. It should be mixed in half a gallon cold clean water, and gently stirred into the milk.

Rennet Test.—Before setting the milk, a rennet test should be made. From 18 to 20 seconds is the proper time for normal working milk. The time will vary with the seasons, condition of milk, and strength of rennet The quantity of rennet used is from 3 ozs. to 4 ozs. per 1,000 lbs of milk, and it must be diluted with half a bucket of cold clean water to each vat before pouring into the whole vat of milk. The water delays the action of the rennet for a few seconds.

The rennet should be stirred into the milk with the curd rake or agitator for 2 to 3 minutes at a fairly fast rate; then slow down for 2 minutes so as to have the milk perfectly still before coagulation takes place. Withdraw the rakes or blades of the agitator and skim off any dust or fat that may have accumulated on top of the milk. Put canvas cover over the top of the vat to keep the temperature from falling.

Coagulation.—Watch for the coagulation of the milk. If this occurs within 10 minutes, the curd should be ready to cut in 35 minutes from the time the rennet was added to the vat; or the time it takes to thicken by 2½ from the time it thickens, i.e., 10 by 2½ equals 25 plus 10 equals 35 min. from the time rennet was added.

Cutting the curd.—To ascertain when the curd is ready to cut, wet the forefinger and insert it carefully into the curd and then raise. If the curd breaks cleanly and shows clean whey it is ready for the knife.

The horizontal knife should be used first, lengthwise on the vat. The curd then keeps in place better and allows a more uniform cut to be made with the perpendicular knife. The latter is used crosswise and once lengthwise. The cubes should be even and not over ⅝ in.in size.

The curd should be stirred gently by hand for 10 minutes and the curd adhering to the sides or bottom of the vat taken off before applying the curd rake or blade of agitator.

Testing Acidity of Whey.—A test of the whey should be taken before turning on the steam so as to know how the acid is working. With some milks and some starters showing a test of 0.14 per cent., three-quarters of an hour from rennetting will bring the curd on quite fast enough, while others even at 0.15 or 0.16 per cent., may work too slowly in the same time.

Heating the Curd.—Steam should be applied through the medium of water under the v at, as there is less danger of scorching the curd. Turn the steam on slowly at first and gradually apply faster as the curd gets firmer. Stir constantly during the heating process, wnich should take from 40 to 45 minutes to raise the temperature to98 or 100 degs. as the case may be.

After the curd is at the desired temperature, it should be stirred occasionally to keep it from matting and to insure even and thorough cooking.

Testing Acidity of Curd.—If the whey is showing 0.175 in two hours from setting in the milk, remove the whey until the top of the milk curd may be seen; this checks the acidity from getting too far ahead. Mix the curd up by hand so as to get it nice, firm, springy, and elastic, so that when a handful is squeezed together it will fall apart readily on relaxing the pressure, before running the whey off.

If the curd is well cooked, allow from 0.195 to 0.22 per cent. of acid before throwing the curd up on the racks in the vat.

Well cooked curd requires very little stirring as the whey leaves it freely. It is of the greatest importance that the curd be cooked firmly, and that it contains sufficient acid before the whey is run off.

Racking Curd.—The racks are made in 2 feet sections, from 4 to 6 ins. in depth, to fit inside the vats. Tilt the vat so that the top end is about 6 inches higher than the bottom, and draw curd downwards. Put in the first section of rack and cover over with rack cloth. Dip enough curd on to the rack to make space for second rack. This process is continued till all the racks are in place.

Stir curd gently and level it back 8 to 10 inches deep to mat. Test the acidity of the whey after racking; it should show from 0.258 to 0.30 per cent. in 2½ to 3 hours from setting the milk.

Matting the Curd.—Put cover over the top of the curd and allow it to mat from 10 to 15 minutes; then cut in strips lengthwise and crosswise in 8 to 10 in. blocks and turn over. Repeat the process until the curd becomes "meaty," and when pulled apart it splits instead of breaks. At the last turn, place the curd on the bottom of the vat and remove cloths and racks before milling, which generally takes two hours from racking. The temperature of curd at this stage should be 94 degs.

Milling Curd.—Knife mills should be used, giving a clean cut ⅜-in. to ½-in. in size. If smaller, they injure the curd, causing unnecessary loss of butter fat and spoiling the texture of the cheese.

Mellowing the Curd.—After the milling is completed, the curd should be turned over by hand, and covered to maintain the heat and prevent the curd from bleaching. Repeat the same process every 15 minutes for one hour after milling.

Testing Acidity of Curd.—Fifty minutes from milling make a small hole in the center of the curd, so that the moisture will gather sufficiently to allow a test to be made. Aim at 1 per cent. of acidity, three hours after the curds are dry on the racks.

Turn the curd over by hand and cover up, repeating the previous process of mellowing. In half an hour the curd becomes soft and velvety and exudes a moisture of half fat and whey testing 1.05 to 1.10 acidity. The curd is then ready to salt.

Salting the Curd.—The amount of salt to be added depends upon the moisture in the curd and upon the length of time for ripening. Moist curd requires more salt than quickly ripening cheese. The rate varies from 2½ to 3 lbs. per 1,000 lbs. of milk.

If the temperature of the curd is 88 degs. let the water run from under the vat. The curd should be turned over and spread evenly over the bottom of the vat. Sieve half the salt on the curd and stir up thoroughly and evenly through the mass. The remainder should be put on and also well mixed.

Piling the Curd.—Pile the curd up in the centre of the vat so as to allow the whey to escape. The temperature of the curd at this stage should not exceed 84 degs. Cover the curd over for 20 minutes until the harsh feeling caused by the salt has disappeared; mix the curd up by hand and it will then be ready for the hoops.

Dressing Cheese Hoops.—In the bottom of the hoop place a clean cap cloth (hessian preferred). Use two cloths (seamless bandage). Wet the first cloth before putting it on, and do not have any on the bottom. Put the other cloth on and lap about 1-in. on the bottom of the hoop and cap cloth. When two cloths are used a silky skin is put on the cheese. The outside cloth is taken off in the morning and washed ready for the day's hoops.

Hooping the Curd.—The curd is now firmly packed into the hoops and weighed, and put into the press with the jointing of the inner hoops facing the gutter of the press.

Pressing the Cheese.—At first, the pressure should be applied gradually to the curd. When the whey starts to come away freely, stop screwing for 10 or 15 minutes; then screw up, repeating this process for one hour. A quarter of an hour before dressing the cheese, pour three or four buckets of water gently over the hoops at a temperature of 180 deg., to assist in putting a good rind on it.

Dressing Cheese.—After about one hour has elapsed the cheese should be removed from the press, and the operation known as dressing the cheese performed. This consists of trimming round the edge of the cheese, wetting the cap cloth with clean hot water, and pulling up the bandage and removing wrinkles so that the binding will lap ¼-in. over the end. Wet the outer cap cloth and replace the cheese in the press, joining the inner hoops on the top. Pour three or four buckets of hot water on top of the hoops and gradually screw up fairly tightly. The maximum pressure is not put on until late at night.

The cheese should be turned in the hoops, end for end, and the outer bandage taken off in the morning, and any defects in appearance remedied. They are again returned to the press and allowed to remain in the hoops until they are required for the day's cheese. The outside bandage should be washed in hot water and spread over the top of the hoops to air and dry, so as to be ready for use when required.

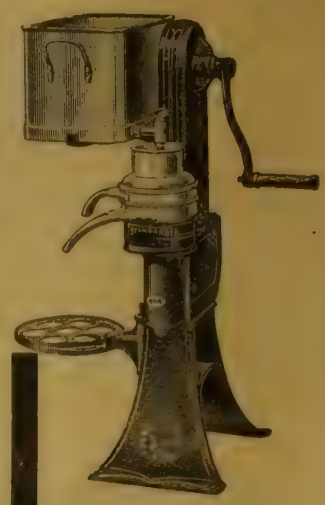
After being taken from the press, the cheeses are removed to the maturing to ripen.

Maturing.—The cheese should be turned every morning on the shelves in the maturing room, which should be well ventilated. The cheese shelves should be kept scrupulously clean and thoroughly washed at the end of the season with boiling water and washing soda. This keeps the cheese clean and helps to prevent mould. The floor also should be scrubbed and kept clean. Clean and neat cheeses placed evenly on the shelves give the room a nice appearance.

Hoops and presses should be washed thoroughly once a week, and cap cloths should be kept clean and sweet. The cheese vats, curd racks, curd cloths, etc., need special care in washing in order to keep them in first class condition. Curd racks should be left outside and well aired.

Keep the temperature down as much

Gains More $ $ For You Because Skims Closer



The difference in using a separator that skims to .10 per cent. and the

Standard

cream separator which skims to .01 per cent. amounts to $27 in one year with a herd of 20 cows. In other words the Standard cream separator gains 27 more dollars for you than the other machine, because the Standard skims that much closer. The amount of this gain is not guessed at by us. We have the figures to show you, the correctness of which are certified by one of Canada's leading dairy experts. The difference between .10 per cent. and .01 per cent. looks small on paper but it amounts to a big fistful of dollars at the end of a year. Very few makes of separators skim to .01 per cent. even under the most favorable conditions, whereas the Standard Cream Separator has averaged .01 per cent. tested under various conditions. In fact, adverse conditions have been found to affect the Standard very little. Its records at dairy schools and agricultural colleges show that it is indeed a remarkable separator. You may have to pay a little more for the Standard than for other machines but the Standard soon makes up the difference by the extra dollars it gains for you by its closer skimming.

FREE BOOKLET Write for it. It shows tests of the Standard under various conditions and gives the figures referred to above proving the Standard's gain over others to be $27.00 per year. Also get catalog explaining construction of the Standard in detail.

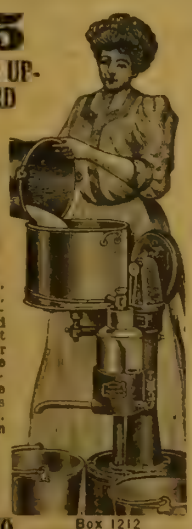
15 95 AND UPWARD



AMERICAN SEPARATOR

THIS OFFER IS NO CATCH. It is a solid proposition to send, on trial, fully guaranteed, a new, well made, easy running separator for $15.95. Skims hot or cold milk, making heavy or light cream. Designed especially for small dairies, hotels and private families. Different from this picture, which illustrates our large capacity machines. The bowl is a sanitary marvel, easily cleaned. Shipments made promptly from **WINNIPEG, MAN., TORONTO, ONT., and ST. JOHN, N. B.** Whether your dairy is large or small, write us and obtain our handsome free catalog. Address:

AMERICAN SEPARATOR CO. Box 1212 BAINBRIDGE, N.Y.

When writing advertisers please mention the Farmer.

as possible during spells of hot weather, as over-heated cheese loses flavor, discolors, and becomes bitter.

If the acidity is allowed to overdevelop while the curd is in a soft condition, a more or less sour cheese will be the result. It is not the amount of acid in the curd at the time the whey is run off that indicates whether a cheese will be sour or not, but rather the condition of the curd as regards firmness when the acid develops.

Openess in the cheese is due to not allowing the curd to mellow down sufficiently before adding the salt and putting into press too soon. A sweet cheese is always open, because it resists the pressure and puffs and swells after removal from the press.

Mottled Coloring.—An uneven development of acid and moisture in the curd. This can be avoided by uniform cutting, heating and stirring, using ⅜ horizontal knife lengthwise of the vat and then cutting with the ⅜ perpendicular knife crosswise of the vat and lengthwise. Mix the curd up by hand and then give it an extra cut lengthwise of the vat, giving a smaller cut which makes it much easier to get the curd firmed.

Starters should always be strained through a layer of cheese cloth and added to the vat of milk before coloring.

The curd left over from the previous day should be placed in the corner of the vat after the day's curd has been piled up on the racks. The drippings from the curd will warm it up. Drain off the curd before milling, pull the curd into a heap, and salt apart. When hooping the fresh curd, put the stale in the bottom of a hoop.

The chief advantage of matting the curd is to improve the texture and body of the cheese. The curd must be turned frequently on the racks in order to prevent the whey forming in pools on the curd.

The effects of salt on the curd are to expel the moisture; to improve flavor, body and texture of the cheese; to retard ripening or curing; and to add keeping quality to the cheese. If salt be applied to the cheese before it becomes velvety, the the quality of the cheese is not so good.

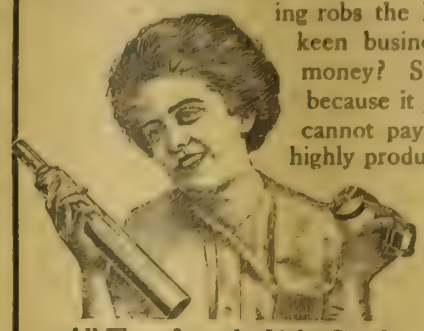
A realy fine Cheddar cheese should have a clear pure silky and firm appearance when drawn by the trier. There should be no stickiness or pastiness on touching it; neither should there be any holes in the meat, or streakiness in the color. It should be pleasant to the eye, and sweet to the nose and the palate.—Journal of Agriculture, Victoria, Australia.

Tin Cream Cans.

Prof. H. H. Dean recommends tin cream cans. As a result of several tests made with cans and crocks, covered and uncovered, cream cooled and uncooled before placing in the can or crock, all kept on a cement floor in a cellar, Prof. Dean says it was found at the Ontario Agricultural College that a bright, clean tin can is just as good for keeping cream in as a crock, and it is much lighter to handle and not so easily broken. A chipped or cracked crock is apt to cause bad flavours in the cream. Cream should be cooled before placing a lid over it. Where cream is added to the container daily, it ought always to be cooled before mixing with cream from previous separations. Undoubtedly the best place to hold cream is in a suitable box or barrel having cold water or ice and water surrounding the can of cream. This method causes much more rapid cooling of the cream than air cooling, which prevents fermentation and enables the farmer to deliver sweeter and better flavoured cream for butter-making.

WHERE MONEY IS MADE

Finest homes, biggest barns, heaviest crops are found on dairy farms. Dairy farming improves the land. Wheat or similar crops without dairying robs the land. Why not follow the lead of keen business farmers who are making most money? Such men use highly productive land because it pays them profits which inferior land cannot pay, and they use and recommend the highly productive



All There Is to the Light, Simple, Sanitary Dairy Tubular Bowl

SHARPLES Tubular Cream Separator

for similar good reasons. Tubulars have twice the skimming force of others, skim twice as clean, pay profits no other can pay.

The widely known T. Eaton Estate, here shown, near Georgetown, Ont., is but one instance out of many too numerous to mention. Dairy Tubulars are used both on this farm and at Mrs. Eaton's summer home.

No disks in dairy Tubulars. Easy to clean. Wear a lifetime. Guaranteed forever by the oldest separator concern on this continent. One-quarter to twice as much butter as setting milk in pans or cans. Tubulars produce enough more every year over next best separator to pay a big part of the price of the Tubular.

LIVE STOCK.

Docking and Castrating Lambs.

Out near the sheep pen a new fire was kindled. I was getting ready to dock my lambs, yet many farmers would only associate the idea of an early morning fire with branding cattle or killing hogs. I wanted a fire and some hot irons with which to sear the wounds. Some do not agree that docking is a good business proposition. At first it seems painful and so cruel, yet long ago farmers had to learn that some things look cruel which must be done. The good of the lambs and the farmer's pocketbook favor docking and castrating while the lambs are still young. A sheep's tail is a collector of filth and a nest for blow flies and maggots. Their presence is highly objectionable in the ewe flock also.

When the fire was hot and the three small iron rods had heated to a cherry-red color I was ready to start work. One assistant caught the lambs after they had been penned in a small place, while another held the lamb for me to do the "de-tailing." He held then with their backs against his chest and a front and hind leg in each hand. In this position the lamb was up at a convenient height, its feet were out of my way and all things arranged themselves conveniently. Taking a sharp knife in my right hand and the lamb's tail in my left, I severed it with one downward stroke. Then the blood began to spurt from the severed arteries in a surprising manner. On the inner side of the stub left was one large artery and on the outer side were two smaller ones. From these the blood spurted rapidly. To stop this bloodflow I took a red-hot iron from the coals and touched the throbbing arteries. This seared them and stopped the blood with but little pain to the lamb. It was only the work of a minute yet it stopped all the waste of blood that might have sapped the life.

I have at other times tried cutting the tails off with a block, mallet and a chisel, but besides taking more helpers such a practice requires more tools, and so I prefer docking the tails with a knife. Many times I have used different styles of docking pinchers. Some are heated cherry-red hot and pinched down on the tail that is being amputated. Their use, however, necessitates the use of an extra helper to hold the tail out straight and to hold the small board which was slipped over the tail to protect the lamb's body from the heat. For fast work there would also be needed more than one pair of pinchers.

It is very important to leave the skin longer than the bone in order that when the stub heals there will be no bone sticking out unprotected. To allow for this when using the pinchers one simply uses a snugly-fitting board. When using a mallet and block it is necessary to put the skin back before setting the chisel on the tail, and to leave plenty of skin when simply using a knife all that is necessary is to hold the tail down in a straight line with the backbone when cutting off the tail. This pushes the skin on the back somewhat, so that an end is left to slip over the bone after the stub starts to heal.

Castrating lambs is a more serious matter. Certain I am that the average sheep farmer can well afford to castrate or "trim" his ram lambs.

It is no more difficult to castrate a lamb than a pig or a calf. First wash the hands and knife clean, and if it is to be had wet the lamb's scrotum with disinfectant. Then cut off the lower end, pull out the testicles, and let the lamb go. Have your assistant catch the lambs and hold them so that you can keep your hands clean. In holding them he should hold their backs against his chest and hold a front and hind leg in each hand. This brings them up to a convenient height and is the most convenient position. Some who have trouble and lose lambs after castration often have trouble because they try to cut a lengthwise slit in the scrotum. When cutting this way they fail to cut to the end of the scrotum and so the wound does not drain and inflammation starts. Some of the first lambs I ever castrated gave me trouble, for I cut the scrotum and then the covering of the testicle, pulling the testicle out and leaving the covering inside to collect pus and inflammation. This was wrong, for I should have simply cut off the end of the scrotum and then pulled out the testicles with the covering and all the cord I could get. In following this practice now I seldom if ever have trouble. To keep the testicles from slipping back, I cut the scrotum rather short, thus pushing the testicles so far out that they seldom slip away.

For best results the lambs should be castrated at a few weeks of age. If this is impossible one should not delay the operation indefinitely, but castrate them even if they are two months old. If they have grown to nearly marketable age before time is taken to castrate them, it would be better not to do it, but although the lambs may have become too old to dock and castrate this time, no farmer ought to be so old that he will not change his ways and dock and

"My Roofs 'Make Good' for 100 Years. I Want to Tell You Why."

"My New Metal Has Made Me a Proud Man. It Permits a 100-Year Roof at Low Cost."

"Sir, I tell you, I am a proud man. I have at last got the best roof ever made at a low price. My roof will last you for a whole century. You can put it on a wood framing. You can get it at about what you pay for wood roof. You can lay it. It will keep rain, lightning, fire, ice, snow and wind from harming your building. If you want a roof, I have the right roof."

"I Think Every Man Can See How a Roof Is the Big Point in a Barn."

"I worked 50 years to make a cleanly, strong, sure roof at a low cost. I had barns mostly in mind. When I started, bush fires were common. Cedar shingles went up like tinder from a single spark. Lightning burnt barns again and again. Leaky roofs rotted hay and produce by the ton—they let water rot the barn framework. Oshawa shingles stop this.

"Thus, I became one of the first metal shingle men in the world. I aimed to make a roof that would save twenty times its cost by saving a barn frame and foundation, as well as the stuff put into the barn, which represented thousands and thousands of dollars risked over a period of years under a poor roof."

"It Took Years for Me to Get the Design of My Metal Shingle Right."

"I thought it was easy. It was hard. It was a big contract. I didn't dream of what any roof has to stand. I thought about all a roof did was to let rain run off it, and keep in place the rest of the time. I found I had about twenty-five problems to answer at once in a single design.

"My roof had to have 'give' in it, so it would stretch in the hot sun and shrink in zero weather. It had to be ice proof, or lodged thaw-water would gouge seams apart. It had to be smooth, or lodged dirt would rust it. It had to cover its own nails, or the roof would leak. My roof had to be layable by anyone.

"My work was, I had to design a shingle that couldn't be laid face-down, or sideways, or upside down, or crooked, or be marred in the laying, or be smashed on the road between my factory and the place where the roof was. I found my shingle needed ventilating places in it that would let air out but wouldn't let water in. It had to be wind proof. Yes, sir, these things were all worked out by me in 50 years.

"I started to make a spark-proof and lightning-proof roof. I ended by getting one of the best roof shingle designs ever made. My roof has more experience and skill and years behind its design than any roof you can get in metal."

"I Had to Wait Fifty Years for My Last Big Point. This Was It."

"My business was world-wide by this time. My shingles were selling in Australia, Japan, South Africa. Governments specified them for roofs.

"All this time I was getting my design right little by little. But, do what I could, I had been troubled by the metal in it. It seemed impossible to get a metal which might not rust. I had to take the best metal I could get. I needed a strong, light, absolutely non-rusting metal. At last, I found a hint in Europe.

I followed up this metal. At last I devised a non-rusting 100-year metal, which was non-corrosive. The moment I put this metal into my shingle design, I got at one step a 100-year roof. This is the roof you can get from me at a low price."

"Why Do You Pay Me a Low Price? You Have My Big Sales to Help You."

"My metal shingle is not trash. You can get trashy stuff at a cheaper price. (It will cost you thousands of dollars in produce.) Yet you can buy my shingle at a low price. Its quality is kept high and its price is kept low by big, steady sales all over the world. If you do not look into my 100-year shingle, you are not treating your building right. Get a 100-year Oshawa roof for your building. It will save your building, and save you thousands of dollars in produce you worked hard to grow and harvest."

"Get My Book about This 100-Year Roof. It Has Building Hints for You FREE."

"I have helped you and all other builders with a roof I am proud of—a roof I know is right. I want to do more. I made my book 'ROOFING RIGHT' to tell about my roof. But I made it worth while for those who do not take my roof.

"It shows the best buildings in the country—the best barn arrangements. I will send you this book for a post-card, whether you take my roof or not. I want you to take my roof, if it stands your closest examination. Send for my book to-day.

castrate his lambs early the next spring. Docking and castrating mean dollars and cents.—J. C. Courter, in Breeders' Gazette.

Foot Rot in Sheep.

Foot rot is of two kinds, viz., contagious and non-contagious. The latter is a simple disease usually due to excessive wear of the hoof and the irritation caused by the introduction of dirt to the sensitive tissues of the foot. It is therefore, most prevalent on low, wet land and in filthy yards and barns.

Prevention is better than cure. Sheep should not be fed in wet, muddy or filthy places. Their hoofs should be examined and pared when necessary to remove superfluous horn. When the disease appears in a small flock the hoofs should be trimmed down closely and the feet washed or soaked in a solution of copper sulphate, 1 ounce to 2½ pints of water, then dress with watery solution of chloride of antimony, or preferably with a mixture of equal parts of chloride of antimony and tincture of myrrh. After such dressing the raw surfaces should be protected by a coating of pine tar or gutta percha varnish. Then remove the animals to a dry, clean pasture. If the disease is not of long standing this treatment will generally effect a cure, although in confirmed cases where much destruction of tissue has taken place it may be necessary to repeat the dressing several times.

For large flocks on the range or elsewhere a more general treatment is necessary. A suitable solution is made in the proportion of ten pounds of copper sulphate, dissolved in five gallons of water. Solution is put in troughs two or three inches deep. The sheep after being driven through water, preferably running water, to cleanse their feet, are, by using a narrow chute, made to pass one by one through the preparation. As an alternative to the above, affected sheep may be held for a short time on a floor sprinkled to a depth of three inches with freshly slaked lime.

Canadian sheep men may be thankful that the contagious form of foot rot is almost unknown in this country. The few cases seen are as a rule in recent importations. For this reason imported sheep and others that have travelled in dirty cars should be carefully examined on arrival and treated at the same time as they are dipped. Prevention of the trouble is much cheaper than effecting a cure. Treatment is similar to that described above, although owing to the persistent nature of the disease recovery is generally much more protracted. As in this form the trouble begins in the skin of the interdigital space and works downwards through the sensitive laminae, it is advisable to dress the skin between the dew-claws with a mixture of one part carbolic acid to ten parts of glycerine, or with vaseline twenty parts to one part of iodine. Dr. J. G. Rutherford.

In buying a breeding animal don't buy fat. With fat goes a low prolificacy. The rule is good in any class of animal, hogs, sheep, horses, cattle, chickens or dogs. A fat animal cannot be as vigorous as one in clean, thrifty condition. When the body is storing up fat it cannot be building another animal as is required by the laws of reproduction. This is the reason that steers gain flesh better than bulls or cows. The same applies to capons and barrows.

Every I H C Wagon is Inspected Four Times

HOW do you buy a wagon? Do you wait till you need one and then take the first that's offered you, or do you find out in advance which wagon will give you best service, and buy that one? Why not get as much as you can for your money? Buy the wagon that will stand up for the longest time and be easiest on your horses. That wagon is an I H C wagon. Here is why: Each I H C wagon is thoroughly inspected. I H C wagons—

Petrolia **Chatham**

have just one standard—the highest. The lumber used is selected from large purchases. Every stick of this lumber is carefully inspected. Another inspection is made when the parts are ready for assembling. This inspection assures perfect shaping and ironing.

The third inspection, when the wagon is ready for the paint shop, covers all the points of superior construction for which I H C wagons are famous. Bearings are tested, every bolt and rivet is gone over, the pitch and gather of the wheels are verified. When this inspection is finished, the wagon is up to standard everywhere, good enough to be stamped with the I H C trademark.

The final inspection is made when the wagon is ready for delivery. Four inspections to make sure that you get everything you pay for.

All these inspections are for your benefit, so that any farmer who owns one can say with truth, "My I H C wagon is perfectly satisfactory." The I H C local agent will show you the wagon best suited to your needs. He will supply you with literature, or, we will send it if you write. Address—

THE HORSE.

The Colt's First Year Most Important.

In handling a colt make him grow all he will the first year. This is when he should make his greatest growth, easiest growth and at the least cost. If you have a colt from a mare and a stallion that have the blood and weight and quality you have the material that should give you big horses when ready for the harness or the market at three or four years of age.

To start at the beginning, which is the proper place, naturally, don't allow the mare to do heavy work necessitating any excessive straining or jerking for a month previous to time to foal. Give her some alfalfa or clover in the ration. This will relax her. If neither of these hays can be had, feed some oil meal in the ration.

When the colt comes tie up or sear with a hot iron the navel and wash with some antiseptic solution daily for a week or ten days. The first nine days of a colt's life is the period when this fatal disease gets in its work through the navel cord. Many horsemen prefer to have the cord protected by a belt tied over the back of the little fellow in addition to the daily wash. The cleanest stables are none too clean to dodge the germ which causes navicular disease, or navel ill, as it is usually called, so that precautions as to frequent cleaning out of stables and changing of bedding can not be over done. Plenty of sunlight is a great aid.

In a few days the mare may be put to work, but it is a good plan not to work her hard for a time. Don't allow the colt to run with her in the field. He is sure to get in a wire fence or on a disc or mower sooner or later and may be the cause of a runaway. Have two mares foal about the same time if possible, and work one mare in the forenoon and the other in the afternoon shutting the colts in with the mare that is resting. The colts soon learn to suckle both mares and do not fret and worry. The mares should be milked out a bit to loosen the udders when working without the colts following.

When the mare comes in from the field don't allow her to have all the water she wants and don't let the colt rush to her side and take all the milk at once. Strip out a few streams from each teat and make him wait a few minutes until the mare has cooled somewhat. Otherwise bowel trouble will develop and many colts are lost through this disease.

Get the colts to eating grain as soon as possible. The earlier the better for both colt and mare. Give the colt a feed box from the beginning and put a handful of oats in it by the time he is two weeks old. In a few days he will be chewing these. Feed three times a day as much as he will clean up. It is a good plan to learn him to clean up his feed box, and he will never learn any younger. Feed oats and bran, half and half, by the time the colt is a month old, with a dash of oil meal once a day. Have some alfalfa or clover hay that was cut and cured early so as to get all the nutrients. The protein in these hays will make bone and muscle to put the flesh on for your ton horses.

By the time the colts are five or six months old they may be weaned without trouble. Three quarts of oats and two of bran with plenty of clover hay when in the barn and the run of a good pasture during the day is considered a fine ration by one prominent breeder.

Get the colts ready for winter with a thick coat of baby flesh and never allow them to lose this. Close stabling is expensive and unnecessary. Open sheds that are well bedded are fine as they allow plenty of exercise and air. The colts will look shabby with their ungainly limbs and rough coats, but if the feed is kept coming at them all winter they will come through as healthy as you wish. The breeder who can get his colts through the first winter in as good shape as they entered it is an artist and should achieve success.

As feet and legs are the most important parts of the horse they should receive attention. The growth of the feet during the first year makes or mars the set of limbs and the shape of the feet. Trim the feet every six or eight weeks whether they look bad or not. Trim so that the feet are flat on the frogs and the front of the hoof has a 45 degree slant. The foot becomes large and well rounded and the hoof head develops large and strong, giving a base that will carry the ton horse when he develops.

Care of the Harness.

It is a business proposition for every farmer to take good care of his harness, for not only does the harness last longer, but danger of accident is much lessened. Many, many runaways occur every year just because some weak place in the harness is let go and not attended to in time. Sometimes in spite of the utmost vigilance little things will escape us, but nine times out of ten the drivers are aware of the condition of the harness and do not fix them out of sheer negligence. Many broken bones and large repair bills testify that this is very expensive neglect.

The life of a harness may be greatly prolonged by proper care and handling; heavy pieces should never hang over the lighter pieces. It is best to have a separate hook for the bridle. It pays well to have a special room for the harness constructed so as to be handy and free from moisture. It is a very bad plan to hang harness behind the horses in the stables, as the gases and moisture from the manure rots the leather very fast. Harness should be cleaned and oiled two or three times every year.

In cleaning the harness it is best not to use water. If water is used the leather is filled with moisture and the oil does not penetrate it very well. Soaps are hard on leather, as most of them contain lye, which does much harm. The harness can be cleaned thoroughly and easily without moistening it.

It is a good plan to keep a supply of rivets and other articles handy in repairing harness on hand and mend the harness as soon as it shows signs of weakness. Much money can be saved in this way. Another important thing is to always have the harness fit the horse which is wearing it. If the harness is big for the horse there is a great strain upon the harness and great discomfort to the horse. The same is true even in greater sense if the harness is very tight. Some part is liable to give way at any time. No matter in how big a hurry, the harness should be readjusted to fit the horse before starting if it was used upon a different horse peeviously. I believe the time I spend in caring for my harness is very well spent and believe that I save quite a little each year in this way.—C. J. Griffing.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevets the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunche sof all kinds.

Before Using

CURES:
SPLINTS
CURBS
SPAVINS
ENLARGEMENTS
COUGHS
COLDS
DISTEMPER
GLANDERS
FOUNDRES

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR:--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it. Very truly,

RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR:--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

March 28th, 1911.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN:—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS:—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

"BETTER FARMING SPECIAL TRAIN"

Dates and Hours Along the I. C. R. System.

The Farming Demonstration Special Train will start its tour of the Intercolonial Railway in New Brunswick under the auspices of the provincial government on Friday, June 21st, from Fredericton.

The "Better Farming Special" will be composed of seven cars; three baggage cars being fitted with exhibits and specimens of farming products chiefly from the McDonald College Farm near Montreal, supplemented by a number of native exhibits from New Brunswick, including apples and other fruits, as well as grains, etc. There will be two first-class coaches for the lecturing staff and assistants; one sleeping car and one dining car.

The Intercolonial Railway has arranged for the issue of return excursion tickets at single fare from all stations to the nearest point where the demonstration car will stop.

On leaving the Province of New Brunswick at Campbellton, the train will pass under the jurisdiction and control of the provincial government of the Province of Quebec.

The dates and hours over the Intercolonial system and which intending visitors to the cars and lectures should preserve, are published as follows for the convenience of farmers and those interested.

FRIDAY, JUNE 21.—Train leaves Fredericton on the Canada Eastern Division of the Intercolonial and halts for lectures at Durham, Cross Creek, and Boiestown.

SATURDAY, JUNE 22.—At Doaktown from 9 to 11.30 a. m.; at Blackville from 13.00 to 15.00; at Millerton from 16.00 to 18.00; and at Chatham from 19.30 to 22 o'clock.

MONDAY, JUNE 24.—At Sackville from 9 a. m. to 11.30 a. m.; Memramcook 13.30 to 16.00; and at Moncton from 19 o'clock to 22 o'clock.

TUESDAY, JUNE 25.—At Salisbury from 9.30 a. m. to 11.30 a. m.; at Petitcodiac from 13.30 to 16.00; and Sussex from 19.00 to 22.00.

WEDNESDAY, JUNE 26.—At Norton from 9 a. m. to 11.30 a. m.; and Hampton from 13.00 to 15.30.

THURSDAY, JUNE 27.—At Harcourt from 13.00 to 15.30; at Rogersville from 16.30 to 18.30; and at Barnaby River from 19.00 to 22.00.

FRIDAY, JUNE 28.—At Bathurst from 9 a. m. to 11.30 a. m.; at Nash's Creek from 13.00 to 15.00; at Charlo from 16.00 to 18.30.

SATURDAY, JUNE 29.—At Dalhousie Junction from 9.00 to 11.30; and at Campbellton from 13.30 to 16.30.

Lampas.

The cruel operation of burning the bars for the cure of lampas is still much more common than is generally supposed, or can be gathered from the smaller number of prosecutions that take place—small because such cases do not come to the knowledge of those in a position to prefer a charge of cruelty. It is humiliating to think that in these days of free and compulsory education, when elementary anatomy and physiology are taught in the National Schools at the expense of the ratepayers, and continued at the cost of the same by veterinary lectures under the auspices of county education authorities, and there is an abundance of cheap literature relating to the management of farm animals and the treatment of their simple ailments, there should be found such culpable ignorance. One of the principal reasons for its persistence, apart, of course, from tradition, which is powerful in the stable and the forge, is its recommendation in old works on farriery, to which their owners cling with an obstinacy surprising when reliable popular works on the treatment of animal diseases are so cheap and easily procured as to be within the reach of everyone, and so simple as to be capable of being understood by those of average intelligence, or whose education was not acquired at a public school or university. In an old book reference is made to lampas as an excrescence. It does not seem possible that in these days the swelling of the bars popularly known as "lampas" could be regarded as an excrescence requiring to be destroyed, but the fact remains that it is, and that the hot iron is often employed to burn it away.

The swelling behind the bars is not an excrescence, but arises from congestion of the blood-vessels in the lining membrane of the palate, the swelling being mostly met with in young horses during the process of teething. It occurs occasionally in old horses from irregularities of the teeth, or may arise in any horse from inflammation set up by bit injuries, but for all practical purposes it may be regarded as a juvenile trouble. Owing to inflammation of the gums, set up by the irritation caused by the eruption of the permanent incisors, extending to the palate, it swells and becomes level with, or projects beyond, the nippers and causes feeding to be a painful business. Colts at grass rarely suffer much, as their food is cooling, tender, and easy of digestion, but it is the young horse that has been taken into work and fed on hard corn and dry hay that the condition affects most severely. The spring of the year, when the dental changes are in progress in horses under six years old, is the season when lampas gives most trouble.

In addition to the slight fever and constitutional disturbance associated with difficult dentition in most young animals, including the human baby, the colt falls off a good deal in condition, because an insufficiency of food is eaten, and what is taken is badly masticated. Generally, an alternation in the diet to wet bran and boiled oats, tender green meat, or other soft food, at the same time easing or stopping the work, will suffice to cure because in a few days the inflammation and soreness pass away and the colt can feed again in comfort. In cases where the congestion is considerable and the palate projects below the incisors, all that is necessary is to scarify the swollen bars lightly with a lancet or sharp, clean penknife, these superficial incisions resulting in the abstraction of a little blood. It is, however, only in extreme cases that lancing with a knife is necessary. Given a few doses of alterative and cooling medicine, and a soft diet, the swelling soon disappears. Green meat in season, pulped roots, preferably carrots, in winter, crushed or boiled oats, and bran and linseed mashes with some scalded hay, form the best diet for the stabled colt. Under no circumstances should the hot iron be applied to the swelling, not even lightly, for it is not only illegal and cruel, but calculated to aggravate matters by destroying the mucous membrane of the palate and causing more swelling.—Pateley Bridge.

Gombault's Caustic Balsam
The Worlds Greatest and Surest
Veterinary Remedy
HAS IMITATORS BUT No COMPETITORS!

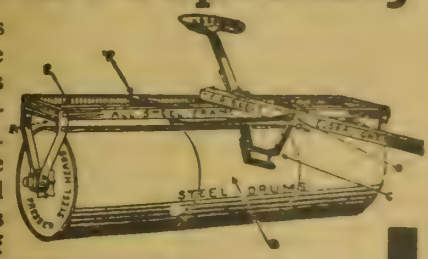
"Bissell" rollers are a specialty



The "Bissell" Rollers are built by men who have made a life study of this work, and are SPECIALISTS IN THE BUSINESS. Search as you may, there are no such perfect Land Rollers on the Continent as the "Bissell." Make a note of these points and compare the "Bissell" Rollers with any other Land Roller in America. If the "Bissell" does not convince you that it is the best Roller, then don't buy, but you ought to know the facts, and it will do any person good to make the comparison. No need to send special travellers to sell "Bissell" Rollers. Practical farmers see the difference and prefer the "Bissell."

The 18 cold rolled anti-friction Bearings ½ inch thick with lathe cut ends, held in the one piece Malleable Iron Cage, is a single point placing the "Bissell" Roller away ahead.

Look for the name "Bissell" on every Roller. No other is genuine. Ask Dept. M for free catalogue.

Valuable Book on Barn Building FREE

Write at once for this valuable book. It contains information that every farmer should have regarding the sanitary housing of dairy cows. It explains every fundamental of correct construction and gives proper dimensions and arrangements. It describes lighting, ventilation, stable floors, and their construction, and contains suggestions about silos, site, exposures, appearance, design, drainage and inside equipment. Besides, you will find in this book a number of practical barn plans and other information that may point the way to your saving many a dollar. We have designed many of the finest and most modern dairy barns in this country and this book is based on our long experience and expert knowledge in dairy barn construction. The book contains in concise, clear and condensed form, information necessary to any farmer who is planning to build or remodel. Understand, we send you this book absolutely free without any obligation on your part—just for answering these few questions: Do you intend to build or remodel? How soon? How many cows have you? Will you want a litter carrier? Will you want a hay fork outfit? Send to-day.

POULTRY.

New Method of Relieving Crop-Bound.

Practically all the writers on above subject recommend the operator to stitch up the incision after the operation, and as I have found by experience there is a simpler and better way, I would respectfully submit a new method of relieving such cases, for the consideration and practice of your readers. I will pass over all preliminaries leading up to the point where an operation is necessary to save the life of a bird, and treat only the way to do it quickly and safely. The only instruments necessary are an ordinary pocket knife with one sharp blade, a button-hook, and a bottle of peroxide of hydrogen.

If you have ever noticed a half-grown chicken with a full crop, you have observed that at right of neck and top of crop you could see contents quite distinctly owing to transparent nature of tissue and practical absence of blood vessels. This is the place to make an incision about one-half inch long after plucking a few feathers. With button-hook remove cause of obstruction and practically all the contents. Cleanse the wound well with hydrogen, and confine bird for few hours, then give wound another dressing with peroxide by dropping it on. Feed the bird soaked stale bread lightly for the first day and turn out with others. After twelve hours there is absolutely no danger of over- eating or drinking, as the wound is sufficiently sealed to cause them pain as soon as they eat or drink enough to cause distention. The wound seals up and heals naturally, no stitches being necessary. Dress the wound night and morning for four or five days with peroxide, by dropping it on.

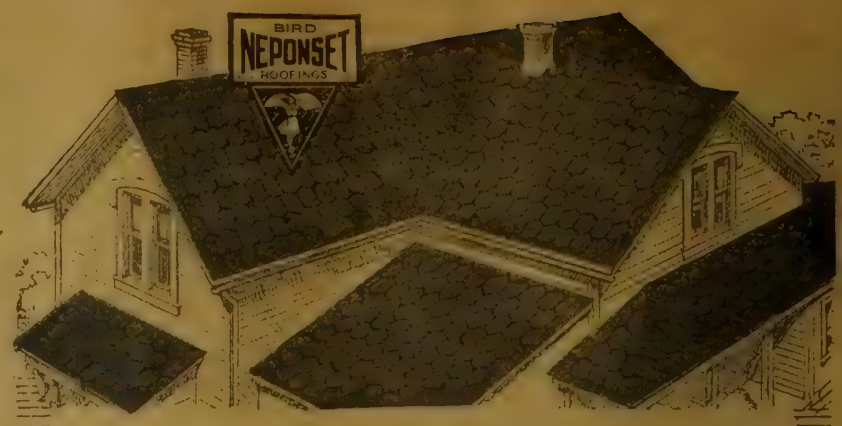
After one or two operations, this method is so simple, safe and sure you will not give the matter a second thought, and by taking the case in time all offensive features of sour or foul odors are overcome, and the bird is not checked by the process. In fact, one night or day's suffering before given relief sets them back more than an operation.

I have used this method (without stitches) upon my own and neighbors birds for the past four years, and have never lost a bird or had even an unfavorable symptom, the most notable of which was in the spring of 1911, an operation on a chick fifteen days old for ptomaine poisoning, with complete success.—S. K. Burdin in Poultry Advocate.

Handling Eggs through the Creamery.

There are several other lines that might be enumerated, but handling eggs seems to be the most satisfactory in connection with a creamery.

Handling eggs has been found an ideal side line for the creamery when properly regulated. The teams that bring milk and cream to the creamery can also bring eggs produced by the patrons, with practically no extra expense. In this way the creamery can secure the eggs at frequent intervals and under such restrictions as will insure their being absolutely fresh and of finest quality. It can also cool the eggs if necessary and market them in a manner that will secure a premium above the quoted prices for the finest grades. Statistics show that under ordinary conditions of marketing there is a great loss on account of poor eggs. There is also much dissatisfaction from the consumer for the same reason, but where the producer is made responsible for the quality and the creamery, with its facilities for handling them properly, is made the central market, the consumer finally gets a grade of



Isn't This Roof Attractive?

At last you can have a really artistic roof that resists fire and that is within reach of the average man's pocket-book.

NEPONSET PROSLATE ROOFING

Red or Green Colors

A modification of the permanent, long-life roofing materials that we have been making for years, combined with a permanent colored surface. Made in attractive red and green colors. Meets the economic need of a durable, fire-resisting roof at a moderate price.

NEPONSET Proslate sets a new roofing standard. How does it look to you? Can you afford to consider best shingles, or even slate, when you can get such a roofing as this for less money? NEPONSET Proslate is perfectly adapted for use on *your* house.

This makes them sell like hot cakes. When sold, return us the money, only $2.50, and we will promptly send you all 5 handsome presents carefully packed, exactly as represented We arrange to stand payment of all charges right to your door with free goods covering same. **DON'T DELAY,** write us to day, and in a few days you can have the magnificent house and all the beautiful presents. Address— **NATIONAL SALES CO., Ltd. TORONTO, ONT.**

Dept. H '264

The Advertisers in The Maritime Farmer are worthy your confidence.

eggs for which he is willing to pay a high price.

The plan that has proved most successful is for the creamery to deliver egg cartons and a private stamp to each patron. The eggs are stamped, placed in the cartons, sealed as soon as gathered, and kept cool until delivered.

In securing a market for guaranteed fresh eggs through a creamery, patrons are usually pledged to comply with certain rules, and in case of failure to do so they are forbidden the privileges of the market. They usually agree to deliver eggs that are not over a specified number of days old and to gather them twice daily; to grade the eggs to secure uniform size; to keep white and brown eggs separate; to keep eggs clean and to store them in a cool, dry place; to stamp each egg and the carton in which they are placed; and not to sell eggs stamped with the creamery stamp to any other parties.

Prices received for eggs produced and marketed in this way usually range from 2 to 5 cents a dozen over the ruling price, and in some instances where special markets have been developed even greater premiums are secured. Doubtless many creameries can in this way improve their condition and secure closer co-operation with their patrons with little if any added expense.

Feeding Laying Hens.

Throught their entire life those birds intended to be kept for egg production should receive a relatively narrow ration. This owing to the comparatively rapid growth which a bird makes during its early life, and later on those hens that lay throughout the year should receive a narrow ration, in order that they be able to supply material for egg production. First of all, the birds should be fed a wide variety of clean, wholesome foods. These can be easily divided into four groups—grains, green feeds, meat and grit. The last three the birds will supply for themselves during the summer when they are on the range; but through the winter they must be supplied them in some way. At present the most popular ways of feeding green feed are in the form of cabbage, mangels, or sprouted oats—the birds being given one feed each day. Clover is an excellent feed and much relished by the hens. It can be cut into short pieces, or clover chaff can be fed with good results. The meat feed can be supplied in the form of meat scrap, green cut bone, or milk. The birds crave this food during the winter, and if it is supplied they will respond with an increase in egg production. A variety of grains should be fed, both in the form of cracked grain and mash.

In feeding laying hens, the poultryman should have at least one object in view—to feed in such a way that the birds will be kept active and hustling throughout the day and to supply them with an abundance of wholesome foods. The system of feeding recommended by the Maine Experiment Station accomplishes this, and has proven to be most satisfactory:

Dry grain (fed in litter). Early morning feed—cracked corn; 10.30A. M. feed—equal parts of wheat and oats. These grains are fed at the rate of two qts. to 50 birds.

Dry mash—first month in laying house; wheat bran, 300 lbs.; cornmeal, 100 lbs.; Daisy flour (or other low-grade flour), 100 lbs.;meat scrap, 100 lbs. Second month in laying house—Wheat bran, 200 lbs.; cornmeal, 100 lbs.; Daisy flour (or other low-grade flour) 100 lbs.; gluten feed, 100 lbs.; meat scrap, 100 lbs. Third month in laying house—The mash has the same composition as that of the second month, with the addition of 50 lbs. linseed meal. Fourth month—The mash is the same as that for the second month . Fifth month—The same mash is used as for the third month.

From this time on 50 lbs. of linseed meal are added to the mash, as given for the second month, every alternate month. This dry mash is kept before the birds all the time in open hoppers.—W. F. Schoppe, U. of M.

THE PEERLESS INCUBATOR AND THE PEERLESS WAY HAVE DOUBLED THE PROFITS OF 20,846 FARMERS

ANY farmer can raise "poultry-for-profit" on the same plan and under the same conditions as we do it at the Poultry Yards of Canada, Limited, and make just as big a success as we have made of this, the largest and most profitable poultry farm in the Dominion. You can do it. You can put to work for you The Peerless Way and the Peerless Incubator and double or treble your profits right from your first month. Over 20,846 Canadian poultrymen have proven this. By following our system, they are making their poultry pay them greater profits than they ever dreamed was in the business.

THE book, "When Poultry Pays," tells what hundreds of followers of The Peerless Way have accomplished. It tells why the price of eggs doubled in seven years it tells about a market that exceeds the supply by 200%;—it tells about a plan that is more than merely a system of poultry-raising—a plan that raises poultry **at a profit**; it tells about co-operative marketing—how the highest prices are secured in either large or small quantities; and, by no means least, it tells you exactly how to get started in this field of profits that lies right at your door. You will find this book full of facts and figures and other information that will make you open your eyes to the real profits in poultry **Do not put it off. There is no time like the present. Send for the book NOW.**

We Will Show You The Best Way To Start.

YOUR start is important; without experience or guidance, you can badly handicap yourself in the beginning. It may take years to overcome a bad start. The Peerless Way will put your first step on the right road to success, will show you the incubator and brooder that meets the climatic conditions of Canada's cold winters, and will furnish you with plans, blue-prints and complete specifications of poultry houses, etc., that are actually being successfully used today in Pembroke at the Poultry Yards of Canada, Limited.

We Will Show You How To Get Better Prices

THIS alone is a valuable part of the service included in The Peerless Way. We guarantee to find for all your poultry products, buyers who will pay you the highest spot-cash prices and who will charge you no commission for the service either. You do not need to be dependent upon the middleman and cold-storage buyer when you understand co-operative marketing. You do not need to give away part of your profits; the last few cents on every deal is your own "velvet"—and goes into your own bank account.

You Can Learn At Home or Come To Pembroke—As You Prefer.

THE Peerless Way, combined with the free, personal advice of our Poultry Advisory Board, will make poultry-raising profitable for you. If you will take the Peerless Incubator and Brooder and just follow the plain, explicit directions of The Peerless Way, step by step, you cannot go astray. Or if you prefer it, you can come to Pembroke and, on payment of a small tuition fee, take a course of personal instruction at the Poultry Yards of Canada, Limited.

Proper Temperature For Keeping Eggs.

A discussion regarding how much cold eggs intended for incubation can withstand and still hatch into normal chickens has been going on lately in some of the agricultural papers. The statement has been made that no exact scientific studies have ever been carried out to determine this point. Dr. Raymond Pearl, biologist of the Maine Agricultural Experiment Station, in discussing this matter, points out that careful investigations regarding his point were made by European workers many years ago. As early as 1875, an Italian investigator, Colosanti, showed that eggs could be kept at temperatures down as low as 12 degrees, Fahr., for from one to two hours with absolutely no injury to the germ. Twenty years later, a Frenchman, Pictet, studied the matter in still further detail and showed that if the time of exposure to cold was for a long time, the egg was killed, even at considerably higher temperatures. This investigator found that about thirty degrees Fahrenheit, was the lowest temperature at which the egg would survive an exposure of any more than one or two hours' duration. It has been shown by another Frenchman, Raubaud, that the germ of a hen's egg can withstand a very extreme degree of cold for a short time. He kept eggs at a temperature of about one-half a degree below zero for half an hour without killing the germ. It is thus plain that this interesting matter has been studied scientifically.

For the practical poultryman keeping eggs for incubation, however, the important thing is not to know the lowest temperature which an egg can possibly endure for a brief period and still hatch, but rather to know what holding temperature for eggs will give the best results in the subsequent hatch, in respect to both number and quality of chicks. Careful experiments on this point have shown that one gets the best results by holding eggs pending incubation at a temperature somewhere between 50 and 55 degrees, Fahr. Eggs held in this way turn out more and better chickens than those held for incubation at either higher or lower temperature.—Chas. D. Woods, in Maine Farmer.

Storing Eggs for Hatching.

Place the eggs, on the day they are laid, in a room where the temperature is constant. Eggs are, says Farm, Stock and Home, at their best for incubation purposes at the time of hatching, but it is not always practicable to set or incubate them immediately. A low temperature of from 40 to 60 degrees Fahrenheit, will be found best. It is a common practice in some quarters to turn the eggs daily during this resting period. Experimental data on this point is lacking, and it is doubtful whether the practice has any merit. The fresher the egg the more viable the germ. After the age of two weeks, depending much on the temperature, it is not usually safe to use eggs for incubation purposes.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

With Mirandy Away.

Mirandy's been away from home the
last two weeks or so,
Not off at some resort, but jest a-
visitin', you know;
An' I've been cookin' fer myself, be-
sides a-doin' chores
Aroun' the house, like churnin', wash-
in' dishes, sweepin' floors.
I've done the very best I could t'
keep things trim and clean,
An' yet the house is cluttered up the
worst you've ever seen.
I'm wonderin' if disorder's imps
'gainst wifeless man connived
When Adam batched in Eden ere his
better half arrived.

I've known some rather handy men
about the house, 'tis true;
But, sakes alive! some woman had t'
tell 'em what to do.
An' though she'd find in all their
methods nothin' t' condemn
It kept her busy traipsin' 'round t'
pick up after them.
When femininity has flown there's
scores of things misplaced,
There's litter if there isn't dust, un-
tidiness and waste.
Did home, not having known her
touch, see empty an' deprived
When Adam batched in Eden ere his
better half arrived?

I ask myself such things, I guess, a
hundred times a day.
It's, somehow, been so lonesome since
Mirandy went away.
Of course, in that primeval day there
wasn't roof or floor;
There wasn't churnin', sweepin', then,
or any little chore
But even that far back there must
have been some work fer man;
I'm sure there was when woman came
an' home-life first began!
The question is: Were things mussed
up, though endlessly he strived,
When Adam batched in Eden ere his
better half arrived?

—By Roy Farrell Greene.

Love's Barrier.

(Continued from last issue).

CHAPTER XXIV.
THE CONFLICT.

Secretan came in from the early service to find his wife busy with her letters. He observed her slip one into her pocket at his entrance, and though he made no remark, his face perceptibly hardened. There was now a wall of restraint between them. The old sweet comradeship had undoubtedly suffered serious hurt. She scarcely smiled at his entrance, and no word of pleasant greeting or inquiry passed between them. They had ceased apparently to have a common interest in the happenings of daily life. It was now in the month of October, and the world in these high latitudes was full of the premonitions of an early winter. Already the robins were hopping familiarly about the garden paths and on the smooth lawns, where the hoarfrost had not yet been melted by the morning sun.

Four cups and saucers stood on the tray in front of Helen, the children's visit to Midcar having been prolonged far beyond their anticipation. Their mother was still abroad, where apparently she had found something to interest her; but Helen had that very morning received some definite information regarding her movements.

"I've had a letter from Cynthia," she said as she proceeded to make the tea. "She is coming actually this afternoon! So like her! She never troubles to consider the convenience of others."

"It is certainly very sudden. Where does she write from?"

"Baden-Baden, and she is down on her luck. She says another of the mushroom friendships, for which she has a peculiar penchant, has burst like a bubble. Consequently she rails at the world in general. Will you read her letter?"

"No, thank you. I will speak for the fly as I go down. I am going to London myself this afternoon."

"To London!" she repeated, and looked at him with a swift inquiry. Time was when she would have known all his movements; when even his intentions would not have been hid. But the barrier had grown up, had been growing steadily since the breaking of Audrey Hayes's engagement, and nothing had been done to break it down. If Helen felt that she had been unjustly blamed, she gave no sign. She loved but her pride was very high. She would not stoop to beg the explanation for which her soul craved. She hungered for expression of the love which had become so dear a part of her life, but she would not beg for it. She had no idea of the depth and darkness of the passion that smouldered in Secretan's soul. He was the prey of distrust, of foreboding fears, of a jealousy as cruel as the grave. He misunderstood her silence and magnified every trifle to her condemnation. They had never spoken of the matter since that miserable day when they had met in Mardocks Wood. Secretan had fully expected an explanation but when none came he hugged his suspicions to his soul and sat in judgement.

He no longer believed that the story she had told him that day in the Castle Gardens was true; at least, it was not the whole truth. He felt himself aggrieved; he was the prey of the most miserable feelings that can rend the heart of a man and rob him of the zest of life.

Outsiders saw no change in the Rectory life, and even their few intimates were deceived. Helen was absolutely mistress of herself. She was less bright, perhaps, and there was a habitual seriousness in her eyes, but she made no change in the order of her life. She was busy all day, apparently, with affairs of the house, with the work of the parish, which had gradually increased on her hands. None hesitated now to come to the Rector's wife; she never failed them. And there was a particular depth of sincerity in her sympathy which helped more than anything. The woman who has suffered never makes light of the suffering of others.

More change was visible in Secretan. He possessed less share of self-control. Helen came of a race of soldiers, and had learned to endure and make no sign. Secretan chafed under the cloud that obscured his personal happiness, but did not know how it was to be removed. There were moments when he bitterly regretted those hours in the Luxembourg Gardens, which had made such an upheaval in his life. He showed a lack of charity, a harshness of judgment, which would have surprised those who only knew him as a genial person, always ready to do a kind act. Helen resented his coldness, and had no idea how his soul was tormented for himself and for her. A chance word dropped one morning as she had been getting ready for the early service, caused her to understand that he was not certain that she was eligible. It was only a word, but it sped like an arrow to the mark. She quietly laid off her things, and from that day had not entered the church. As yet, however, the parish had not passed any strictures; they imagined another reason sufficient to excuse anything. But both Secretan and his wife were aware that this sort of life could not go on.

"I think I will take a holiday this month. It will be a suitable opportunity when you have Mrs. Revell with you."

"Very well. Where do you think of going?"

"To Holland and Belgium. Westerton, who disappointed me last year, is free now. If you have no objections I will go to-day. I have made full arrangements for supply. You will only have the preachers for the week-ends. The Iffley curate has undertaken the rest of the work."

"Very well," she repeated. "How long do you expect to be away?"

"About three weeks." At that moment the children came bounding in, with their morning faces full of the usual fun and high spirits, which were perceptibly damped when they heard who was coming.

"But we shan't have to go to Colchester, shall we, Helen?" cried Margot. "You won't let mummy take us away!"

The look of appeal sent sudden swift tears to Helen's eyes. Secretan noticed them, and they stabbed him to the heart. She was still dear to him, though he had tried to harden his heart against her. He thought she had failed in duty to him; that he deserved a fuller confidence regarding what had happened at High Ridges. That it was Helen who had broken the engagement he had no manner of doubt; it was the cause that tormented him.

For it was a big thing to do and her reason must have been of the most insistent kind.

"You are happy, then, with poor old Helen; you don't want to leave her?"

"Shan't leave her!" said Margot, with a touch of the old petulance which under Helen's firm, wise dealing had become less troublesome. "Geoff and me's made up our minds to hide on the moor right up at Mardocks Ghyll, if she wants to take us away. And Aunt Jane has promised to take us in at the farm, too."

Helen smiled across the table at her husband; but his eyes were on his plate. Her tears haunted him. She was unhappy, her face was pathetic and he had not the right to comfort her. She had refused him that right, and until she came to him of her own accord he could do nothing. But he did not see gathering slowly in her heart a resolve to mend or end this state of affairs that had become intolerable to her. Early in the afternoon, when all the arrangements for the journey had been made, she tapped at the study door. Secretan, making a few last notes of forgotten duties, bade her come in. She was rather pale, but her lace wore an expression of great sweetness.

When she spoke her voice was without a tremor.

"I have come to ask before you go, Claude, why I am treated like this; and whether, when you come back, you will go on treating me in the same way?"

His face flushed, and something flashed in his eye.

"It is a painful subject to go back upon, Helen," he answered. "But surely there is no need to ask such a question! You did not treat me fairly about the affair of Major Hunt and Audrey. You have never explained that ghastly day when I saw you and him together in the Mardocks Wood. I am a mere man, Helen, and you left me to draw the usual deductions."

"What were they?" she asked, a little hardly.

"Why, that you had kept something back, of course."

She put up her hands suddeny as if the words wounded her.

"You took my word that day at Colchester. I told you all that was necessary. Yo u believed me then, Claude, when you had less cause. I mean I was then a stranger to you. I have been your wife to very little purpose indeed if you can condemn me now."

"It was a matter on which I had the right to your full confidence the right of a husband. I have been waiting for that confidence. So long as it is denied me I must continue to draw my own conclusions."

'Against me?"

Her sad eyes, full of that haunting pathos, made him feel miserable and mean. He avoided their steady gaze, and, moving towards the writing-desk which stood across the smaller window, fumbled in his pocket for the keys.

"There was nothing to tell," she said, with extreme difficulty. "The matter was entirely private. It concerned the happiness of another. I thought it my duty to intervene. A year ago I should have been less insistent on duty. Life got a new meaning for me here; but now the clouds have rolled up again, and I don't know where I am or how I stand."

WOMAN SICK FOR YEARS

Wants Other Women to Know How She was Finally Restored to Health.

Hammond, Ont. — "I am passing through the Change of Life and for two years had hot flushes very bad, headaches, soreness in the back of head, was constipated, and had weak, nervous feelings. The doctor who attended me for a number of years did not help me, but I have been entirely relieved of the above symptoms by Lydia E. Pinkham's Vegetable Compound, Blood Purifier and Liver Pills, and give you permission to publish my testimonial." — Mrs. Louis Beaucage, Sr., Hammond, Ont., Canada.

New Brunswick, Canada. — "I can highly recommend Lydia E. Pinkham's VegetableCompound to any suffering woman. I have taken it for female weakness and painful menstruation and it cured me." — Mrs. DeVere Barbour, Harvey Bank, New Brunswick, Canada.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotic or harmful drugs, and to-day holds the record of being the most successful remedy for female ills we know of, and thousands of voluntary testimonials on file in the Pinkham laboratory at Lynn, Mass., seem to prove this fact. Every suffering woman owes it to herself to give Lydia E. Pinkham's Vegetable Compound a trial

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Her words moved him mightily, again he hardened his heart. Fitting the key in one of the drawers, he drew forth an envelope and took a folded piece of notepaper from it, which he handed her with-out a word. She glanced over it; her face flushed deeply, aod with a sudden gesture of passion she threw it into the fire.

"So you condemned me on that, on an anonymous letter! Then, indeed, there is no more to be said."

She went out of the room with her head high in the air. They had no further opportunity of private speech that day; indeed, neither sought it. Secretan's quick temper had been roused by her action, and his jealous heart continued to be tormented by her silence. It was a miserable day.

He bade her "Good-bye" in the presence of the children, and not one word of a tender or hopeful nature passed between them. Helen did not know that he had another appointment with the bishop before he set out on his holiday. It was well that he had kept his intention from her. She would certainly have misunderstood and resented it.

Secretan did not show himself strong in this crisis in his life. He had not Jane's clear fixity of purpose and calm ind ement. In his marriage he had perhaps shown himself at his best; all his manly qualities had come to the front; he gloried in the idea of being a tower of strength to the women who had trusted him, and whom he loved.

But the close strain of married life, the daily round, the common task, had found him wanting. He preached charity, forbearance, long-suffering to others, and lacked them all himself. He had even, through the strain of his mental anguish, become irritable, fault-finding, wholly changed. Helen, on the other hand, had changed but little. She had been trained in a harder school, and had grown accustomed to disappointment, to disillusionment and to silence. Once more disappointment was hers, and the tower against which she had leaned had failed her; that was all. She became a little more self-contained, a little less demonstrative, but was invariably gentle. Otherwise more acute friction must have ensued. She was conscious of a great relief when Secretan left the house. No longer subjected to the strain of the dual life, they might arrive at some better understanding; at least, there would be time to face the situation fairly and frankly without prejudice from without.

Soon after Secretan left the house, Jane arrived to spend the afternoon. She had given Sir Anthony Bede a provisional promise to marry him some day, and she was astonished at her own happiness. Perhaps happiness makes us selfish; certainly Jane had not observed anything amiss between her brother and his wife. As a house of defence she, too, had failed. She was unaware that Helen had anything to do with the breaking of Audrey Hayes's engagement.

"Claude has gone away on his holiday, and alone," she cried incredulously. "Why, I never heard of such a thing! Why couldn't you have sent the children up to me? Or I could have come here. You ought to have gone, Helen! You need a holiday desperately. I was only thinking so the last day I saw you."

"Claude is going with Mr. Westerton to Holland and Belgium. Besides, I could not have gone in any case. I am expecting Mrs. Revell this evening."

"She comes to take the children away, I suppose? Then you will follow Claude—join them somewhere? Do, Helen; it would do you immense good; and I am sure Claude will never get the good out of his holiday unless you are there."

"On the contrary he will enjoy it better," replied Helen, with a slight

Fragrance

WHEN you open a tin of Red Rose Coffee, you will surely be pleased with its unusual fragrance, and you will note particularly the small, even grains, free of the yellow flake or chaff which you have always been accustomed to see in the ground coffee you have used. This is the result of our new crushing process. The small grains settle quickly, so the coffee is never muddy, but always bright and clear. You will be convinced before you taste it, that it is a coffee of unusual quality.

Ocean Limited Early on Route.

SUMMER TIME CHANGE ON INTERCOLONIAL RAILWAY JUNE 2.

The summer change of time on the Intercolonial Railway will go into effect on June 2nd, when the famous Ocean Limited will be placed on the route between Montreal, St. John, N. B. and Halifax, N. S. with connections for and from the Sydneys and Prince Edward Island in anticipation of an early rush of summer travel. The time schedule is expected to be practically the same as last year, which means that the "Limited" will leave Montreal at 7.30 p.m. reaching Levis at midnight, and giving through passengers the opportunity of seeing the famed Matapedia Valley during the earlier hours of the morning and a view of the Restigouche River and the blue waters of the Baie des Chaleurs. The beautiful valley of Wentworth, N. S. will be seen in the more mellowing light of early eventide, and the train will reach Truro at 8.00 o'clock connecting with the through night express for the Sydneys and arriving at Halifax at 10.00 p.m.

The Maritime Express under the summer schedule will leave Montreal at 8.15 a.m. and through passengers will have the daylight journey through Quebec, and a view of the majestic St. Lawrence as it widens in its course to the sea. Making connection at Moncton with morning express for St. John the Maritime continuing eastward will reach Halifax at 13.30.

The Ocean Limited will leave Halifax westbound at 8.00 a.m. and the Maritime Express will leave as usual at 15.10 thus there will be a through week day service by two trains equal to the best on the continent.

cold smile. "Well, and how are you, dear Jane? We don't see much of you in these days. Prospective matrimony seems to be an absorbing occupation."

Jane sat back in her chair and laughed cheerily.

"It isn't that. My hands are full with Tom! What a baby he is! I believe he is going to marry Anne Coyne's niece. Things are shaping that way, and it would be a very good thing for her."

"But isn't she very young?"

"Not so very; six-and-twenty, and an uncommonly sensible girl. She's very fond of the children, too, and she has both tact and firmness. She isn't at all afraid of Tom. Oh, poor Emmy! What mistakes she made! I can see them now. She ought never to have been Tom Courtney's wife."

"It seems to me ," said Helen, hardly, 'that most husbands and wives would be happier yoked to some-body else."

Jane pondered these words later and remembered their significance.

When Helen met Cynthia at the station she was surprised to feel that she was quite glad to see her. Dressed in a most becoming costume and a coquettish hat, Cynthia was looking her very best. She kissed Helen effusively and appeared really glad to see the children.

"So your parson has run away! I'm very sorry, I was looking forward to seeing him, you may tell him. I think he might have at least waited to receive me; especially as I have only two days to stop. Yes; they've left the house, and I must get home at once to put it in order. I have visitors coming on the twentieth. I'm really awfully obliged to you for looking after the kids so long. They look bloomin, both of them, though I expect they will never be happy in Colchester any more."

A little later in the evening, when Cynthia had explored the house and expressed herself enchanted with everything, she put the question Helen had been dreading.

"I met Lady Adela Hunt at Adelboden, Helen; she's going to stay there for the winter. I want to hear what happened about Major Hunt's marriage. Did you put the spoke in the wheel?"

"Yes."

"But, why, Helen? It couldn't do you any good. Lady Adela was sure you had done it, but I protested you were above such a mean trick. It was a mean trick, you know; the sort of thing I might easily descend to; but you, a parson's wife, too! and such a charming person! Why did you do it?

Helen remained silent, wondering whether it would be possible to make Cynthia understand. She was surprised that she felt relief now that the ice was broken, and that she was even anxious to vindicate herself.

"I didn't think he was a fit husband for Audrey Hayes; you would not have thought so either if you had known her."

"But, heavens, Helen, what had that got to do with you? I should have thought, now, you had enough to do with your own affairs. I'm sure I have. I never meddle with anybody. Besides, it wasn't a Christian act. I thought you had got religion. Somebody told me that, but, like most gossip, it can't be true. Of course, no Christian would have done such a thing. Whatever the man was, you were done with him, and he ought to have had his chance."

Helen sat very still, and something seemed to close about her heart. Cynthia's opinion might be taken to represent the world. She felt uncomfortably stabbed. After all, it might be true; it was no concern of hers. She had destroyed her own happiness, and the happiness of others for an idea of duty wholly mistaken. The cup of her misery seemed full.

WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont. 6

Burdock Blood Bitters

CURES ALL

SKIN DISEASES

Any one troubled with any itching, burning, irritating skin disease can place full reliance on Burdock Blood Bitters to effect a cure, no matter what other remedies have failed.

It always builds up the health and strength on the foundation of pure, rich blood, and in consequence the cures it makes are of a permanent and lasting nature.

Mrs. Richard Coutine, White Head, Que., writes:—"I have been bothered with salt rheum on my hands for two years, and it itched so I did not know what to do. I tried three doctors and even went to Montreal to the hospital without getting any relief. I was advised to try Burdock Blood Bitters, so I got three bottles, and before I had the second used I found a big change; now to-day I am cured."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

MOTHERS' CORDIAL OR HERBAL TONIC 17

Lessens the dangers of childbirth—aids quick deliveries, making them easy—shortens confinement and pain—strengthens mother and child—makes recovery rapid, and both mother and baby healthy and good-spirited.

Mothers' Cordial or Herbal Tonic is also a sure preventative of delayed and painful menstruation. Young girls will find it invigorating, and women nearing the change of life will find it a friend indeed.

This time-tried medicine contains no stimulants—it is simply a scientific blend of Indian herbs, famous for their medicinal value. Write for free circular. At your druggist's—or by mail, $1.00 per package, 6 packages $5.00. Dr. Cooniey Medical Co., Windsor, Ont.

There never was a time when people appreciated the real merits of Chamberlain's Cough Remedy more than now. This is shown by the increase in sales and voluntary testimonials from persons who have been cured by it. If you or your children are troubled with a cough or cold give it a trial and become acquainted with its good qualities. For sale by all Dealers.

Sanitation in Country Homes.

Living in the country should, of right, be the panacea against all diseases arising from impure air, impure water and adulterated or unfit food. But, population considered, there would appear to be little difference in the extent to which such diseases prevail in country or city. As says a contemporary:

"Every case of tuberculosis, city or country, proves that with pure air 40 miles deep over our heads we have chosen to breathe impure air. Every case of typhoid fever—and we cannot deny that the farm home has them—proves that the drainage from stables or outbuildings has somehow gotten into the well, or that our worst enemy, the common housefly, has washed his dirty feet in our food. Every case of diphtheria proves that filth is not far off."

Lack of ventilation in sleeping and living rooms—a superstitious dread of cold air—is probably responsible for a large majority of the cases of tuberculosis occurring on the farms. People who sleep practically out of doors—that is, with windows wide open—seldom contract tuberculosis. So long as the bed is warm, it matters little how cold the room is. The arctic traveller, ensconced in g fur sleeping bag and with no canopy but the stars, takes his rest under almost ideal conditions.

Typhoid fever will never originate on a farm if the water supply is kept pure. Such purity is assured by the driven well, sunk deep enough to be secure against the contamination of surface drainage. And it often happens that such a well is cheaper than a dug well, the security of which against seepage from barns and outhouses is always a matter of doubt unless tests have proven that the drift of contaminated under-surface waters is away from and not toward the well.

As for the housefly, the protection of the house by screens over doors and windows, and the quick removal to the fields of the manure heaps, in which it breeds, will add not only to the healthfulness but to the general comfort of the home.

Backward Children.

At the recent conference of London County Council teachers, Sir James Crichton-Browne, in a striking address, dealt with the question of backward children. Impaired nutrition, he said, was a frequent cause of temporary backwardness, and if long continued might dwarf the brain. Every brain-worker must know the dulling effect of the want of regular meals, and in children any want of nourishment was promptly reflected in a lessening of their learning capacity. For thirty years he had been proclaiming that feeding came before education, and that much backwardness in school children was attributable to insufficient nourishment during the school period.

Dried Fruits.

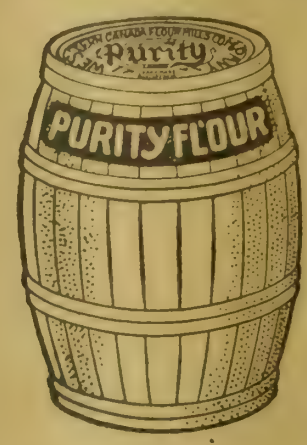
Dried apricots are of a higher food value than the fresh fruit, and stimulating to the appetite through the flavor and pretty color when properly cooked, acting also as a milk laxative. It can be used for filling for pies, for stews with sugar, for dumplings, shortcakes, and in many other ways. When stewed with sugar it makes a very excellent conserve.

Cooking dried fruit should, says the Commoner, be done in such a manner as to preserve every atom of flavor and restore it as nearly as possible to a condition resembling fresh fruits before cooking. It should be looked over carefully, removing any spotted or suspicious looking pieces, taking special pains not to leave anything that will suggest "worms"; then put the fruit into plenty of cold water, washing it quickly and thoroughly, piece by piece, if necessary; transfer to a colander, let drain, then rinse through a second water, wasting no time about it. For most of fruits, a soaking of ten to twelve hours is necessary to plump the pieces, and this should be done in a clean vessel with plenty of clean water, with a cloth covering to keep out the dust and admit the air. When soaked sufficiently, take the fruit out by handfuls and put into the cooking vessel, allow the water in which it has soaked to settle, then drain it off carefully, leaving the dregs, and pour over the fruit. Cook in this water, and if not enough, more may be added, as there should be sufficient juice on the cooked fruit to cover it. Boil gently until tender, and add any sugar or spices just a few minutes before it is to be removed from the stove. Apples, apricots, peaches, prunes, may all be prepared in this way, anh can be made very appetizing indeed. Raisins, grapes, cherries, and all dried berries are excellent treated in this way. Delicious butters can be made of the fruits by cooking as directed, then passing through a coarse sieve or colander, and stewing down until as dry as wanted, stirring either constantly, or frequently, as the fruit may call for.

CURIOSITY Prompted Many Women To Try PURITY FLOUR

THEY were curious to see exactly what results would be produced by flour *consisting entirely of the high-grade portions* of the best Western hard wheat.

They were curious to know more about a flour that contained none of the low-grade portions, which are found in every wheat berry, but which are separated and excluded from the high-grade in the process of milling PURITY FLOUR.



THEY were curious to know whether an ALL HIGH-GRADE hard wheat flour was really superior to a mixed hard and soft wheat flour.

They were curious to see and taste the kind of bread, buns, biscuits, cakes and pies PURITY FLOUR would make.

Curiosity prompts you to seek the knowledge they discovered. It's urging you to try PURITY FLOUR.

REMINDER: On account of the *extra* strength and *extra* quality of PURITY FLOUR it is necessary, for best pastry-results, to add *more* shortening than you are accustomed to use with an ordinary flour. Add *more* water when making bread.

Add PURITY FLOUR to your grocery list right now

A DAILY SERVICE BY OCEAN LIMITED EXPRESS

Commencing with the summer change of time on June 2nd, the Intercolonial Railway will put the famous through Ocean Limited Express on the route between Montreal and Halifax as a daily train leaving Montreal at 7.30 p.m. and departing from Halifax at 8.00 a.m. The "Ocean" will go on the route this season with renewed and refurnished equipment of luxurious sleeping cars, and easy riding first class coaches, and colonist cars. In point of equipment the "Ocean" is quite the equal of any of the best through trains on the continent, especially in regard to the excellence of the dining and sleeping car arrangements. Traversing a route of wonderful scenic beauty the "Ocean" enjoys a popularity with the travelling public that is annually increasing the traffic between East and West. Via the "Ocean" is the shortest, best and most comfortable route between Montreal and points along the lower St. Lawrence, New Brunswick, Nova Scotia and Prince Edward Island. The train arriving at Montreal at 7.35 a.m. enables westbound travellers to make the most convenient connections by the through train leaving Bonaventure Station daily for Ottawa, Toronto, Buffalo, Detriot, Chicago and other points.

Minards Liniment Co., Limited.

Dear Sirs,---Your MINARD'S LINIMENT is our remedy for sore throat, colds and all ordinary ailments.

It never fails to relieve and cure promptly.

CHARLES WHOOTEN.

Port Mulgrave.

It would surprise you to know of the great good that is being done by Chamberlain's Tablets. Darius Downey, of Newburg Junction, N. B., writes, "My wife has been using Chamberlain's Tablets and finds them very effectual and doing her lots of good." If you have any trouble with your stomach or bowels give them a trial. For sale by all Dealers.

FLORICULTURE.

H. A. N., Dorchester, Mass., writes asking for instructions regarding the culture of Fuchsias and Heliotrope, weather, sunlight and shade and nature of soil. Also as to the culture of Pansies as regards sunshine or shade.

The Fuchsias will do best in a partial shade in any place where they get plenty of air. They require very the Heliotropes like sun and warmth. little sunshine. On the other hand, Both plants require a rich light soil. That is, a rather sandy soil with good drainage. Give them pot room as fast as pot becomes filled with roots and spray or sprinkle the foliage of the Fuchsia occasionally, if kept where the rain will not get at it.

Pansies require a shady spot and light, well-drained soil. They are a cool weather plant and do not stand the heat well. Keep all seed pods off them and pick the flowers frequently. Do not allow the beds to become dry. Pansies like a cool shady situation with a moderate amount of moisture. The little moths on the Fuchsias can be destroyed by one or two applications of pyrelbrum insect powder dusted on lightly and washed off a few hours afterwards. Many thanks for kind words.

J. P. R., Rothesay:—Is it the best thing to do to cut off the Peaony tops as soon as the flowers fall? My Peaonies were fine last spring and I do not wish anything to go wrong with them.

Unless you wish to save seed by all means cut off the flower stalks as they only enfeeble the plants.

Last year I received several complaints of Sweet Peaonies about the shore becoming mildewed during the foggy weather. If the plants are very bad dust with finely powdered sulphur, but unless they are covered with mildew it is not necessary as the absence of fog for a few days and the warm sunshine will bring them around all right.

A. S., writes:—What shall I do with my bulbs in my beds? I want to plant my Annuals. Please write me at once.

As soon as your beds of spring blooming bulbs are done blooming cut back the foliage and plant Annuals among them.

Verbenas, Aster and Stocks do well and if the beds are covered each winter with a good mulch of coarse manure, the bulbs will not suffer much from this treatment. If, however, the soil is poor, liquid fertilizer should be given to the plants in summer after growth is fully established. All who have suitable room out of doors should either plant out or repot all needing it and plunge to the rim of pot all house plants that have been in active growth during the winter months, giving them a chance to recuperate and get strong for next winter's work. Cut back long straggling growth to keep the plants bushy and compact before planting out and most soft wooded plants such as Geraniums, etc., should be severely cut back. All seeds of tender plants can now be safely sown and if the soil is shaded from the sun in some manner until after the plants are well rooted it will give a better stand of plants.

SHERWIN-WILLIAMS PAINTS & VARNISHES

For the Farm

For an all-round metal protective paint use Sherwin-Williams Metalastic No. 2, prepared ready for the brush. Made on a graphite base with pure raw linseed oil. Dries hard and quickly and gives a durable elastic wearing surface. For sale in two colors—black or brown. Ask the local Sherwin-Williams Agent.

An Everyday Story.

Perhaps you remember the time. It was not so long ago. The papers printed much about the farmers of the West using their corn for fuel. They burned it—burned their corn—for two very good reasons. To begin with, it was cheaper than coal; and to end with, the price of corn was so low that it didn't pay to haul it to market.

In 1894, and for two years there after, corn sold in Kansas for 10 cents a bushel. In other words, a man had to raise a bushel of corn for the price of a shave. If a farmer wanted to buy a pound of binder twine, he had to sell two bushels of corn to get it.

To-day binder twine sells for about 7¼ cents a pound. And what is the price of corn? Why, corn is 65 cents a bushel.

Well, back in '94 a farmer bought a farm wagon of a Hutchinson, Kansas, dealer for $60. It was a good wagon, and the farmer took good care of it. It pays to treat a good thing well. This makes it better, and gives it long life.

The other day the farmer came back to this same Hutchinson dealer, and said he wanted to buy another wagon just like the one he got in '94.

"It was a good one," he said. "That's why I want another one just like it. How much are you going to charge me for it?"

The dealer rubbed his chin, and passed his fingers through his hair. "Well, now, let me see. It seems to me you paid $60 for that wagon, didn't you?"

"That's right," said the farmer, "$60."

"All right, that same kind of a wagon—a little better, perhaps, some improvements have been added—that wagon will cost you now $75."

"What!" exclaimed the farmer. He was surprised, and began to object, and then wanted to know the whys and the wherefores of the rise in prices.

"Well," said the dealer, "the material, like lumber and iron and steel, has gone up in price, wages have advanced—and it costs me more to buy a wagon now. Maybe the tariff has something to do with it, too."

At the mention of the word "tariff" the farmer went straight up in the air. He began to expound against the theory of the whole thing.

The dealer let him run along for a while and then asked again: "Say, when you bought that wagon from me in '94, I think you paid for it in corn, didn't you?"

"Yes—sure I did," said the farmer, "but what's that got to do with it?"

"And, let me see. Corn was 10 cents a bushel, and you had to give me 600 bushels of corn for that wagon, didn't you?" asked the dealer again.

"Yes, I guess I did," answered the farmer, after recalling in his own mind that corn was selling at only 10 cents a bushel in those days.

"I'll tell you what you do," said the dealer, "bring me in 600 bushels of corn tomorrow, and I'll give you this wagon——"

"Well, say, hold on——," began the farmer.

The dealer interrupted him in turn. "But that isn't all," he said. "In addition to the wagon, I'll let you and your wife go over to the warehouse and pick out a carriage. Then you go and help yourself to the best 6-foot self-binder in the shop. And——

"Here, wait a minute——," started the farmer.

"I'm not through yet," said the dealer. "When your wife comes in I'll let her go to the hardware department and pick out one of the best ranges we've got. And, just for good measure, you tell your wife that she can have enough kitchen utensils to refurnish her kitchen. Now, I'll give you that—all of that for 600 bushels of corn. In '94 the same amount of corn got you just the wagon. That's a fair proposition, isn't it?"

The farmer was stunned. He hemmed and hawed, removed his hat, and scratched his head.

"I'll just work this out in figures and show you what you are getting," continued the dealer. We'll put the wagon down at $75; the self-binder at $125, and that'll get you a beauty; the carriage at $125; the kitchen range at $50, and that certainly ought to be a good one; and the kitchen utensils at $15, and that ought to buy a few. Add that together and you have $390. Figure 600 bushels of corn at 65 cents a bushel and you have $390.

The farmer dug up his $75 for the wagon without saying another word, and motioned to the dealer to join him at the cigar stand for a "smoke."

There is a moral to this little story. It is that——but there, there, what's the use? You already have the moral—all of it.—International Harvester Co.

THE SARNIA FENCE CO.

SARNIA, ONT.

ROYAL FARM FENCING

Since February first of this year the Sarnia Fence Company sold direct to the farmers of Canada over 350 carloads of Royal fence.

Our enormous capacity which is the largest in the Dominion has been taxed to its utmost to fill the demand for Royal fence. We have, by working night and day, kept to our standard of shipment the same day order was received, and every order has been shipped promptly, and we are in receipt of thousands of letters from Farmers in every part of the Dominion to the effect that Royal fence is the most perfectly woven, the best wire and the best value they ever received. They tell us how many dollars they saved by purchasing direct from the factory. Don't you think you have been supporting agents long enough? Here is an opportunity for you to save for yourself dealers profits and agents commission. We know our fence is right both in perfection of weaving and quality of wire. We know that our method of direct from factory to Farmer means one third saved on your fence purchases. We are justified in offering a more liberal guarantee with our fence than is offered by any other fence company because we know our fence is better. Every bale of Royal fence is shipped with the following guarantee.

If you find for any reason that the fence received by you is not of the best wire, full government guage No. 9, the best galvanizing, the most perfectly woven fence you ever purchased at any price, you are at liberty to return it and we will pay charges both ways and refund every cent of your money."

By opposing the renual of the Steel Bounties by refusing to join the fence combine and publishing our direct to the farmer prices, we have saved the farmers of Canada many thousands of dollars. We want your support, we want your order and we want your neighbors order, and in return we will give you the best fence value in Canada. The following styles are carried in 20, 30 and 40 rod bale only, and shipment will be made same day order is received.

5-40-0 Has 5 line wires, 40-in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 10, 10, 10, 10. Price per rod 17c

6-40-0 Has 6 line wires, 40-in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 7, 7, 8, 9, 9. Price per rod 19¼c

7-40-0 Has 7 line wires, 40-in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing, 5 6, 6, 7, 7 1-2, 8 1-2. Price per rod 21¼c

8-40 Has 8 line wires, 40-in. high, 2 stays to the rod. All No. 9 hard steel wire. Spacing 3, 4, 5, 6, 7, 7, 8. Price per rod 25¼c

7-48-0 Has 7 line wires, 48-in. high, 99 stays to the rod. All No hard steel wire. Spacing 5, 6, 7, 9, 10, 11. Price per rod 22½c

8-48 Has 8 line wires, 48-in. high, 12 stays to the rod. All No. 9 hard steel wire. Spacing 4, 5, 6, 7, 8, 9, 9. Price per rod 26¾c

9-48-0 Has 9 line wires, 48-in high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 3 4 5, 5, 6, 8, 8, 9. Price per rod 26¾c

9-48 Same as 9-48-0, with 12 stays to the rod. Price per rod 29c

10-50 10 line wires, 50-in. high, 12 stays to the rod. All No. 9 hard steel wire. Spacing, 3, 3 1-4, 3 1-2, 4 3-4, 5 1-2, 6, 8, 8, 8. Price per rod 31c

Stretcher An all iron stretcher top and bottom draw very heavy single wire stretcher and spreader, freight paid with fence orders only $7.50

The above prices include freight prepaid to any railroad station in Old Ontario, south of North Bay (steamboat and electric lines not included). To points in New Ontario, Quebec, Maritime Provinces, and the Northwest, deduct two cents per rod from our printed prices, customer to pay his own freight from Sarnia.

The Sarnia Fence Company, Limited SARNIA, Ontario.

Slaughtering Pigs on the Farm.

A certain amount of skill and practice is necessary in order to dispatch a pig properly without risk of injuring the quality of the bacon. There are a number of important points to consider which if neglected all have a detrimental influence on the process. In most rural districts there will usually be found an individual who rejoices in the distinction of being an expert pig-killer. His services are in constant demand at this season of the year, although on many farms there is usually someone, maybe the farmer himself, who is quite capable of killing his own pigs. The two chief points in slaughtering are cleanliness and humane practice. No doubt the most humane method is to stun the pig first by striking it on the forehead with a heavy mallet. The animal is then killed by thrusting a long, keen knife into the throat down towards the heart, so letting out all the blood in a gushing stream.

According to some pig-killers, however, the stunning of the pig beforehand has the effect of preventing the blood running freely. Perhaps the stunning may not be necessary from the humane point of view when the pig is in the hands of an expert slaughterer, but where, as in many cases, the killing of the bacon hog is entrusted to someone who is more or less of an amateur at the business, it is certainly essential to render the animal unconscious first, otherwise there may be the pitiable sight of the pig running about the yard screaming with pain and terror until it drops from exhaustion and loss of blood. Of course, it must be remembered that a pig intended for slaughter must be given no solid food for twenty-four hours beforehand; pure water may be drunk in abundance, however, as this is said to cause the animal to scrape much more easily, while the intestines are cleaner and more tough. The state of the atmosphere is also a point to consider in slaughtering pigs; it should be such as will enable the carcass to become thoroughly cold within twenty-four hours. Beginners usually find some difficulty in inducing the doomed pig to meet its fate with resignation. The poor animal is naturally very much adverse to it, and expresses its dislike of the whole proceeding in no gentle tones. A great deal of trouble and excitement will be avoided, however, by slipping a thin, strong cord with a sliding noose over the mouth and beyond the tusks, the cord being then drawn tightly.

In the south of the country it is the usual practice to singe bacon hogs and scald porkers after killing. The singeing of the larger pigs is said to impart firmness and flavour to the bacon, and I have also found that it assists in the curing process to a much greater extent than when the skin is rendered flabby by scalding. A dry, shallow bed of clean straw must first be prepared, wisps of straw being placed between the hind and forelegs of the pig, together with a thin layer of straw over the exposed portions of the body. The straw is then set alight at the windward end, and the hairs will be quickly charred, when they can be removed by brushing the carcass lightly with a birch broom. While still hot, the hoofs may be easily dislodged by giving them a sharp twist. Great care must be taken in singeing not to blister the skin by applying too much heat to any one side of the carcass. As regards scalding, the quickest and most effective method is to thrust the carcass into a large tank or vat of water that is just boiling. As soon as it is apparent that the hair can be scraped off, the carcass should be removed to a strong "scuttling" table, where it may be scraped clean and free from hair by means of any blunt instrument or even the back of a knife.

Don't let repairs eat up your profits

Whether they represent actual cash outlay, or only the time of yourself and your help, repairs are *waste* just the same. When you make an improvement—no matter how small its cost may be—let it be *permanent*. Then it is a real investment, something on which you can realize in *cash* should you decide to sell your property; and something that will pay you constant dividends in convenience, sightliness and comfort as long as the farm remains your own.

Concrete Improvements Are Permanent

They last as long as the very hills themselves. They do not require experts to build them. Their first cost, in most cases, is no more than for inferior materials.

Aren't you interested in the subject of permanent, modern farm improvements?

Then write for the book that describes hundreds of them—

"WHAT THE FARMER CAN DO WITH CONCRETE"

It isn't a Catalogue. Every one of its 160 handsomely illustrated pages is interesting and instructive. They tell how to mix concrete, how to place it, what can be done with it. The book was printed to sell for 50 cents, but we have a copy for you, free.

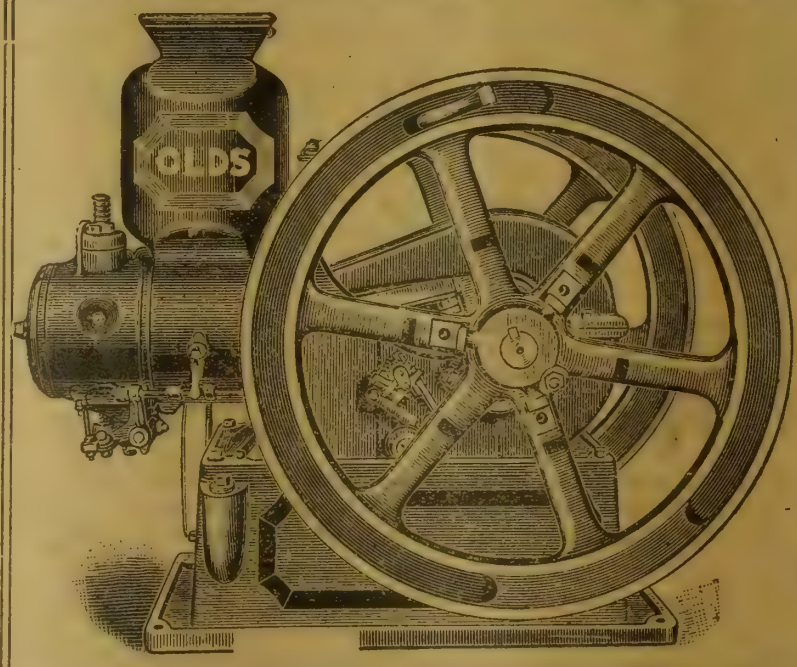
CANADA CEMENT CO., Ltd.
22-32 NATIONAL BANK BUILDING • MONTREAL, P.Q.

CANADA CEMENT COMPANY LIMITED PORTLAND CANADA CEMENT MONTREAL

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Before commencing to open the carcass, it should be hung in a clean, cool place, where a through draught of cold air can circulate. The carcass must also be washed down thoroughly with pure cold water, and any remaining hairs carefully removed. In the north it is hung to a beam or rafter so that the head is suspended about a couple of feet from the ground. The body is then opened by inserting a knife under the skin and ripping the belly open, removing the vent at the same time so that the tail is left untouched. As soon as the intestines have been removed, the liver, lungs, and heart may be brought out intact, being attached to the windpipe and other minor organs surrounding them. Then the inside of the carcass is carefully wiped out with a cloth wrung out in boiling water, after which the leaf lard is removed and placed on one side for

rendering. It is very important that the carcass should hang not less than one day in order that it may cool and stiffen properly, and the side should be propped open so that there may be a free circulation of air to assist in cooling.

Where bacon is cured for home consumption, it is immaterial to the farmer how the carcass is cut up, provided, of course, that allowance is made for the proportion of fat to lean meat in different parts of the body. Generally speaking, however, farm bacon-curers follow the practice that is customary in the district. In southern districts, for instance, the "belly-piece" is first removed so that the intestines may be more easily taken out. The Cumberland bacon-curers remove the spine in one piece, taking with it the breast-bone and the two small ribs nearest the shoulder; the ham is usually taken off at about the third joint of the spine from the tail. In the Scottish bacon factories where Ayrshire bacon is largely cured, the carcasses are skinned in the first place and the fore feet at once removed, then they are split down the middle, severing the vertabral column in two, and the separate sides are hung by means of hooks inserted through the gammon hough upon track bars. Whatever method of cutting up is adopted, it is invariably the custom to remove the head first, then the "chines" or backbone are cut out. The latter, by the way, must be removed with great care, so as not to take too great a proportion of the lean meat, for they are indeed the richest portion of the pig. The hocks and forearms may then be removed, likewise the spare ribs if the pig is a large one, and there is a large family to provide for. These spare ribs are excellent for roasting. The fillets or lean meats may also be removed from the large flitches, and the hams cut out unless the pigs are small, when they are left in. Jowls or cheeks, eye pieces, and nose pieces, tongue and ears all are cut out of the head, and not a scrap of the carcass from the head to the tail need be wasted.

Early Importations of Noted Horses to P. E. Island.

(Continued from page 578).

well known horses of which we have record, from the earliest date to the present time, but this would add too much material to a sketch already far more lengthy than was anticipated. He has therefore chosen rather to confine it to those imported prior to 1890, and which were generally regarded as the most successful sires of their day.

It will therefore fall to the lot of other and more capable writers to chronicle at some future time the achievements on the turf and at the stud of such highly successful, latter day trotting sires as "Brazilan," "Oakley Baron," and many others well known to our readers. Also recent importations of a number of very good well bred draft stallions.

In concluding this imperfect sketch, the writer would take this opportunity to again express his optimism as to the future of our horse breeding industry. He does not believe, as some pretend to do, that the day of the horse is past. Machinery will not supercede him, nor will the automobile nor tram car, though in time they may run on our public roads. The horse will live and flourish through it all as a necessary beast of burden, as a delight to the lover of this noblest of animals, and as a luxury to the wealthy. The farmer will find a horse of the right stamp and breeding a safe and sure source of revenue throughout our time.

Best Way to Use Poultry Manure.

(Continued from page 581).

A good combination for the garden is made of 1000 pounds poultry manure, 100 pounds muriate or sulphate of potash and 300 to 400 pounds acid phosphate. Of course, if kainit is used to fix the ammonia during the winter, less potash will be needed. Wood ashes are a good supplement to poultry manure, but must never be mixed with it, either on the dropping boards or after the droppings are scraped up, for they liberate the ammonia and so rob the manure of its most important element. Coal ashes do not do this to the same extent as wood ashes, but it is better not to use them. Lime, too, should be avoided for the same reason.

Poultry manure may be used to advantage in the form of manure water, being thrown into a barrel and water poured on it, or placed in a bag and allowed to soak in a barrel or bucket of water. It should be used in a weak state and to force plants. It is a good substitute for nitrate of soda and is excellent to use on house plants which need a nourishing stimulant in the course of the winter. It is also good for rejuvenating porch and window boxes which ordinarily exhaust the soil in which they are planted, to a large extent, at least, by the middle of summer.

FELL FROM A HAY LOFT

Suffered Tortures With His Kidneys Until He Tried Gin Pills

You might think that Mr. Baker needed a surgeon more than GIN PILLS. But there were no bones broken. His back was strained, which was harder to cure because nothing seemed to do any good. It is the same with a sprained ankle and broken leg. You can set the fracture and it will be well in six weeks—but the sprain may take months to get well.

However, Mr. Baker found the quick way to get relief from the pain—here are his own words.

AULTSVILLE, ONT.

A BAD FALL

"I have been a great sufferer from Kidney Trouble from an injury to my back caused by falling from a hay loft about six years ago. This left my kidneys weak, so that every cold I got would settle in my kidneys and cause intense suffering. I was advised to try GIN PILLS. I found, to my surprise, after taking two boxes, that the pains were relieved and I began to feel better. I am still taking GIN PILLS and feel sure I will be completely cured. I recommend GIN PILLS to all who suffer from any Kidney Trouble". C. BAKER.

You see, the fall had strained the kidneys and they were affected by the slightest chill. GIN PILLS immediately strengthened the kidneys—soothed any irritation and thus enabled the kidneys to overcome the effects of the fall.

If you are having pain in the back—or trouble with kidneys or bladder through accident or overwork—do just as Mr. Baker did—take GIN PILLS. They will help you—cure you—or we will promptly refund your money Buy six boxes at your dealer's. If, after taking them, you feel that Gin Pills have not helped you, return the empty boxes and get your money. We will take your word for it. 50c. a box, 6 for $2.50. Sample box sent free if you write National Drug and Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS regulate the bowels and cure Constipation, Biliousness and Indigestion. 25c. a box. 111

Lice.

G. S.:—Will you kindly advise me through your paper the best method of getting rid of lice in the dairy and barn. Of course our climate is very severe in winter here. It will not do to spray our cows and even if they are thoroughly washed, they stand a certain amount of danger in contracting cold.

Stable and cattle have to be perfectly free of lice in fall and then will stay free in winter. Lice mostly infest dark, badly ventilated damp stables. Put in a ventilating system and four square feet of window glass for each cow. Clean up, fumigate, disinfect and whitewash the stable to rid it of lice. Kill lice on cattle by applying a decoction of one ounce of stavesacre seeds to a quart of boiling water used cold.

Cream Separator Facts Worth Knowing

THERE are *six* important things a cream separator should do in order to be a paying investment.

FIRST: It should get *all* the cream.
SECOND: It should get the cream in *perfect condition.*
THIRD: It should *save* you money.
FOURTH: It should *save* you work.
FIFTH: It should be *durable.*
SIXTH: It should *make money* for you.

There are a host of machines that are claimed to do these six things. But Empire separators are the only separators actually doing the whole six. That's certainly a bold statement. It's the truth, nevertheless.

Frictionless Empire

FIRST: Empire Cream Separators skim to .02 per cent. and often less. That means the loss of only one pound of butter fat in every five thousand pounds of milk, which is equal to the loss of one pound of butter fat in all the milk a cow gives in one year. The Frictionless Empire *gets all the cream*

EMPIRE

Cream Separators

SECOND: The few smooth-skimming devices of Empire separators are as easily and thoroughly washed as glass tumblers. This cannot truthfully be said of skimming devices with corners, sloths and crevices that soon get clogged up and cannot be thoroughly cleaned. *Cream in perfect condition* —cream without a taint—can only be obtained from a separator that can be thoroughly cleaned.

THIRD: Empire separators get thirty per cent. more cream than old style methods. *The more cream saved the more money saved.*
FOURTH: Empire separators do the skimming in a fraction of the time required with old style methods. *They save many hours of work.*
FIFTH: You can judge the durability of Empire separators when we tell you that the average cost per machine has been less than thirty cents a year for repairs during ten to fifteen years of service.

SIXTH: Empire Cream Separators get thirty per cent more cream than old methods. The cream is first quality—commands a higher price than gravity cream. More cream and higher price cream necessarily mean more money. The Empire will give you enough more profit than a cheap separator to pay for itself in two years. No other separators will fulfill all these six requirements. They cannot do so because they cannot use the Empire patented devices and mechanism.

Empire Disc.

These patented features are found only in the Frictionless Empire cone method and Empire Disc. Wherever you choose you are bound to be satisfied. Every Empire Separator is sold under a binding guarantee —a *guarantee as good as a gold bond.*

Write for a copy of our latest catalog. It describes both machines completely and is handsomely illustrated.

AGENTS EVERYWHERE IN CANADA—LOOK FOR THE EMPIRE SIGN 35

Disinfecting the Stable.

One might, at first glance, wonder what this subject has to do with the health of human beings, but as we study the subject we find much—very much. The many diseases that come to us direct from the stable are typhoid fever, through the breeding of flies; anthrax, tuberculosis and glanders. There are others, but of these you know, and they alone justify sanitary conditions in the stable.

A dark, damp basement barn, where sunlight can not freely enter, is a very unsanitary place at best, even though it is disinfected several times per year. As a matter of fact, such stables should be disinfected monthly. A few hours' work on a rainy day, or, better still, when the sun is shining brightly, means a very small expense and you are conserving not only the health and strength of your horses and cattle, but of your family and the families of those who purchase your milk or butter, your eggs, poultry, mutton, pork, veal or beef. Instead of a possibility of diseased products, you have the consciousness of pure, clean, healthy material for your own table as well as the tables of your patrons.

Sunlight is the greatest and best natural disinfectant, but there are places in every stable where the sunlight does not reach and these must be disinfected by artificial means. There are many drugs which have the power to destroy the organisms of disease. They are known as disinfectants. Some of them are dangerous to the user and to the animals intended to be protected and, although they are all named and their action described in the scientific works for practical purposes, I will recommend only one because the results of its use have demonstrated that it does the work in a perfectly satisfactory manner, is cheap, safe to handle and not harmful to animals.

Among those frequently recommended are bichloride of mercury, chloride of lime, formaldehyde, carbolic acid, crude carbolic acid, cresol, and compound solution of cresol. The last named is quoted by the United States Pharmacopoeia as an official preparation and, as it has all of the disinfecting qualities of the others and is safe in every way, it is useless to seek further for an agent. A common barrel spraying pump, such as all farmers should be equipped with for orchard spraying, is the simplest and most economical apparatus.

Before beginning the use of a disinfectant it is essential that certain preliminary work be done in and about the stable that is to be treated. The various surfaces, such as ceiling, walls, partitions and floors, should be swept until free from cobwebs and dust. Any accumulation of filth should be removed by scraping. In some cases the woodwork may have become softened and so porous as to be a good medium for the absorption of disease germs. Such woodwork should be removed, burned and replaced with new material. All refuse and manure from stable and barnyard, known to be infected, should be removed to a place inaccessible to live stock and, if possible, be burned or thoroughly mixed with a solution of chloride of lime in the proportion of six ounces to one gallon of water. If the floor is of earth, it will doubtless have become stained with urine and contaminated to a depth of several inches. In such cases four inches or more of the surface soil should be removed and treated as above suggested for refuse and excreta. All earth removed should be replaced with soil from an uncontaminated source, or better, a new floor of concrete may be laid, this being the most durable and sanitary material for the purpose.

All things considered it is probable that compound solution of cresol, already mentioned, is best for all purposes. It should be used in the proportion of four or five ounces to each gallon of water. As an accessory preparation and for use after the application of the disinfectant, it may be advisable to make ready a lime wash to each gallon of which there has been added four ounces of chloride of lime, or if it appears desirable to use the disinfectant and lime wash at one application, the following method may be followed in preparing five gallons: Slake seven and one-half pounds of lime, using hot water if necessary to start action. Mix to a creamy consistency with water. In case compound solution of cresol is used, add 30 fluid ounces to the lime wash. Stir thoroughly. If to be applied through a sieve. Stir frequently when applying and keep covered when not in use. spray nozzle, strain through a wire In case a large surface is to be disinfected it will be advisable to prepare a liberal amount of the disinfecting solution before beginning the application. Such solutions, however, should not be permitted to remain in receptacles which are accessible to animals.

The efficacy and economy of the work will depend in a great measure upon the method of applying the disinfectant. Economy requires that the disinfecting solution be applied rapidly; efficiency requires that it be not only spread in such manner as to cover the entire surface requiring disinfection, but that sufficient quantity and force be used to drive the solution into all cracks and crevices. Where a very limited surface is to be treated, as, for example, one stall, it may be possible to apply the disinfectant in a satisfactory manner by means of a whitewash brush. In all cases, however, the best method of applying the disinfectant and the lime wash is by means of a strong spray pump. Such should be equipped with not less than 15 feet of hose, to which may be attached a five-foot section of iron pipe of the same caliber. With a spraying nozzle at the end of the pipe the operator will be enabled to proceed with the greatest possible

dispatch and the least possible inconvenience.

The entire interior of the stable should be saturated with the disinfectant. Special attention should be given to the feeding troughs and drains. After this has dried, the surface may be sprayed with lime wash, and when this process has been completed it will be advisable to open all doors and windows of the building for the admission of air and light.—Kimball's Dairy Farmer.

Ventilate The Barn.

Farmers who are going to build barns next summer should make arrangements now to put in the King system of ventilation in their stables. It is not expeusive if you make calculations in time.

The Washington Agricultural College has the following to say on the necessity of such ventilation.

Dairy barns are very frequently poorly ventilated. The dairy cow is then not only required to live but to work, under unfavorable influences and she often falls a victim to such diseases as tuberculosis, pneumonia, bronchitis and colds. Foul air is one of the prime factors in the production of such diseases, Since the advent of sanitary science in connection with ventilation the air space allowed for each animal has been increased, and a number of methods of ventilation have been devised. The exercise of a little care in such matters will protect the health of animals, prevent premature death,and also make possible the highest working efficiency of the herd.

World's Production of Wheat.

Final estimates of the production of wheat in 1911 have been received by the Institute from all the important countries. The total production in the Northern Hemisphere is 3,154, 360,000 bushels against 3,185,565,000 in 1910, a decrease of 31,205,000 bushels. The exceptional decrease of 266,000,000 bushels in Russia was almost balanced by large increases in Canada and in most of the countries of Europe. The total for the Southern Hemisphere (preliminary estimate) is 290,988,000 compared with 275,810,000 in 1910. This makes the world's total, according to the Institute 3,445,348,000 bushels as against 4,471,375,000 produced by the same countries in 1910. Adding the production of a number of smaller countries as given by Dornbusch we have 3,568,148,000 bushels for 1911 against 3,575,375 for 1910. The world's total for 1910 according to Broomhall is 3,451,972,000 bushels, according to Beerbohm, 3,456,000, 000.

OTHER CEREALS IN 1911 AS REPORTED BY THE INSTITUTE.

The total production of Rye in the Northern Hemisphere was 1,574,633, 000 bushels against 1,660,469,000 in 1910 ; Barley 1,377,746,000 against 1,377,388,000 ; Oats 3,655,650,000 against 4,003,261,000 ; Corn 3,181, 133,000 against 3,550 786,000.

The production of Oats in Argentina is estimated at 57,255,000 bushels against 34,337,000 in the previous year; New Zealand 17,597,000, against 11'578,000. The Argentina corn crop is 275,577,000 bushels against 27,558,000 last year when most of the area was abandoned.

THE 1912 WHEAT CROP OF INDIA.

The wheat harvest will begin in Central India in March, in Upper India in April and will be completed in May. A complete estimate of the acreage to be harvested this spring has not been made, but figures received from the Institute referring to about 89% of the wheat regions, give the acreage for these regions as 25, 570, 000; acres or 99 per cent. of the acreage of the same regions last year. The total area harvested in1911 was 29,970,000 acres, and the production was 370,414,000 bushels. According to Broomhall's latest report the outlook for the crop about to be harvested is very good and a bumper yield is expected.

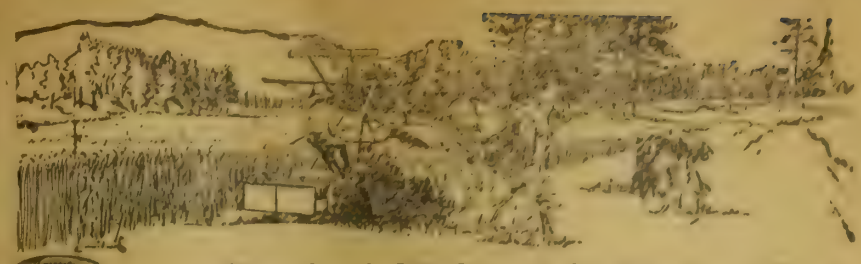
Garget.

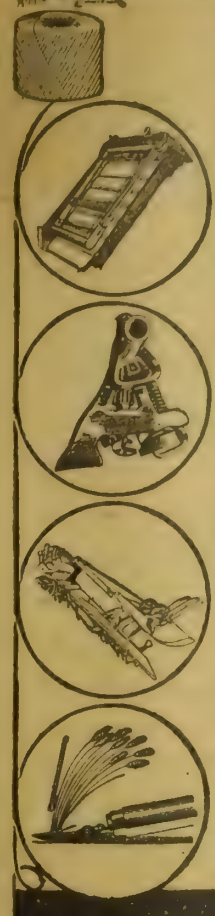
J. B.:—I have a Guernsey cow that has a swollen bag, that is, the two hind teats. At first she would give some milk and now she doesn't give a cupful out of these two teats, although she was a good milker last year.

"Garget" is merely the popular term for mammitis or inflammation of the udder in any one of its several forms. Your cow has had a bad attack of mammitis (garget) at some time or another, or possibly she has tuberculosis of the udder. Anyhow she will never prove profitable in the dairy and if she is free from tuberculosis it would be best to sell her to the dealer for slaughter, or to fatten her off for slaughter.

Whitewash Recipe.

Take a half bushel of unslaked lime, slake it with boiling water, cover it during the process to keep in steam, strain the liquor through a fine sieve or strainer and add it to a peck of salt, previously dissolved in warm water, three pints of ground rice boiled to a thin paste and stir in while hot. Add five gallons of hot water to the mixture, stir well and let stand a few days, covered as nearly air tight as possible. It can be colored by adding ochre, lamp black, ground keel or bluing to suit.





Proof of McCormick Binder Merit

FARMERS who know the McCormick binder best are its best friends. McCormick machines have been giving satisfactory service for over seventy years, with a constant increase in the number of sales, proving that the binder has unusual merits and gives satisfactory service.

The McCormick binder harvests successfully grain that is short or tall, standing, down, or tangled, or full of green undergrowth. It is built to last and has every necessary adjustment to keep it working up to full capacity. The reel can be adjusted high or low. The platform can be tilted to cut close to the ground, to pick up down or tangled grain without pushing trash ahead of the knife, because the bottoms of the guards are nearly level with the bottom of the platform. The third packer pulls down the grain from the top of the elevator. The third discharge arm keeps the bound sheaves clear of unbound grain. The floating elevator does not clog. The McCormick agent will show you how well the McCormick improved knotter works without close adjustment. Either smooth section or serrated knives can be used in the cutter bar.

Eastern Canadian farmers will appreciate these features when the McCormick binder is put to work in their fields. The local agent will show you the many good features of McCormick harvesting and haying machines and tools. You can get catalogues from him or by writing the nearest branch house.

Air and Fertility.

(Continued from page 579).

given at 11 a. m., and still another at 2 p. m. At the latter turning, most of the material was in condition to pass through a screen with mesh three-sevenths of an inch in size. In this way all the lumps were caught, and were then chopped into minute pieces. At 5 P. M. another turning and screening was given, and at 7 P. M. the whole mass passed easily through the screen. There was no odor; that is, none of the original odor; only a faint, wholesome smell of rich soil. The bacteria in the mellow garden soil, aided by the air, had done the work in a complete manner.

This particular experiment was made under exceptional circumstances, during a long, hot, July day. Usually the end in view required three to seven days; partly because of less frequent turning. In fact, I usually turned and aired the mass only once a day.

Night soil is one of the most neglected of all the natural plant foods, and yet when properly treated it is one of the most valuable. This is evidently true when one reflects that human foods are highly nitrogenous in character. The theoretical yearly value of human excreta is something like $7.50 per annum. Whatever may be said of the so-called bad effects on vegetation produced by night soil in its ordinary raw, lumpy condition, or after months of air-tight storage, there seems to be nothing whatever against it when properly composted with air and screened loam. On the other hand, there is good reason to regard it as one of the best and most truly valuable by-products of the farm, and quite as effective and available as any of the fertilizers.

My excuse for alluding to night soil, and commenting upon it, is that it so well illustrated the idea on which this article is based, for no other manure is naturally so impervious to the air as this one. In its behavior, as commonly stored and treated, it resembles a bit of wet marsh land; full of plant food, but wholly unavailable until supplied with air.

CONCLUSIONS.

The general conclusions are obvious. Air is neither a direct nor an indirect fertilizer, as commonly understood; and yet it is both. A steel-tooth cultivator is not a dung cart, yet it adds vast amounts of plant food to the supply previously available in the soil.

When a farmer or gardener examines a soil chart, and finds the amazingly large amounts of nitrogen, phosphoric acid and potash already present in his own soil, and in all good soils everywhere, he is sure to ask whether it is not possible to use at least a part of what already belongs to him, instead of depending wholly on commercial articles to piece out his stable manure.

It somehow reminds one of the story about acres af diamonds; how the young man started out to explore the world for precious gems, and how he returned home, late in life, to learn that his own birthplace was in a rich diamond-producing belt.

It is much the same with our soils. On every farm there are tons of the very elements sold by the fertilizer manufacturers; the home products not always in readily soluble forms, but almost always in such shape that tillage will release them.

It will presumably pay, in all cases, to add stable manure and fertilizers to every sort of land, but those farmers will succeed best who till most thoroughly, and who thus unlock their own storehouses of fertility.

No writer or lecturer can "ring the changes" too much on this matter of developing the latent, inexhaustible fertility of the soil. It is not extravagant, but to speak of a cultivator or harrow as one of the greatest fertility producers in the world.

The Blackhaw Treatment for Mares.

"Last year I had some trouble with mares slipping their foals. What is the black haw treatment for preventing abortion?"—J. G. M.

The blackhaw treatment for mares inclined to abort has been frequently described in our veterinary columns. By its use mares which have repeatedly slipped their foals have been brought successfully through the entire natural period of pregnancy. The treatment should be begun just before the time of pregnancy at which the accident has usually occurred, or immediately upon recurrence of the first preliminary symptoms of restlessness.

The treatment consists in giving the mare half an ounce of fluid extract of blackhaw and 20 drops of pure carbolic acid in water every other night. At the slightest sign of impending abortion place the mare in a secluded stall and give this mixture daily, and add half an ounce of fluid extract of Cannabis indica if the mare is restless, shows pain or strains. When the latter symptoms are seen, the blackhaw may be given twice a day until the symptoms subside.

VEGETABLES—Carrots, 60c. bus.; Potatoes, Blues, 50c. to 55c.; Reds, 55c. to 60c.; Turnips, 20c. to 25c. Beets, 60c.; Parsnips, $1.50 per 100 lbs.

Since last report spring has opened up and business is brisk. Shipping has been brisk and a lot of produce has been shipped, and large consignments of goods have been received, every boat that has called here this spring having full cargoes both in and out. Potatoes are lower and the demand at the moment is quiet, but we think that prices will hold around present level. Other vegetables have been very scarce and the demand much heavier than the supply. Butter is lower and still further decline is expected. Eggs have held at about the same prices and the prices paid are certainly away beyond what dealers expected and are record prices for this season of the year. Cheese is about out of the market and there will be nothing to offer for shipment until the new cheese is ready. Grain feeds of all kinds are scarce and prices high.

Fattening Poultry.

The method used by most of the large establishments engaged in fattening poultry in this country is to feed the chickens in crates from troughs, according to information collected by the United States Department of Agriculture. From six to 10 birds are placed in each division of the battery or feeding coop, depending on the size of the birds and the ideas of the feeder. Two or three chickens do better in a division together than when only one bird is placed in each compartment, and the cost of equipment and labor per bird varies inversely with the number of birds in each division. Another method which is used to a considerable extent on a small scale in this country is pen fattening. This method is adapted for use on the farm where the farmer does not care to go to the trouble of crate fattening, or where the price received for well-fed birds does not warrant the extra labor and feed cost of the crate method.

Most "milk-fed" chickens are fed for fourteen days, but results indicate that a more profitable gain can be secured in a shorter feeding period, provided the same price per pound can be obtained for the finished product. Practically all of the special feeding in this country involves the use of milk, thus producing "milk-fed" chickens. Milk, while the least expensive, seems to be the most essential constituent of the ration, and when a feeder cannot get milk in some form he generally does not attempt to fatten poultry commercially. Fresh butter milk, condensed butter milk, and skim milk are preferred in this relative order. The feed is mixed to the consistency of thick cream, or so that it will drip from the tip of a wooden spoon. Rations of 50 percent. cornmeal, 40 percent. low-grade wheat flour, and 10 percent. fine shorts; or of 58 percent. cornmeal, 36 percent. oat flour, and 6 percent tallow, by weight, give very good results, producing gains which cost from 6.45 cents to 7.74 cents per pound. Low-grade wheat flour is a more economical feed than oat flour at the present prices of grain.

We employ hit-or-miss methods in the place of system about the farm and are soon "in the hole," till there is no hope of ever digging out, when systematic effort would put us on top of good soil, with both feet on a firm footing.

An I H C Gasoline Engine Will Pay You Best

IF you really want your money's worth when you buy a gasoline engine, buy an I H C with plenty of power to do your work.

A gas engine that is not well designed, that is built roughly or of inferior material, is worse than none at all. It costs almost as much as a good engine to begin with, and costs much more afterward in repairs and loss of time.

Buy a reliable I H C engine and save yourself an endless amount of worry, lost time, money, and temper.

I H C Gasoline Engines

are simple, dependable, durable. The carburetor or gasoline mixer is the simplest and most effective known. Anyone can regulate it perfectly. Ignition is positive. The ignition apparatus is so simple you can understand it at a glance. The fine-grained, grey, cast iron cylinders and pistons are worked together to a perfect fit. The ground piston rings insure maximum power from the explosion.

All moving parts are perfectly balanced. The bearings are unusually large and carefully fitted. Every part is amply strong and no part is too heavy to be most efficient. In every detail, the I H C is a good engine—one you can depend upon for years to do your work when you want it done.

I H C engines are made in all styles—vertical and horizontal, portable and stationary, air and water-cooled; in sizes from 1 to 50-horse power, to operate on gas, gasoline, naphtha, distillate, kerosene or acohol. Gasoline and kerosene tractors, 12 to 45-H. P. Grinding, sawing, pumping, and spraying outfits, etc.

The I H C local agent will show you the good points of the I H C engine. Get catalogue from him, or, write the nearest branch house.

Seed Growers' Association.

Some important changes in the regulations of the Canadian Seed Growers' Association, in regard to the selection and registration of seed, were made at the annual meeting of the association held in Ottawa, February 8th and 9th. The sections relating to the definition of terms and the registration of seed were changed to simplify the system of selection and registration, provide for the production of a much larger amount of registered seed and maintain or raise the standard for registration by a more thorough system of inspection. Under the new regulations there will be two main classes of seed eligible for registration: (1) "Elite Stock Seed", which is the general product of the hand-selected seed plot of at least three years' satisfactory selection, or a pure stock of seed originating from a single plant or seeds the progeny of which has proved in field tests and other means of examination to be worthy of distribution, and (2) "Registered Seed", which is the product of Elite Stock Seed up to and including the third generation.

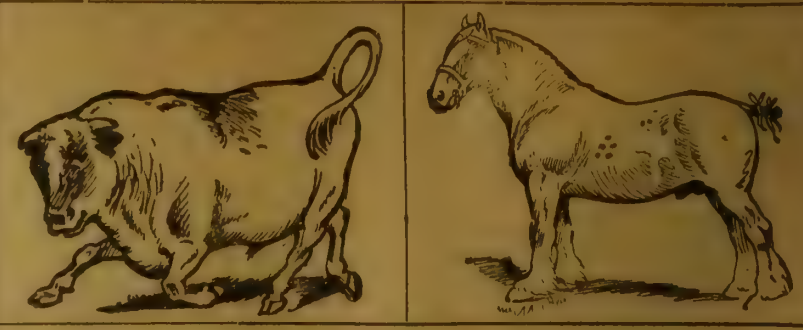
Elite Stock Seed corresponds to what was previously known as "improved" seed, and it is hoped that the association will be able to provide facilities whereby applicants for membership may obtain a quantity of this seed or the progeny thereof not further removed than that of the first generation. Such seed will be obtainable to devote all the available area or from members of the association. Applicants are advised to procure sufficient to sow at least a one-quarter acre seed plot. By starting with "Elite Stock Seed" or "Registered Seed" of recognised quality a grower will save the three years of hand selection which are necessary to produce the Elite Stock Seed by selecting from an ordinary unimproved variety. The period during which seed descended from hand-selected stock is eligible for registration is extended two generations, which should greatly increase the amount of Registered Seed available, as even members with large farms will be able to devote all the available grea to the production of Registered Seed; or they can have it grown by other farmers under their supervision. Any danger of lowering the standard that might have arisen through extending the period for registration is met by the new system which has been adopted for the inspection and sealing of sacks. Up to the present inspection has been confined to the field plots, but in future not only the standing crops but the threshed grain will be inspected, and that which comes up to the standard of quality fixed by the association for Registered Seed will be sealed in the bag and a tag bearing a number corresponding with that of the certificate of registration attached. In this way the quality and identity of Registered Seed will be guaranteed, and the interests of both the grower and the purchaser will be protected. After some discussion it was decided that for this year at least only seed that is grown by members should be accepted as eligible for the registration seal of the association. That is, if a non-member purchased Registered Seed for the first or second generation removed from Elite Stock Seed the association will not recognize the product of this seed as Registered Seed and seal it, even though it complies with the standard of quality. It was thought best to restrict for the present the privilege of registration to members of the association who had operated a seed plot for at least one year and had been favorably reported upon by the inspectors.

With the object of getting more reliable information regarding the suitability of varieties for different districts, two committees were appointed, one for eastern Canada and one for western Canada, each consisting of the superintendents of the experimental farms under the Dominion Department of Agriculture, the district officers of the Seed Branch, and the agronomists of the agricultural colleges, to make recommendations to the association regarding the value and suitability of different varieties. The evils resulting from growing a large number of varieties, many of them new and untried, were recognized, and an attempt will be made to restrict the operations of the members to standard varieties that have been tested and are known to be suitable to the conditions under which they are to be grown. The principle of conducting trial plots when necessary to get information to supplement that collected by the committees was approved.

The results of the investigation regarding the suitability of the grain crop of western Canada for seed purposes have been published in a bulletin entitled "The Seed Supply, 1912, Manitoba, Saskatchewan and Alberta", 20,000 copies of which have been distributed. The bulletin contains a summary of the inspection reports up to the first week in January. Conditions in each of the prairie provinces are summarized, and a more detailed statement is given according to federal electoral districts. The report indicates that there are large areas in both Saskatchewan and Alberta where the settlers are without seed or the means of obtaining it. This applies almost entirely to those districts which have been very recently broken up and the settlers are not in a position financially to meet the situation. There is plenty of good clean seed available if arrangements can be made for having it distributed.

Standard samples of seed representing the minimum standards of quality on account of general appearance that will be recognised in seed testing and seed inspection work this season have been made up and distributed to seed merchants. These samples represent the standards for No. 1 and No. 2 timothy, red clover and alsike seed apart from the standards of weed seed content defined by the Seed Control Act. There are no standards as the minimum standards are fixed for general appearance for No. 3 seed, by the weed seed content only. For this season two standards for No. 1 timothy seed are recognised, the regular No. 1 and No. 1 American Standard. Owing to the abnormal conditions which prevailed last season over the timothy seed producing area tributary to Chicago and the resulting low general quality of the seed, it was decided to recognise for this year No. 1 American Standard for seed that contains even a considerably larger proportion of hulled seed than the regular No. 1 grade allows, but which complies with the No. 1 standard in regard to freedom from inert matter and other impurities.

There has been this season a large increase in seed testing work, both for purity and germination. Up to date 3,830 samples have been received from seed merchants and farmers at the Ottawa seed laboratory, and in addition to these 1,350 samples have been received for germination test in connection with the seed supply investigation, making a total of 5,180 samples since September 1, 1911, compared with 2,349 for the same period last season, an increase of 83 p.c. At the Calgary seed laboratory the proportionate increase has been much greater. During January 2,001 samples were received, compared with 135 tested the same month last year and 1,281 received during the whole year ended March 31, 1911. The increase is almost entirely due to the seed supply investigation and the samples sent for germination test by farmers in the frosted areas. During January 1,421 samples were received at the Ottawa seed laboratory from



What Do You Feed Your Animals?

Have you seriously considered the question of returns for your good money spent buying Middlings, Bran, Cornmeal, etc., at the present high prices?

But, you say, what shall I feed to get good results? The answer is MOLASSINE MEAL. If you have not used MOLASSINE MEAL, you do not know of its good qualities. You have undoubtedly heard of it. Actual experience brings conviction. Buy some TO-DAY and see the result on your HORSES, CATTLE, PIGS, SHEEP and POULTRY.

MOLASSINE MEAL is made in England, of Pure Cane Molasses and the best that Mother Nature can produce in the way of a Vegetable Product which neturalizes the effect that Molasses, in its ordinary state has on the stomach of all Animals.

If your dealer cannot supply you, please write us and we will tell you how to obtain better results by feeding MOLASSINE MEAL.

Have you talked with your neighbors about subscribing for THE MARITIME FARMER? Why not do it now? Make up as large a club of subsbribers as you can and send them in.

seed merchants and farmers and of these 478 were cereals mostly for germination test only. The samples graded under the Seed Control Act were as follows: Red Clover, Ex. No. 1, 1; No. 1, 41; No. 2, 97; No. 3, 95; rejected, 52; total, 286. Alsike No. 1, 14; No. 2, 46; No. 3, 83; rejected, 41; total 184. Timothy, No. 1, 46; No. 2, 77; No. 3, 85; rejected, 87; total, 295. Alfalfa, Ex. No. 1, 2; No. 1, 8; No. 2, 21 No. 3, 10; rejected, 2; total, 43. Less than seven per cent. of these samples were sent in by farmers. Quite a large proportion of the samples from seed merchants represent farmers' lots of uncleaned or poorly cleaned seed, and many of these that grade No. 3 or rejected may be re-cleaned sufficiently to grade higher.—Geo. H. Clark, Seed Commissioner.

Pasture For Hogs.

In regard to pasturing hogs, the extension lecturers of the experiment stations, state that the man who gets the best results from pasture is usually raising good hogs, selecting his pasture crops carefully, insisting on a good stand of grass, furnishing plenty of succulent juicy pasture throughout the summer, and feeding some grain to pigs from birth to market.

Under these conditions the cheapest pork produced is made on pasture. The pasture itself should be convenient to the permanent yards or house, and well prepared. A good small pasture is worth much more than a large one full of weeds. In some sections clover is probably the best pasture grass for hogs. Rye or rye and vetch make excellent spring pasture. Oats and field peas are good. White clover gives good results in many places. Field peas are an excellent crop for finishing off the hogs in late summer.

At no time should hogs have the entire run of a large pasture. One may confine them within movable or hurdle fences, giving them access to a part of the field at a time. Such fences are not expensive. They save much waste of grass, secure a larger growth of feed from the land and the hogs make more rapid gains.

It is important that some grain be fed pigs intended for the market It is usually cheaper to feed a little grain all the time than run the pigs on pasture alone during the summer and finish with grain in the fall. On pasture alone a hog gains very slowly. With but a little grain in addition he will do well. For satisfactory gains a hog should receive 2 pounds of grain daily for every 100 pounds live weight. However, if grain costs $30 per ton it may be more profitable to feed as little as 1 pound per day. Hogs need the best possible pasture. One must make the pig use as much grass as he can with profit, and feed as much grain as the price will permit. The gains made on pasture should cost from 10 to 20 per cent. less than under other conditions.

Carelessness is a prominent characteristic of almost every farmer, and accounts for many failures in this line of work.

Debts are carelessly contracted when there isn't a dollar in sight, and no prospect of any; then when pay day comes we are just as much poorer as the size of these debts.

Another careless and unnecessary trick is that of carrying money around the farm while at work. We are in such a variety of shapes and positions that we are liable to lose everything from our pockets.

MAXWELL'S

HIGH SPEED CHAMPION

Easiest running and most satisfactory washing machine made in Canada. Can be worked with side crank as well as top lever. Red Cypress Tub and the whole top opens up. Wash day is the easiest day of the week when you wash with the Maxwell "High Speed" Champion.

JEWEL FOOD CUTTER

is just what you need for your kitchen. So much easier, quicker and more convenient than cutting up meat, etc., with a knife.

"Jewel" is superior in every way to imported food choppers, and being made in Canada, costs less.

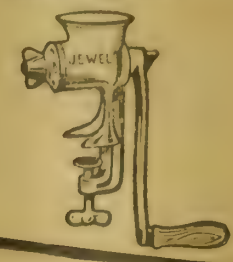
FAVORITE CHURN

makes the most delicious butter you ever tasted. It's [illegible] quality" butter—that real pleasure to eat.

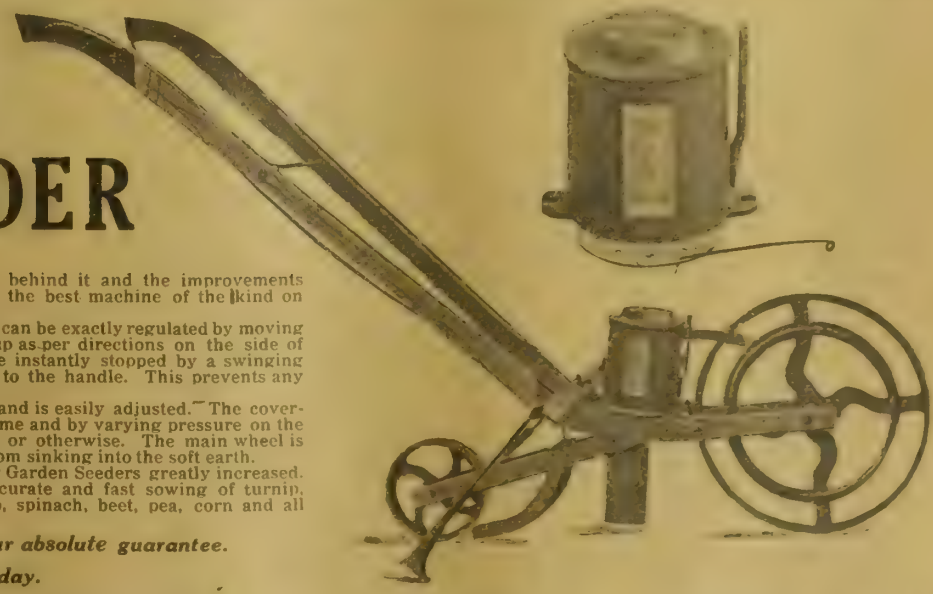
Both hand and foot power and roller bearings enable a child to churn with the "Favorite". All sizes from ½ to 10 gallons.

Write us for Catalogues, if your dealer does not handle these household necessities.

DAVID MAXWELL & SONS
ST. MARYS, Ont.



GARDEN SEEDER



Our Seeder has years of success behind it and the improvements recently added, makes it without doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. The flow of seed can be instantly stopped by a swinging cut-off operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our Garden Seeders greatly increased. No better seeder can be built for accurate and fast sowing of turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seed.

Every machine carries our absolute guarantee.

Send us your orders today.

The Sussex Manufacturing Co. Limited, Sussex, N. B.

The Celebrated Hallock Weeder

Makes fine dust mulch, insuring quick and sure catch of the seed.

The Cultivator which will do work in wet or dry weather. By its use moisture is retained in the ground where needed. Cuts no roots, kills the weeds, cultivates close up to the row, and over the row. In fact, everywhere—where cultivation is needed.

The Best Weeder on the Market.

And last, but not least, does two or three times as much work as any other style of Cultivator in same or even less time.

There is only one rule to follow in the use of our Weeders--use them early and often. Don't give the weeds a chance to grow.

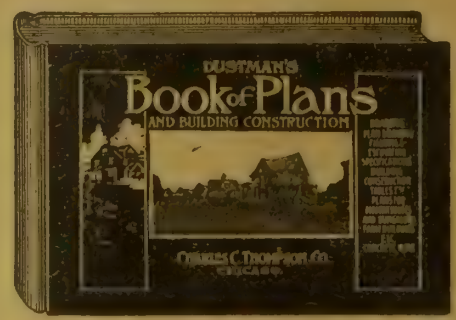
Dustman's Book of Plans



—AND—

BUILDING CONSTRUCTION

By U. M. DUSTMAN
(Licensed Architect)

10,000 Sold in 30 days

Price, $2.00 Prepaid.

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an anthority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs Writing of Specifications.

This book will be sent, together with a year's subscription to The Maritime Farmer, to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscripton. If you are not already a subscriber and want the book, you may obtain it and The Maritime Farmer for $2.00. These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

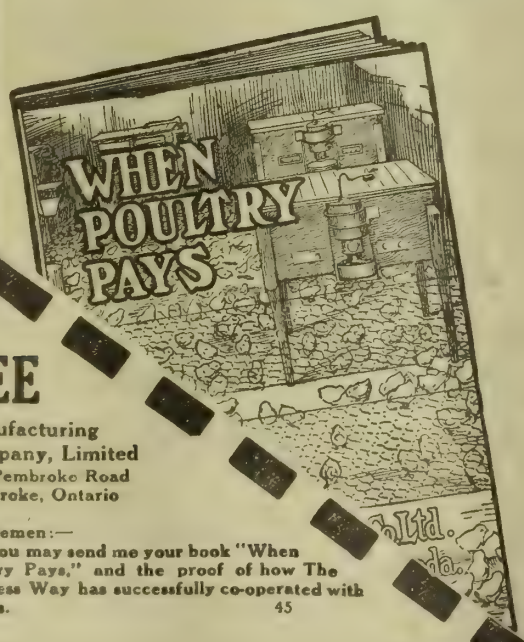
THE PEERLESS INCUBATOR AND THE PEERLESS WAY HAVE DOUBLED THE PROFITS OF 20,846 POULTRYMEN

ANY farmer can raise "poultry-for-profit" on the same plan and under the same conditions as we do it at the Poultry Yards of Canada, Limited, and make just as big a success as we have made of this, the largest and most profitable poultry farm in the Dominion. You can do it. You can put to work for you The Peerless Way and the Peerless Incubator and double or treble your profits right from your first month. Over 20,846 Canadian poultrymen have proven this. By following our system, they are making their poultry pay them greater profits than they ever dreamed were in the business.

THE book, "When Poultry Pays," tells what hundreds of followers of The Peerless Way have accomplished. It tells why the price of eggs doubled in seven years; it tells about a market that exceeds the supply by 200%—a market you can help supply at constantly rising prices; it tells about a plan that is more than merely a system of poultry raising—a plan that raises poultry **at a profit;** it tells about co-operative marketing—how the highest prices are secured in either large or small quantities; and, by no means least, it tells you exactly how to get started in this field of profits that lies right at your door.

Send For This Book— FREE For The Coupon



Remember, we will not send you this book unless you ask for it. "When Poultry Pays," illustrated throughout, has cost a good deal of money to produce and you will have to signify by asking that you are interested. Do not send for it with the idea that it offers any "get-rich-quick" plan, however; but if you have just a little money, a fair amount of horse-sense and a willingness to follow the advice of experts and look after your business, you can double your profits from the start. Indeed, if you will work just a little harder, you can treble them. If you want the book

Gentlemen:—
You may send me your book "When Poultry Pays," and the proof of how The Peerless Way has successfully co-operated with others. 45

Name .....

Address .....

Town ..... Province .....

We Will Show You How To Raise At A Profit.

THE Peerless Way, more than merely a system for raising poultry, will show you how to raise at a profit. Our Poultry Advisory Board sees to it that no followers of our methods ever fail. They give advice, counsel and detailed instructions in every step—from starting to marketing. Our 20,846 successful followers can testify to this—and many of them do so in our book.

We Will Show You How To Get Better Prices.

THIS alone is a valuable part of the service included in The Peerless Way. We guarantee to find, for all your poultry products, buyers who will pay you the highest spot-cash prices and who will charge you no commission for the service either. You do not need to be dependent upon the middleman and cold-storage buyer when you understand co-operative marketing. You do not need to give away part of your profits; the last few cents on every deal is your own "velvet"—and goes into your own bank-account.

We Will Show You The Best Way to Start

YOUR start is important; without experience or guidance, you can badly handicap yourself in the beginning. It may take years to overcome a bad start. The Peerless Way will put your first step on the right road to success, will show you the incubator and brooder that meets the climatic conditions of Canada's cold winters, and will furnish you with plans, blue-prints and complete specifications of poultry houses, etc.; that are actually being successfully used today in Pembroke at the Poultry Yards of Canada, Limited.

You Can Learn At Home Or Come To Pembroke—As You Prefer.

THE Peerless Way, combined with the free, personal advice of our Poultry Advisory Board, will make poultry raising profitable for you. If you will take the Peerless Incubator and Brooder and just follow the plain, explicit directions of The Peerless Way, step by step, you cannot go astray. Or if you prefer it, you can come to Pembroke and, on payment of a small tuition fee, take a course of personal instruction at the Poultry Yards of Canada, Limited. But don't think you have to do that to make a success—for you don't.

Consult Our Poultry Advisory Board.

GET a Peerless Incubator and follow the instructions of our Poultry Advisory Board as outlined in The Peerless Way. Or, in special cases, consult them by mail free. You can't fail to increase your profits. If you are interested in greater profits from poultry, send for our book—NOW.

First in 1880 — **The Keeley Cure** — Foremost Ever Since

DRUNKENNESS

Is a Disease---And We Can Cure It

Most men who drink to excess do so because they cannot help it; they are controlled by a craving which is practically irresistable. This is a diseased condition but can be, and is, promptly relieved.

How? By taking the **Keeley Treatment** at a **Keeley Institute,** the only place to get it and the only treatment which cures alcoholic and drug inebriety.

The **"Keeley Cure"** removes the craving for liquor and drugs and leaves the man master of himself. The system is rational, it embodies no suffering or sickness, no absurd or preposterous claims are made; the hypodermic method of treatment is constantly used, which according to all reputable physicians, is safe, painless, prompt and efficient.

The **"Keeley Cure"** does not nauseate a patient and no attempt is made to cure inebriates by creating a disgust for liquor. A treatment depending on nauseants or emetics for a cure can never be anything but a failure because the patient will soon learn that it is not the liquor which nauseates him but that he has been made the victim of a trick; the diseased condition not being relieved the patient naturally goes back to liquor.

The diseased conditions produced by from five to thirty years constant or periodical use of liquor cannot be cured by a few days of nausea and emesis. Such methods are irrational, brutal, and sometimes permanently injurious.

The **"Keeley Cure"** has restored over 400,000 men and women who were addicted to liquor and drugs; it is the pioneer in this work and has many imitators, but no rival or competitors as far as results are concerned.

If you have need to take treatment for the Liquor or Drug addiction, investigate **The Keeley Cure** a treatment that is known the world around, and which is recognised by the public and the medical profession as the only successful treatment for these addictions. Look up some of our former patients, whom you will find in every community. They are healthy, happy and prosperous; many of them will tell you that they would not be living today if it had not been for the **Keeley Treatment.**

We have special accomodation for ladies, where they can be entirely exclusive, and can be treated as privately as in their homes.

Printed matter and particulars by mail in sealed plain envelope.

All letters promptly answered and treated as strictly confidential.

This Year Own These Haying Helpers

Decide that you'll no longer labor under a handicap at haying time. Secure the services of these **Frost & Wood Haying Helpers—Giant 8 Mower and Tiger Auto Dump Rake.** For twenty years and more these efficient haying implements have saved time, money, labor and horseflesh for thousands of progressive Canadian Farmers. Think of the next score or more haying seasons.

Frost & Wood Giant 8 Mower Tiger Rake

The Frost & Wood Giant 8 Mower is not merely a "fair-weather" machine. It's right there with the power and cutting ability when other mowers are apt to fall down. Put it to work in a heavy or tangled crop and watch how easily it handles the job. You can start it anywhere in the field and the knives will begin cutting the instant the horses move forward. "Flying starts" are not necessary.

The Giant 8 has great driving power because of the simple and compact arrangement of the gears. Smooth-running and light draft are assured by a plentiful supply of large roller bearings. The cutter bar is protected against wear by steel plates. Large bearings—not pins—are used for the connection between cutter bar and main frame.

At every point, in its construction, is put the skill and knowledge gained in over 70 years' experience in building farm machinery to meet Canadian conditions.

The Tiger Automatic Dump Rake is the best sulky rake made. It has given satisfaction for many haying seasons. The teeth are shaped to do the most efficient work. They are made of a special grade of steel, that has proven by test, the best adapted to withstand heavy work and severe usage.

Strongly constructed throughout, is the **Tiger Automatic Dump Rake.** It is a rake that will pay you large dividends of satisfaction at haying time. When you require anything in the way of farm equipment remember our agents can supply your wants. We have catalogs describing and illustrating the different lines; they are cheerfully mailed free for asking. Let us send you one to-day.

DE LAVAL
CREAM SEPARATORS

Their Great Simplicity

DE LAVAL CREAM SEPARATORS EXCEL ALL OTHER separators not only in thoroughness of separation, sanitary cleanliness, ease of running and durability--but as well in their great simplicity.

THERE IS NOTHING ABOUT THE operation, cleaning, adjustment or repair of a modern De Laval Cream Separator which requires expert knowledge or special tools.

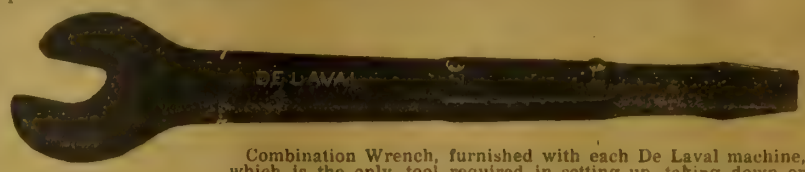
NOR ARE THERE ANY PARTS which require frequent adjustment in order to maintain good running, in order to conform to varying conditions in the every-day use of a cream separator.

THERE IS NO NEED TO FIT and adjust parts to get them together right. They are so carefully and accurately made that they cannot help go together right. All bearings and bushings are easy to replace. There are no complicated springs, keys, ball bearings or other fittings, that only an expert can properly adjust.

IN FACT, SO SIMPLE IS THE CONSTRUCTION OF A DE LAVAL machine that a person who has never touched a separator before can, if need be, take a modern De Laval machine completely apart within a few minutes and then put it together again as quickly. This is something which cannot be done outside a shop with any other separator.

THERE IS NOTHING ABOUT THE MACHINE THAT cannot be taken apart, removed or replaced by any one who can use a wrench or screw driver, In fact, the only tool which isneeded in the use and operation of a De Laval Cream Separator is the combination wrench and screw driver illustrated below.

THE ONLY WAY TO PROPERLY UNDERSTAND and appreciate De Laval superiority to other separators, is to look over, and better still to try, a 1912 De Laval machine. Every De Laval agent is glad to afford prospective buyers the opportunity to see and try a De Laval Separator.



Combination Wrench, furnished with each De Laval machine, which is the only tool required in setting up, taking down or using the De Laval, the most simple cream separator ever built.

Complete gearing of the De Laval Separator as it would appear if removed intact from the frame of the machine. Note the remarkable simplicity of construction.

Makes Pigs "Stay Put"

The hog never grunted that could get the better of a Maritime Wire Fence. For this springy, taut, vastly strong fence, made of extra-quality hard-drawn coil-spring STEEL wire, has its verticals and cross wires locked together with the death-grip lock that CAN'T loosen or slip under any strain whatever. Your cattle and swine will stay where you put them if you fence with this BETTER fence. Once properly erected, Maritime Wire Fence stays taut, straight, sagless and sightly. It is good for twice the fence service ordinary fence can give. Yet it costs no more

MARITIME WIRE FENCE

Save Yourself Worry and Money

Bid fence worries good-bye, and save money, too, by getting the right fence in the first place. You won't have to be patching your fences every spring if you fence with Maritime Wire Fence. It STAYS put too. Made and sold on honor. Send for the Fence Book and Price Lists. Do this now.

It would pay you to be our agent. Send for new 1911 offer. 12

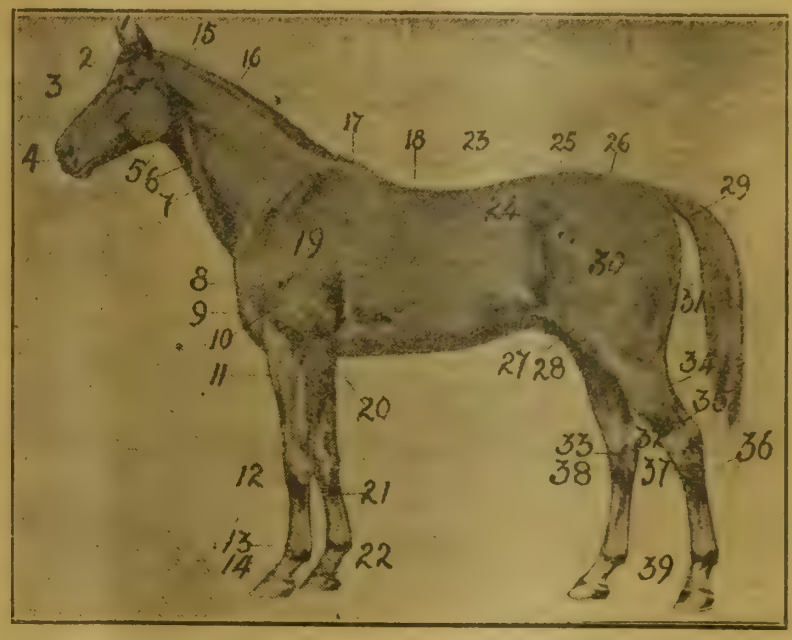
Avoid Objectionable, Detrimental Unsoundnesses.

Hereditary Unsound Mares and Stallions Leave Their Legacy---A Crippled Progeny.

By A. S. Alexander, V. S., Madison, Wisconsin.

THE professional veterinarian when examining a horse for soundness proceeds on the basis of a "negative" test. He looks in turn for one of a number of possible unsoundnesses each at its particular location. Not finding an unsoundness present he accounts the part sound. If all parts are found to be sound, the animal is certified to as "sound." There is no such condition as "serviceably sound." A horse is either "sound," or "unsound." He may be too unsound to work, or able to work despite unsoundness. The seriousness of the particular unsoundness present is to be estimated by the judge and for that intimate knowledge and experience are necessary. ...

For breeding purposes any disease is serious. A disease considered hereditary is most serious. A distortion, deformity or blemish, due to accident, is not serious on the scoré of transmissibility, but depreciates sale value. In work horses the degree to which a disease or unsoundness is temporary or permanent and likely to detract from serviceability for work, must be carefully considered. A horse may be afflicted with strangles ("distemper") and recover perfectly; or the attack may pass off, but leave the animal a "roarer." The attack of strangles would constitute a temporary unsoundness; the 'roaring" a permanent and serious unsoundness in a work animal. In a breeding animal it should constitute an unsoundness unfitting the horse for breeding purposes. A large barb wire cut scar would ordinarily be considered a "blemish" or "eye sore;" but should it have caused permanent lameness it would be a serious unsoundness in a work animal. In a breeding animal, not used for work, the blemish and even the lameness, would be of slight gravity, not being transmissible to progeny.



Key To Chart of Horse.

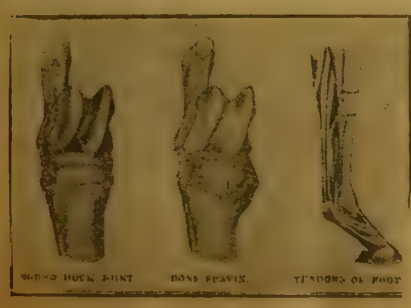
1. Poll. Seat of "poll evil"; 2, Forehead; 3, Face; 4, Muzzle; 5, Throat-latch; 6, Windpipe; 7, Jugular groove; 8, Point of shoulder; 9, Chest; 10, Arm, from shoulder point to elbow; 11, Forearm; 12, Knee; 13, Fetlock; 14, Pastern; 15, Neck; 16, Crest; 17, Withers; 18, Back; 19, Shoulder; 20, Elbow; 21, Seat of splint; 22, Seat of side-bone. Quarter-crack indicated below: 23, Loins; 24, Coupling; 25, Hip; 26, Croup; 27, Flank; 28, Stifle; 29, Hip Joint; 30, Thigh; 31, Quarter; 32, Point of hock; 33, Hock joint; 34, Gaskin or lower thigh; 35, Seat of thoro' pin; 36, Seat of curb; 37, Seat of bog spavin; 38, Bone spavin; 39, Seat of ringbone.

COMMON UNSOUNDNESS TO BE NOTED.

Having learned how to judge the various parts of the horse's exterior, as regards correctness of form, the student should next acquire a fair degree of skill in detecting the more common and serious unsoundnesses. The instructor should describe and show the location of each and, when possible, demonstrate from affected animals. The diseases and unsoundnesses should, as follows, be studied according to each part involved:

HEAD. "Poll evil" is an enlargement of the poll, just back of the ears, containing or discharging pus due to bruise; not hereditary; a serious unsoundness; often difficult to cure; recovered case may leave neck permanently stiff. Look for scars.

EYES. Should be large, bright, mild in appearance, sound, not staring and bulging as in palsy of the sight (amaurosis) each of the same color, lids free from wrinkles, discharge of tears over face is objectionable. Test eyes by gently threatening to strike them with hand. Horse should flinch under this test; pupils of eyes should be eliptical in form, not spherical and should contract when exposed to the light on coming from a dark stable. Cloudiness or opacity denote "moon blindness" (periodic ophthalmia) or cataract. Specks may be due to injuries; unimportant if the sight is not impaired thereby.



EARS. Excessive mobility may indicate impaired vision, viciousness, or nervousness; lack of mobility may indicate deafness, or tetanus (lock jaw). Base of ear sometimes seat of troublesome discharging fistula.

MUZZLE. Nostrils should be free from discharge of chronic catarrh or glanders. Sometimes plugged with sponge to hide "roaring." Lining membrane should be healthy pink in color; free from ulcers, or purple spots or bad smelling discharge. Lips not torn; free from chronic sores from bit at angle of mouth.

TEETH. Examine for diseased, missing or projecting molars; overlapping incisors ("parrot mouth"); "bishopping" (artificial marking of the incisor to alter indications of age) and under-shot jaw.

TONGUE. See that the tongue is intact and healthy. Part of it may be missing, or mutilations present. See that floor of mouth is sound where bit rests.

UNDER JAW. Look for discharging, or plugged fistula of salivary duct or one connecting with a molar tooth root; abscesses and tumors.

NECK. Broken crest in stallions; sores; skin disease; watch for artificially "braided in" mane.

WITHERS. Fistula of the withers, acute, chronic or healed; collar sores.

SHOULDER. Collar boils; fibroid tumors from bruising; "sweeney;" fistula or abscess.

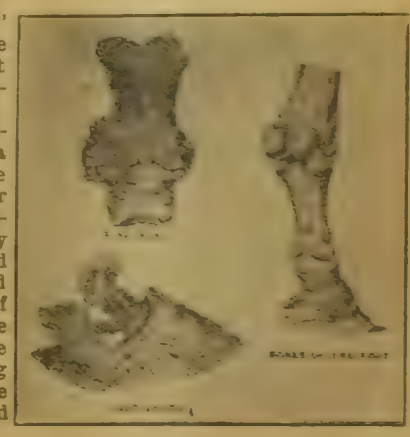
ELBOW "Shoe boil," from bruising of point of elbow.

KNEE. scars from "broken knee," due to falling; puffs; "buck knee" (bent forward); "calf knee" (bent backward); capped knee. When splints are close up to the knee, they are liable to cause lameness and are to be considered dangerous and objectionable.

CANNONS. Splints are abnormal bony growths formed at the sides of the cannon bones where the small splint bones (metacarpals in front, metatarsals in hind leg) overlie the large cannon bones. They are objectionable, may cause lameness when forming, are often an indication of light bone, but ordinarily should not be deemed to constitute hereditary unsoundness. If found on all legs, of large size and associated with other bony growths (exostoses) they may indicate a hereditary tendency to such bony growths (bony diathesis) and the animal should be rejected for breeding purposes. Examine back tendons for thickening or "bowed" condition. In examining horses having hairy legs search for evidences of grease and grease heel, such as old scars, fissures, grape-like growths or discharge having bad odor; also for "scratches."

FETLOCKS. Seat of puffs (wind galls), interfering sores; "knuckling" or "cocked" ankles; grease, grease heel and scratches. Examine on, just above or below for scars of "unnerving" (neurotomy).

PASTERNS. Seat of ringbones, deposits of superflous, granular bone, a serious hereditary unsoundness. These bony growths are found on the upper middle or lower portions of the pastern bones, may partially or wholly encircle the bone, and in aggravated cases, cause lameness and involve and interfere with the proper action of the fetlock joint above, or with the coffin joint at the lower end of the pastern bone. They give a bulging appearance to the part of the bone affected, have the feel of bone and



Good Type of Draft Horse Pasterns.
"Moderately Sloping."

constitute unsoundness. In work horses ringbone involving a fore pastern is much more serious than ringbone on the hind pastern.

CORONETS. (hoof heads). Sidebones are located under the skin of are due to the lateral cartilages at these parts changing to bone. When present they may be detected as prominent, hard, bony masses protruding above the hoof at the sides of the feet towards the heels and bulging the hoof under the part involved. When sidebones are absent the cartilages can be grasped between the fingers and thumb and moved or bent from side to side as if they were formed of stout rubber. Sidebones are common in draft horses and constitute unsoundness. Horses having wide, flat low heeled hoofs are most subject to this unsoundness. Horses affected with sidebones and ringbones should not be used for breeding purposes. "Quittor," a fistulous abscess, is also a common unsoundness of the coronet.

FEET. "Navicular disease" causes hardening and contraction of the hoof and chronic lameness. The affected horse "points" his lame foot forward when standing at rest, starts off lame and "warms out of" the lameness. The tendency to the disease is deemed hereditary. It constitutes a grave unsoundness for all purposes. Other common unsoundnesses to be looked for are "founder," indicated by rings and ridges on the hoof wall, abnormal projection at the toe, convexity at the sole ("dropped sole") and lameness; sand crack (in wall at front of toe); quarter crack (in wall at quarter); corns, in the sole at the angle of bar and heel; and "thrush,"

Sound, "Open" Hoof, Showing Wide Heels, Prominent Frog and Strong "Bars."

a diseased condition of the frog characterized by a bad smelling discharge from its cleft.

HIPS. Examine for fractures of the point or shaft of the hip (ilium) indicated by distortion, on comparing one hip with the other from the rear also examine for similar distortion on haunch at side of tail (from fracture of the tuberosity of the ischium).

TAIL. The black skin of the under side of the tail and nearby parts often is the seat of cancerous, malanotic or "pigment" tumors in aging white or grey horses. The disease is incurable and constitutes unsoundness in both work and breeding horses. Examine end of tail for diseased or unhealed conditions due to docking and see that the tail is not artificial and "joined on."

STIFLE. Should be free from dropsical swellings and the knee cap (patella) should remain firmly in place during motion.

HOCKS. These important joints should be free from "bone spavin," "bog spavin," "thoroughpin" and curb." Each constitutes an unsoundness in both work and breeding animals; tendency to them is considered hereditary. Bone spavin is a bony growth upon the surface or among the small bones, on the inner, lower part of the hock joint, or may involve the true joint higher up. A bony growth appearing upon the outer part of the joint is called a "jarde." In spavin lameness the horse starts out lame and improves or recovers with exercise. Bog, or so-

xA Prominent Sidebone.

called "blood" spavins, are soft, fluctuating distensions of the capsular ligaments (synovial or joint oil sacs) of the hock joints, and give a bulging appearance to the front of the part involved. Curb appears as a bulging, calloused enlargement upon the rear portion of the hind leg, just under the hock joint, involving the tendons and ligaments and sometimes the bone of the part. Crooked or sickle hocks are most prone to curb which follows undue strain when at play or work. Actual unsoundness, implicating the hock joint and objectionable conformation, rendering the joint liable to contract disease or become unsound, should be carefully avoided in the selection of breeding stock and work animals.

OTHER UNSOUNDNESSES.

CHOREA, SHIVERING, OR ST. VITUS' CANCE is considered a hereditary disease and also constitutes unsoundness in work horses. It is commonest in nervous, tall, narrow animals. The disease is most readily detected when moving the horse from one side to the other, or in backing out of the stall. The leg is jerked up once or twice at these times and the tail and muscles quiver momentarily. The symptoms disappear when the horse is exercised. "Stringhalt (akin to chorea) is the term applied to the exaggerated jerking up action of the hind leg seen in some horses. The trouble in some instances is remediable by operation (peroneal tenotomy).

ROARING. (laryngeal hemiplegia) is characteriled by noisy breathing when the horse is exercised. It constitutes unsoundness in both work

xxSplints.
Bad "quarter crack" on right foot.

and breeding horses.

HEAVES. (emphysema of the lungs), is indicated by double bellows like action of the abdominal muscles as the horse breaths; cough also is present. Like roaring it is an unsoundness of the breeding animal and work horse.

VICES. such as cribbing, windsucking and weaving are best discovered when the horse is in the stall although not certainly hereditary are highly objectionable and detrimental unsoundnesses.

The Use of Cement and Steel in Modern Farm Building Construction.

Editor Maritime Farmer.

The farmer, like his city brother, is, at the present time, taking advantage of every modern method, or material to construct his buildings along the latest lines and I feel it is a duty for some one who understands the use of these methods and materials to explain this through the agricultural papers. I know there are many who are more competent than I, to do this, but none seem anxious for the work, so I will do the best I can and ask the readers to overlook the many literary mistakes which will occur.

The most important of all the many materials are concrete and steel and of those two I wish to write at present, taking up the use of concrete first as it forms the foundations and floors, and steel later is a covering for walls and roofs.

Prominent Ringbone on Pastern.

Unsound "Cocked Ankles" Causing "Knuckling."

MATERIALS FOR CONCRETE.

Before commencing the actual mixing of the concrete it is necessary to give a short discussion on what concrete is and so impress some important facts on those about to engage in this work.

Cement is a product having a value from its ability to adhere to the various materials used in masonry construction.

If water is added to this powder like substance it takes a plastic form and will remain so for about half-an-hour, when it begins to set or harden.

Now, the cement or concrete loses much of its strength if it is disturbed after this setting process has commenced, and if this has far advanced it will totally destroy the concrete to disturb it.

This brings to mind the important facts that cement concrete must be placed in position within twenty or thirty minutes from the time it is first wet.

Another very important point is the protection of the work from the hot sun for five or six days after it has been placed.

Frost will also prevent green concrete from setting, but if no weight is placed upon the work and the mixture is not allowed to freeze until dumped into the forms, no bad effects will follow as the complete setting will take place as soon as the frost is thawed out.

Cement can be bought in wooden barrels, cloth sacks, and paper sacks.

The first named form of selling it is too bulky for the farmer's use and is difficult to measure for batches.

The cloth sack is about the best way for the farmer to buy cement as he can open the bags carefully and pack them up nicely and return the empty sacks to his dealer when he gets a rebate of 10 cents each for the sacks thus lowering the price to the same as that charged for the wooden barrel, while the advantage of having it in small, and easily handled sacks is quite an item.

The paper sack is also a good way to buy cement if it will not require much handling. Loading and unloading many times is sure to tear a considerable number of the sacks with a consequent loss to the consumer.

The best place for the farmer to buy cement is from his nearest local dealer as the amount he is usually buying is small and could not be shipped by the manufacturer.

When the cement is brought home to the farm it must be stored in a dry building where no moisture can get at it, as even moisture from the air is quickly absorbed by it.

This causes it to become lumpy, and in some cases a solid mass. When in this condition it has lost much of its strength and should not be used even if it can be easily broken up. It is always best to lay the bags of cement on a plank or board floor raised by means of sleepers or blocks, a few inches above the ground to avoid dampness being drawn by the lower row of bags.

The materials to be used in the mixture should be selected with considerable care, particularly the sand which should be coarse, clean and free from loam or clay and weeds.

Stone or gravel which forms the largest part of the aggregation must be clean and free from weeds or grass. Other materials such as cinders, coke and broken bricks are used to replace the gravel or stone but for an ideal mixture nothing equals sand and crushed rock.

The size of the rock or pebbles in large foundations may be as much as 2½ in diameter.

Thin walls and reinforced concrete work will require rock or pebbles 1,¼" in diameter, and finishing coats of very hard concrete takes ¼" of stuff.

The water used in mixing should be clean and free from all acids.

Sometimes the farmer may have a gravel pit containing sand and gravel of about the right proportions for good concrete work. In order to make certain of the proportions being correct, it is best to screen some of the natural mixture and find just what proportion of sand there is to gravel as generally the former is in too great proportions and care should be exercised in the selection of this material. A nother thing to guard against is the uneven running of the mixture throughout the bank.—A.A.G.

Spotswood Daisy Pearl 17696 ADV. R. 790.

The Premier Cow of the Guernsey Breed.

Year's record as a four-year-old 11570.71 lbs. milk; 572.67 lbs. butter fat; made while owned by J. A. Beidler, Willoughby, O. Year's record as a seven-year-old, 18602.80 lbs. milk; 967.38 lbs. butter fat, made at Anna Dean Farm. Barberton, Ohio. Bred by Edward F. Price, Broad Axe, Pa. Owned by O. C. Barber. Cut by Courtesy Guernsey Breeders' Journal.

Who Can Beat This Record ?

Editor Maritime Farmer:—

An Ayrshire heifer by the celebrated bdll 'Peter Pan" had her first calf as a two year old, on the 5th. of Sept. last. She is now three years past, is due to freshen again on the 20th. of August, and is today giving just 25½ lbs. milk in the 24 hours. If any of your readers has an Ayrshire or Holstein that is doing as well under similar conditions I would wish to hear from them.—Prescott Blanchard, Truro, N. S.

Varieties of Farm Crops Compared.

According to tests of the best varieties of farm crops, carried on at the Central and Branch Farms of the Dominion Experimental Farms system, some sorts of each class are much suuerior to others that by some are considered good. As a guide to the crop growers of Canada as to which varieties are most valuable, Bulletin No. 71 of the Central Experimental Farm has been prepared for distribution. This Bulletin gives selected lists of the best varieties for each province or district, the lists being based on the accumulated experience of past years. Among the newer varieties of merit, Marquis wheat, Manchurian barley and Arthur pea are especially mentioned. This bulletin of 74 pages deals not only with varieties of grain crops, but with those of fodder crops and potatoes as well. Copies may be produced by applying to the Publications Branch, Department of Agriculture, Ottawa, Ont.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

WHY CROP ROTATION IS NECESSARY.

Every well outlined system of farming consists not in growing one particular crop year after year, but in following certain crop rotations that will not allow the same plant to grow on the same soil many years in succession.

The reason for this becomes very apparent when we fully understand the plant food needs of the various crops. From work that has been carried on for a great many years, we know quite fully what most plants need in the way of nutriment, but although much has been written regarding the functions of the nutriment materials within the plant itself, very little is certainly known.

We know without a doubt, that some soils may become depleted of some of their constituents sooner than others. When wheat cropping is followed nitrogen is the first of the really essential elements to disappear; but, on the other hand, their are crops that use less nitrogen and draw more heavily on some mineral ingredients, such as potassium and sulphur. When leguminous crops are grown nitrogen tends to accumulate in the surface soil.

Each crop requires special substances in quantities in a certain state of combination. This being true it necessarily follows that the soil will be more able to meet the demands of any particular crop whenever the intervals at which that crop is grown are longest.

Suppose a soil, that contains abundant mineral matter is sown to wheat several years in succession; this crop will use practically all the available nitrogen of the soil without materially depleting its mineral supply. Wheat growing would not then be profitable. Suppose a bean or some root crop is grown likewise for a number of years; these crops would draw heavier upon a different set of substances that would finally be so much diminished that to grow them profitably would be out of the question. The soil, however, would be in prime condition for growing wheat.

If, on the other hand, these crops are grown alternately, each would draw especially upon its particular set of plant foods, and the result would be increasing crops for a greater length of time.

Two other important considerations should be given to any system of rotation. Crops differ very markedly, not only in the amount of food materialls that are taken from the soil, but also in the capacity which they possess for absorbing their food from different classes of soils. They also differ in the amount of crop residue that is left on the field. Root crops leave the least amount and clover and grasses most. This latter point is important because the crop residue is one source of soil humus.

Consequently, for maintaining the proper physical condition of a soil and to keep all its sets of mineral plant good elements well balanced so as to obtain the largest crops for the greatest length of time, crop rotation is quite necessary.

THE SAN JOSE SCALE.

Only a few short years ago the orchards of the Maritime Provinces were thought to be immune from the invasion of the Brown Tail Moth while orchard and forest trees in the neighboring United States were being devastated. But there came a day when the fruit growers of Nova Scotia were shocked to hear that the dreaded pest had been discovered in the very midst of the best fruit growing district of the province. A hue and cry was raised and, thanks to the timely efforts of Professor Cumming and his efficient staff and the co-operation of the fruit growers, a continuous war has been waged against the Brown Tail so that it has been kept pretty well under control.

The moth has also been discovered in New Brunswick and there too a campaign of warfare against the invading moths has been successfully carried on by the Department for Agriculture.

The keeping of orchards immune from the invasion of the San Jose Scale, the worst foe of the fruit growers is probably one of the greatest problems that confront our fruit growers today. Thorough measures are absolutely necessary, in every section, for if the scale once becomes established neglect means loss of fruit within a season or two and death of trees in a few years. Only vigilance and prompt action will keep any threatened orchard from severe loss. This danger has become so well understood that in many sections of the United States annual spraying for San Jose Scale is as much a feature of orchard work as spraying for Scale or Codling moth. Where this work is done annually and done well, the scale, while not eradicated, is so completely controlled that the trees retain their full vigor and little or no spotted fruit is ever found.

On another page of this issue will be found the startling statement that the scale has been discovered in the Annapolis Valley. There is a ray of hope that the insects may all be dead, but never-the-less every precaution is necessary to carefully guard and watch the infested trees to promptly stamp out the pest, should it be alive, before it gets a foot hold.

THE BETTER FARMING SPECIAL TRAIN.

Under the auspices of the Canadian Pacific Railway, the Intercolonial Railway, the New Brunswick Department of Agriculture and the Dominion Department of Agriculture a better farming train is now touring the Province of New Brunswick on a schedule of dates as was announced in the last and present issues of the Maritime Farmer.

Better farming trains have been a successful method in many of the States of the American Union in bringing modern methods of farm practise to the attention of the masses. The Maritime Farmer sincerely hopes that the present educational campaign in New Brunswick will be as fruitful.

Those who came through and will be with the train in New Brunswick, are professors from Macdonald College, including Professor Barton, who has charge of the live stock exhibits and speaks on animal husbandry; Professrr Blair, horticulture, fruit growing, potato growing and fertilizers; Professor Lochead, injurious insects, drainage, fungous diseases and weeds; Professor Lynde, soil cultivation, drainage, etc.; Professor Jull, poultry raising; and G. C. Cutler, seed selection, crop-growing, rotation, etc.

The Dominion Department of Agriculture is furnishing for this province the services of H. N. Flewelling for the dairy branch of the work, and of S. L. Peters for the fruit branch, with particclar reference to the carrying out of the Fruit Marks Act, regarding packages, packing, branding, etc.

The Provincial Department of Agricnlture is contributing the services of Dairy. Supt. McDougall, Poultry Supt. Jones, and R. P. Gorham of the horticulture branch; and Wm. McIntosh to deal especially with the brown-tail and gypsy moths.

The C. P. R. and I. C. R. provide the cars, motive power and train crews as well as the services of a special official of each road as their contribution to the work.

The schedule as advertised will be carried out, and as all the branch railways and river steamers are giving special excursion rates, and where necessary speeial trains to meetings at junction points the train will be brought within easy reach of the farmers.

Look up the dates on which the farming train is at your station and plan to be present with the rest of your neighbors. Lest your friends should forget the dates refer to them frequently when conversing with your neighbours.

ONE ADDED KERNEL MEANS 20,000,000 BUSHELS.

If one extra potato were added to each plant grown in the United States the actual increase in the annual yield of the crop would amount to 21,000,000 bushels. The figure is given in a report on "Dry-Farm Crops and Their Improvoment," by Prof. F. B. Linfield, of the Montana Agricultural College, and published by the Internarional Congress in its annual handbook.

"If one extra kernel were added to each head of oats, barley wheat or ear of corn," says Prof. Linfield, "we would have of oats, 20,000,000 bushels extra; of barley, 15,000,000 bushels extra; of wheat, 15,000,000 bushels extra, and of corn, 5,200,000 bushels extra. And not for one year alone, but for all time, this slight increase in the yield of the plant would add many millions of bushels to our crops.

"Clean, plump, selected seed, true variety, not mixed, free from weed seed and from disease and with strong germinating power should always be planted by the farmer as a means of increasing his own yield."

NOTES.

Too many farmers forget the third dimensions of their farms. There is a thickness to their farm as well as length and breadth, and the thicker the farmer makes his farm the better the farm, other things being epual. There is another farm underneath the one you are farming and if you use the forth dimension in farming—brains -- you will use this farm, too. It belongs to you and no one else can use it. Get down to it and make it produce. The big crops are grown by using the "farm in the cellar."

Cheaper Money For Farmers.

Editor Maritime farmer:—

Some time ago I noticed an article in the Maritime Farmer on "cheaper money for farmers.' This is a most important question and, while you don't state just what is about to be done in this respect it is pleasing to know that a movement of the sort is on foot.

The want of "capital," of a little needy money, is often a serious matter with many farmers. Having to buy everything on time and pay exhorbitant rates of interest is what keeps so many good men down. It seems a shame that a farmer who is a real earner of wealth should have to pay the banks eight per cent. on short loans while traders of all sorts get all they require for 6 per cent. This is not justified on the ground of greater risks for the banks will not take any risk and always have good security before any money is advanced.

Yet even at the high rate demanded of them, it would be good business for most farmers to borrow money and buy for cash rather than settle for their supplies on long time payments. It is strange but true that most men would rather pay 20 to 30 per cent. to a dealer and buy mill feed by the bag, than, enter into the awe inspiring presence of a bank manager and borrow money to buy for cash in larger quantities.

This want of a little working capital is, often considered the greatest drawback with which the farming community has to contend. In bad seasons, such as the eastern end of this province experienced last summer, a great many farmers are simply driven to do things, that they know are an injury; wrong methods are just as often the result of hard necessity as lack of knowledge.

This is a fact that few pedagogues seem to realize when they offer such advice as we continually see in farm journals,—to do everything with a lavish hand, with many reasons why it will pay in the end. It sounds all right to advise keeping the cows off the grass until it has a good start in the spring as I noticed lately when a prominent dairy authority advised not to be tempted to turn the cows out as soon as the fields looked green and the hills were covered. "If you feel tempted to turn the cows out just don't do it that's all it will not pay and it cannot pay in the end," regardless of the fact that many readers have been buying hay at war prices during half the winter, where then out of money and hay too and often could not get it at any price.

It is all right to advise sowing plenty of clover seed at 30 cents per pound, of buying only the highest and costliest seeds, of breeding to the high-class sire, even if his fee is high, buying only the best bull, cutting out the poor stock of all kinds and substituting something good. It will pay in the end. Yes, we all argue good goods are cheapest in the end; all this will pay in the end, if the over-burdened farmer can hold on until this end shows up.

The above is good advice for the men who can adopt it, they dont need it most; but what of the poor struggler, who finds himself behind, who is forced to buy the necessaries of life on credit and all machinery and other articles on long time payments, who is simply forced to spend his money before he makes it. This is the man who needs some real assistance. If there was a system or arrangement whereby the Department of Agriculture could secure for him some money at 4 or 5 per cent., it would give him a measure of relief and many men would be, as we say, on their feet and become independent.

Buying everything on time is paying a killing rate of interest.

Now, many wonder why it is necessary to have to give so much assistance to the farming industry, as the Government of the different Countries are continually called upon to do, when other industries independently flourish in cities and towns. The reason is this: in the towns,competition and the high rate of taxation and expenditure keep the owners of every business keyed right up to a high pitch, but in the country, especially where land is cheap and taxation light, a farmer can scrape along on very little, as he is not forced to raise any large sums of money,and we always find the most careless farmers on the cheapest land.

There are two ways only whereby farmers can be induced to take up better methods:—Education and Coercion. If by the latter method, he must often have some financial assistance or go out of business. It is said that the McKinley tarriff on barley forced the Quebec farmers to take up dairying and other better methods of farming greatly to their advantage; but often an experience of this kind is the means of putting a man out of business and driving him to the towns.

We hear a continual wail, from the consumer, of the high cost of living, of too many in the town, and too few in the country, and it looks as if somebody has to go back, or those now on the land will need to increase production. The trouble is that there is not nearly enough food stuffs being produced the world over, on the land now being cropped. It costs no more to seed, work or fence the land for a fifty bushel grain crop than it does for a twenty-five bushel crop, or for a 400 bushel turnip crop than it does for a 1000 bushel crop and not very much more to harvest in either case. The land is not fertile enough, and not properly cultivated in most cases, but particularly not fertile enough. Now what can be done about it? Our agricultural teachers have always recommended the keeping of live stock, and buying manure if needed in the form of concentrated feeds. Seldom do we hear the use of commercial fertilizers commended. Just why this is so I never could understand, as it certainly pays to use fertilizer on poor soil rather than plant without manure. Take the case of a farmer this present spring who wants to grow more feed for his stock to feed on the land, and who cannot afford to wait until another year, why not advise him to spread his manure over double whatever land he had intended to dress for roots and add sufficient fertilizer to make up the deficiency?

I saw an account of an experiment that Mr. Fuller of the Truro College farm, conducted in growing turnips with superphosphate, in which he demonstrated that every extra bushel he got by its use cost 2.9 cents. This is surely cheap feed and must have paid handsomely as the superphosphate was fixed in the soil and would benefit the following crops. Keeping a large dairy herd, as we do, and having perhaps more manure than most farmers we always use some commercial fertilizer on any land that we think can profitably use it. We would not think of sowing turnips without it. I believe the Governments of the different Maritime Provinces could do more to increase the production of the farms and the revenues of the country by assisting farmers to secure fertilizers and concentrated feeds at the lowest cost than by any other system.

Prices were never so high, and it is a shame to have the crop averages so low. A great effort should be made to increse the fertility of the land. When a farmer is rightly started in keeping good stock and has plenty of feed he can grow all his manure if he wishes, but to get properly started there is no way in my opinion that gives results so quickly as by the judicious use of fertilizers, and to buy these the majority of farmers require money at a lower rate of interest.—Walter M. Lea.

The Housefly on the Farm.

Editor Maritime Farmer:—

Scouts and fore runners are already on the premises, apparently selecting comfortable quarters for hosts that are to follow.

Innocent fly! What a resentful feeling there has arisen against him!

Late sanitation laws and rules have condemmed him utterly.

Not knowing the ban upon him, the intrusive insect will sail into tbe room with the utmost sang-froid; select the same old spot on your exposed cranium, for exploration, that he performed on last year; crawl around on your hands, inserting his tiny claws in every pore; play bo-peep with you at your mid-day nap, seemingly enjoying your ill temper as you viciously endeavor to swat him.

Notwithstanding his teasing pro clivities you possibly might welcome him, in a measure, as we do the birds, after a long lone winter,but for some bad failing.

The housefly is too imprudent, thoughtless, reckless; has too much "don't care" in his make-up, to be entitled to any respect.

Without considering what vile cesspool he may have just issued from, he will dive into the house, if possible, and land his precious carcass on any delicacy that may be set out on the table.

In the pantry he loves to forage. If he finds anything sticky, you will find him there ,patiently awaiting to be helped out.

"Put on your screens," says Carefulness, "and keep the pests out of the house."

All right my friend, granted they are on, a farmer's business requires going out and in the house frequently, often cumbered with pails, milk tins etc.

Again, children, an aset of the exemplary farm-house, have to be reckoned with. The little tots go slowly out and in, struggling with infantile strength against the tedious, persistent spring door. While the child is struggling with the obstinate door the watchful fly slips through.

Votaries of the sterile life, may have their immaculate flyless rooms: maybe leaders in fashionable society and social life; maybe brilliant lecturers and public favorites, but their questionable doctrine and example are not conducive to ideal farm home-life.

By all means let the farm be brightened by young fresh lives even if they bring occasional cares, inconveniences or troubles.

Another way may be found to lessen the fly nuisance about the farm buildings, at the same time improve sanitary conditions generally. If the flies can be made scarce out of doors, there will be less trying to get in the house.

In the late spring or early summer, when the rush of the planting is over, before hot weather, purify the premises. Clean out thoroughly henhouse, pig pen, cellar, kitchen slop deposits, vault, barn accumulations, anything, everything that the insects breed into.

Haul the refuse to some distance from the house, and make a compact heap of it, near some field where it can be spread later. Manage to mix the refuse as it is hauled somewhat; the result will be, a valuable compound of fertilizer accumulated for future use, from refuse that is usually largely wasted.

Keep a watchful eye around the premises, all through the season until cold weather, clearing out and hauling to the compost pile any filth that is breeding worms. The consequence will be, purer air—healthier surroundings—far less flies.

The insects, not having breeding ground, cannot start up their usual factories. For every mass of filth, writhing with nauseating life, is nothing less than a "factory," turning out a finished product of healthy, active, obnoxious flies, scores of hundreds daily, according to the size or capacity of the cess-pool.

Vaults should be kept continually and utterly dark. With the least light admitted, they become "factories" of the worst kind, furnishing flies for the house at a rapid rate.—R. W. Wetmore, Clifton N. B.

War on the San Jose Scale.

At last the expected has happened, and the long dreaded San Jose scale has made its debut in Nova Scotia. The great demand for young trees has almost swamped the nursery-men with orders, and to take advantage of the moment as it flies, stock is being sent out that a few years ago would have been put on the brush heap. Young trees that are badly infested with scale should never leave the nursery, no matter how much fumigating is given. If two branches came together in the fumigating box directly over a live scale holding it between them, that scale is protected from the gas and is sent out as full of danger as ever. The little insect reproduces itself so fast that it becomes a great grandfather in the course of twenty-four hours.

Much of the stock coming into the Annapolis Valley, this spring from some of the larbest nurseries in Ontario, is peppered all over with scale, most of them are dead as the stock is all fumigated, but when there are so many, the chances are great of some getting through alive.

The inspectors are now at work and every one receiving trees from outside of Nova Scotia should immediately notify Prof. Cumming, at Truro, that an inspector may look over them. It cannot be told if any scale is alive until the growing season commences, and if the infected lots are all located inspection will be much easier later. This pest is probably the greatest that troubles the fruit growing industry, and its establishment in Nova Scotia would be more than a local calamity. It is said to double the cost of apples and would certainly place a check on the rapidly growing value of orchard lands in the Valley. Fifteen years ago the United States produced from sixty to seventy million barrels apples. For the last five years her production has been from twenty to thirty millions. One of the reasons for this decline and pernaps the greatest of them is the ravages of the San Jose Scale.—Manning W. Ells, Secretary N. S. F. G. Assoc

HORTICULTURE.

San Jose Scale.

With the rapid growth of the fruit industry and the occurrence of the San Jose Scale in countries from which we import nursery stock, we are confronted with one of the gravest entomological problems. The Scale is spreading where its presence often is not recognized until it has become serious.

Let us briefly consider what the insect is, its habits and life history;

Historical.

According to the investigations of C. L. Marlatt, Bureau of Entomology, U. S Department of Agriculture, the native home of the insect is China. It was discovered in this country in 1873, when it had become a serious pest in the Santa Clara valley in California. In 1880 Prof. J. H. Comstock, then entomologist of the U. S. Department of Agriculture, described it and gave it the appropriate name of "Pernicious Scale." Its introduction into California was for some years a mystery until it was found that trees imported from China were infested with the pest. In 1901-'02 Prof. C. L. Marlatt made a trip to Japan and China for the purpose of locating its native home. He found it in the country north and west of Pekin.

San José Scale.

San Jose Scale. a, infested twig; b, view of infested bark magnified. (From Howard and Marlatt, Bureau of Entomology, U. S. Dep't. of Agr.)

While it spread over new territory in California it was not until 1893 that it was discovered in the East. It was at Charlottsville, Va., where it had been introduced from nurseries in New Jersey. Subsequent investigations showed that it had been shipped to New Jersey as early as 1886 or 1887 a coosignment of Kelsey plums from the San Jose region of California. All these years from 1886 or 1887 to 1893 these New Jersey nurseries had been selling and shipping to other parts of the counry. Wherever infested plants were received new centers of infestations broke out, and thus the insect spread over the fruit sections of America.

DESCRIPTION OF THE SCALE.

The full grown scale is circular in shape, of an ashy gray color, with a small protuberance, called nipple, at the center. Around the nipple are two or more concentric rings, the general shape being conical except when crowded, when all kinds of shapes may be found.

The male scale is more elongated, smaller, and frequently darker. The nipple is not at the center but near the anterior end of the scale. When young the scale of both sexes is nearly jet black and often very difficult to see with the nacked eye.

LIFE HISTORY

The females never leave their scales; under them they live and die. The male, however, molts in early spring, and leaves the scale as a minute active insect with two wings. It dies after mating. The female gives birth to living young. The newly born scales are very minute, oval in shape, but their bright orange-yellow color makes them conspicuous on the bark. After wandering about for twelve hours to a day they settle down to feed. The insect then inserts its beak into the tissues and sucks the sap. Here it remains during the feeding period. The male becomes full grown in about 25 days, but the females require a little longer time. In from 10 to 18 days the young of the next generation appear. During the season of activity each female may give birth to from 300 to 400 young. The over-wintering females produce about 100 young which become full grown in about 30 days. As from 5 to 6 broods occur in a single season calculation will show that one pair of insects can theoretically give rise to over 3,000,000,000 offspring in a single season.

HOW TO DETECT SCALE.

When a shipment of nursery stock has been received even fumigation should not be depended upon. The orchardist should keep close watch over such shipments when they arrive.

The plants should be carefully gone over with a reading glass, paying special attention to the crotches, and anything on the bark that may suggest an appearance like the description given above should be removed without touching it directly, packed securely in a regulation mailing case and sent to the office of Dominion Entomologist, Ottawa, for identification.

In light infestations the leaves and fruit are but sparsely attacked, but on badly infested trees the insects settle anywhere on the plants where tissues are exposed to them to feed on. They become so crowded as to overlap, creating an ashy gray scurvy incrustation on the bark.

They may occur on both sides of the leaf causing purplish, grayish or reddish discolotations on the young wood of peach. The bark turns red and when cut the coloration may be seen to extend to the wood. Indivi-ual scales cause reddish spots with a diameter several times that of the scale. The winter is passed in all stages of growth from half grown to mature insects. Many of the adult females die and these dead and dried up scales are always in evidence. When a knife handle or some other hard object, or the thumb nail, is rubbed over the surface of a badly infested twig the insects are crushed under the scales and a yellowish fluid appears.

The New Perfection Oil Cook-stove
Suits Everybody

It suits the most exacting French chef. It suits the housewife. It is found in luxurious villas—in camps—in farms—in humble city homes. Everybody uses it; everybody likes it. It is the all-round stove for all the year round. It bakes, broils, roasts and toasts as well as a coal range. It is equipped with a special heating plate, and we sell the New Perfection oven, broiler, toaster, and pancake griddle—each specially designed for use with the

New Perfection
WICK BLUE FLAME
Oil Cook-stove

All dealers sell the stove. It is handsomely finished in nickel, with cabinet top, drop shelves, towel racks, etc. Long chimneys, enameled turquoise-blue. Made with 1, 2 or 3 burners.

Free Cook-Book with every stove. Cook-Book also given to anyone sending 5 cents to cover mailing cost.

THE IMPERIAL OIL COMPANY, Limited

HOW THE SCALE SPREADS.

In the first part of this paper we noticed how the scale was introduced into the United States and how it came to the East and from a few nurseries spread over the country. The fact that it has thus spread should urge upon every ane the extreme importance of using the most scrupulous precautions in handling trees to keep it from being disseminated. We have explained that the young are motile the first day after birth. As the broods are not defined these crawling specimens are in evidence on every infested tree during the entire growing season. They may then be carried by birds, bees and other insects. They may be blown by the wind, and frequently, while spraying an infested orchard, careless operators carry them on their hands and clothing. After they have become stationary they may be carried by the plowman when cultivating the orchard. Correspondents often wrap infested twigs carelessly when transmitting them through the mails for identification.

FOOD PLANTS.

The following is a list of food plants upon which the scale has been found and recorded by Dr. L. O. Howard:

ORCHARD FRUITS.—Pear, Peach, Apple, Plum, Cherry, Rocky Mountain Dwarf Cherry, Persimmon, Quince Flowering Quince.

SMALL FRUITS.—Strawberry.

BRUSH FRUITS.— Raspberry, Gooseberry, Grape, Currant, Flowering Currant, Black Currant.

NUT PLANTS.— Almond, Chestnut, Pecan, Black Walnut, English Walnut, Japan Walnut.

MISCELLANEOUS ORNAMENTAL PLANTS.—FOREST AND SHADE TREES.—Rose, Hawthorn, Spirea, Cotoneaster, Euonymus, English Huckleberry, Linden, Acacia, Elm, Osage Orange, Alder, Sumac, Weeping Willow, Red Dogwood, Juneberry, Laurel, English Willow, Golden Willow, Laurel-Leaved Willow, Milkweed, Catalpa Speciosa, Lombardy Poplar, Carolina Poplar, Golden-leaved Poplar, Silver Maple, Cut Leaved Birch, Mountain Ash, Japanese Quince, Actinidia, Citrus Trifoliata, Snowball, Loquat, Akebia.

REMEDIES.

During the last ten years almost every ingredient that appeared to have any insecticidal value has been experimented with in the hope of finding an effective method for controlling the scale. The most important spray mixtures are lime-sulphur salt, lime-sulphur, whale oil soap, kerosene, crude petroleum, and kerosene or crude oil emulsions. All these preparations are mainly winter sprays, being applied when the tree is dormant and leafless. They vary in price and other points of merit, and each grower must be guided by his own judgment in every case.

A full list of remedies used in Ontario for the San Jose Scale will be published in our next issue.

Notes From The Valley.

The following letter has been received by the Secretary of the Fruit Growers' Association, from the Department of Agriculture, in response to the resolution on the "Barrel Question" as reported in a recent issue of the Maritime Farmer:

Dear Sir:—

In reply to your letter of the 13th inst. I would say that I note your Resolution respecting apple barrels. Of course you understand that no change can be made in the Act until next session of Parliament. As for the marking of the words "Standard apple barrel" on each package I would point out that this is not exactly a standard barrel. The law does not provide for that at present

"BETTER FARMING SPECIAL TRAIN"

Dates and Hours Along the I. C. R. System.

The Farming Demonstration Special Train will start its tour of the Intercolonial Railway in New Brunswick under the auspices of the provincial government on Friday, June 21st, from Fredericton.

The "Better Farming Special" will be composed of seven cars; three baggage cars being fitted with exhibits and specimens of farming products chiefly from the McDonald College Farm near Montreal, supplemented by a number of native exhibits from New Brunswick, including apples and other fruits, as well as grains, etc. There will be two first-class coaches for the lecturing staff and assistants; one sleeping car and one dining car.

The Intercolonial Railway has arranged for the issue of return excursion tickets at single fare from all stations to the nearest point where the demonstration car will stop.

On leaving the Province of New Brunswick at Campbellton, the train will pass under the jurisdiction and control of the provincial government of the Province of Quebec.

The dates and hours over the Intercolonial system and which intending visitors to the cars and lectures should preserve, are published as follows for the convenience of farmers and those interested.

FRIDAY, JUNE 21.—Train leaves Fredericton on the Canada Eastern Division of the Intercolonial and halts for lectures at Durham, Cross Creek, and Boiestown.

SATURDAY, JUNE 22.—At Doaktown from 9 to 11.30 a. m.; at Blackville from 13.00 to 15.00; at Millerton from 16.00 to 18.00; and at Chatham from 19.30 to 22 o'clock.

MONDAY, JUNE 24.—At Sackville from 9 a. m. to 11.30 a. m.; Memramcook 13.30 to 16.00; and at Moncton from 19 o'clock to 22 o'clock.

TUESDAY, JUNE 25.— At Salisbury from 9.30 a. m. to 11.30 a. m.; at Petitcodiac from 13.30 to 16.00; and Sussex from 19.00 to 22.00.

WEDNESDAY, JUNE 26.—At Norton from 9 a. m. to 11.30 a. m.; and Hampton from 13.00 to 15.30.

THURSDAY, JUNE 27.—At Harcourt from 13.00 to 15.30; at Rogersville from 16.30 to 18.30; and at Barnaby River from 19.00 to 22.00.

FRIDAY, JUNE 28.—At Bathurst from 9 a. m. to 11.30 a. m.; at Nash's Creek from 13.00 to 15.00; at Charlo from 16.00 to 18.30.

SATURDAY, JUNE 29.—At Dalhousie Junction from 9.00 to 11.30; and at Campbellton from 13.30 to 16.30.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

It provides only that the barrel shall be not less than a certain capacity. Any larger barrel is perfectly legal. It is not like the case of the apple box in which certain dimensions are specified. We are glad however to have your Resolution and the whole matter will receive consideration at the proper time.

Yours truly
(signed) J. A. Ruddick
Commissioner.

The various phases of the so-called "Barrel Question" have been a fruitfull topic for discussion for the past twenty years. To settle it by law appears to be an impossibility. The problem is in a fair way, however, to work itself out in the light of the experiences of thelast shipping season. In Nova Scotia, the shipping of the Nova Scotia apples in Ontario barrels as they are called, was first advocated by buyers from Ontario operating in the Valley. In 1903 I think it was Messrs. J. C. and Max Smith, who first began to send regular supplies of N. S. apples to the Liverpool markets. Eglish opposition to change is well known and Liverpool apple buyers have all the national characteristics. The N. S. package was a new one on them and looked to prejudiced eyes about the size of a nail keg. So sales were made on a quotation from two to four shillings below the price brought by the same quality of apples packed in the hundred and twelve quart barrel.

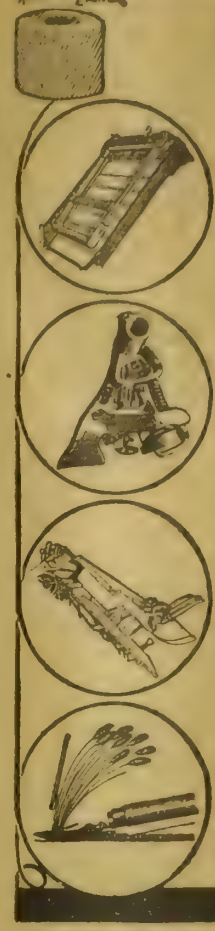
By weighing a number of barrels of apples and taking the average it has been found that eighteen pounds is the usual excess of fruit contained by the large barrel over the small or 96 quarts minimum barrel. This eighteen pounds of fruit is worth twenty-six cents figured out at two dollars a barrel. To date the cost of packing, heading, freight and all charges on the other side have been practically the same for both the large and the small barrel. The difference in cost of the package is about offset by the fact that the contents of eight Nova Scotia barrels can be shipped in seven Ontario barrels. On the face of it, it looks as if the Englishman was willing to pay from fifty cents to a dollar for twenty-six cents worth of fruit, provided he could have them the way he wanted them. As a practical test of the question, in a small way, the Co-operation Fruit Co., at Port Williams, last winter tried a few experiments. Seventy-five barrels of Ben Davis were packed in Ontario barrels and the same number in N.S. barrels, all shipped on same steamer to same man in Liverpool. No. Ones and No. Twos were in the same proportions in each lot. In place of the usual address on the face of the barrel of Port Williams, N. S., Port Williams, Canada, was substituted. This shipment made two shillings more for the large than the small barrel. The next shipment was for the same number of barrels and, sent under the same conditions as before as to equality. This time Nova Scotia was stenciled in place of Canada. This shipment made three shillings more for the Ontario barrel for No. Ones. The freight in every case was the same. The Ontario barrels were imported from Ontario at a cost of forty cents. Later a shipment was made in the flat hooped potato barrel known as the Chlie barrel which holds about the same quantity as the regular Ontario barrel. Perhaps this was the most interesting experiment of all, the "Chilie barrels" of apples realized two shillings more than the regular N. S. apple barrel. This difference was however, in all cases only for No. Ones. The difference on No. Twos was not nearly so great. So the results of the experiments this Company plan next season to make more shipments to Liverpool and Glasgow in the hundred and twelve quart barrel of their No. One grade.

On the other side of the question, we can say in favor of our N. S. apple barrel that it is perfectly suited for our local market and for Newfoundland. Our package is not discriminated against in London as it is in the markets of the north of England. The buyers from Hamburg that operated so extensively in the Valley last season would only offer a premium of twenty cents for the large over the small barrel. It seems as if there was a place for both packages, and that the recommendation made by the delegates to the Ottawa Fruit Conference was the only way out of the difficulty. It is an axiom in business "to give the buyer what he asks for." We have to cater to each market according to the individual requirments of that market. That is good business as well as common sense.

Shippers to Montreal and other Western markets found about the same difference in the two packages there as is found in Liverpool. Experiments along the same line as that of the Port Williams Fruit Company by other Companies next season would help to show what is the best package for each Market.

M. K. E.

Buy a McCormick Binder and Be Satisfied



IT took years to develop the McCormick binder. The final product of these years of development is the Hamilton-made 1912 Canadian McCormick, the satisfactory binder. Daylight is too precious during the short harvesting season for a farmer to run risks. You must have a machine which will do the work free from interruption, free from delay, whether it be by breakage or faulty binding. A binder has to do more delicate work than any other similar machine. It has to perform a highly complicated mechanical operation when cutting grain, elevating it, and tying it into bundles under all sorts of conditions. To do this many separate parts have to be put together and adjusted on every binder so that it can pick up tangled grain, and leave a clean field.

Only the most carefully graded steel, the toughest iron, and the most conscientious workmanship can stand this strain year after year. That is why the McCormick machine is the safest for you to buy. Every chain link is proved and every working part examined, inspected, and tested before the machine is packed for shipment.

Call on the McCormick agent and inspect the McCormick binder. Ask him to show you the complete McCormick line of harvesting and haying machines and binder twine. Get catalogues from him or write to the nearest branch house.

Every Home Will Welcome An

ENTERPRISE MONARCH STEEL RANGE

For every home, large or small, needs just such a range in its kitchen to get the results desired. These results are :—

Good Baking with small Fuel Consumption—
Secured in the MONARCH through perfect damper control.

Good Broiling without smoke and odors
—Secured through the MONARCH Broiling Attachment.

An oven that will retain the heat while the contents are being inserted, tested or removed --- Secured through the ENTERPRISE HEAT ECONOMIZER.

An Oven that will bake accurately without the worry of constant watching--- Secured through the Enterprise Oven Thermometer and Guide.

These are just a few of the good results obtained through using the MONARCH. Call on our nearest agent and examine for yourself this fine example of the stove makers' art. If you cannot call, drop us a line for illustrated circular and particulars.

Manufacturers Sackville, N. B.

DAIRYING.

Practical Ways ot Grading Gream.

There is a growing demand for high grade dairy products and especially for butter. For that reason the question of grading cream at the creameries and paying for it according to quality will continue to be a live issue, because no buttermaker is able to make a first class piece of butter from poor, partially decayed cream, and the cream producers never can be satisfied until they are paid according to quality of their product.

BUTTER PRICES.

It is plainly evident that the markets distinguish between the various grades of butter by fixing a price upon the first grade butter. A little study of the market reports from day to day will convince the most skeptical that the prices on the butter markets follow the demand for the highest grade and variation in price is a reliable index to quantity of first grade butter at hand on the particular day. A glance at any of the large butter market reports will show a difference in price of from 2 cents to 12 cents per pound on the various grades of butter. This fact alone should convince the producers of cream that the consumer demands good quality and is willing to pay for it.

Another fact of great concern to the dairymen is the preference of the consumer for oleomargarine in place of poor grade butter. Low grade butter moves slowly on the markets, consequently the creamery contributing to that supply must wait for returns. This in turn reacts upon the producers and naturally effects the whole community.

FARMER'S END.

The improvement of cream must of necessity begin with the farmer's end of the business because it is a long settled fact that no buttermaker can produce a first grade piece of butter from a raw product of low grade. However it is an equally settled fact that no farmer is going to the trouble to produce first grade cream unless he is assured compensation for his trouble. This is the key to the whole situation and the foundation stones will need to be laid around this very point. Every creamery organization needs to recognize this fact and govern accordingly.

PREMIUM.

Perhaps every creamery will need to vary their methods a trifle to conform to local conditions, without losing sight of the object in view. In many places where cream grading is in vogue, the common plan is to pay 2c. premium per pound of butterfat for the first grade cream. This is an incentive for each patron to bring cream of the first grade, for a 5-gal. can of cream testing 25 per cent. will contain about 10 pounds of butterfat and at 2c. will return a premium of 20c. per 5-gal. can, 32c. per 8-gal. can and 40c. per 10-gal. can

There are several methods in vogue at various creameries which give excellent satisfaction. In places, 3c. premium is paid in summer and 2c. in winter. This plan tends to insure more frequent delivery in summer when conditions are not so favorable to keeping cream. As a rule, a uniform 2c. premium throughout the year works very satislactorily. Frequently 1c. additional premium is given in the winter time on certain days in order to induce all the patrons to deliver on the same days. Such an arrangement makes it possible to get in enough cream so it can be churned immediately and in larger amounts, thus cutting down the operating expenses.

CREAMERY END.

The management has to handle the creamery end of the business. The object of the management is to get the most for the output of the creamery. To do this will necessitate the securing of a good raw product, expert workmanship on the part of the buttermaker and judicious management of the creamery.

GRADE LINE.

The most difficult point in connection with cream grading is to draw the line between first and second grade cream. As is well known, the average patron is not qualified to distinguish between cream that will make a first grade piece of butter and cream that will not. For that reason some arbitrary means need to be agreed upon as a guide. At present, the most satisfactory method is to draw the line between sweet and sour cream, putting all sweet cream of clean flavor into grade first, all sour cream reasonably clean in odor and flavor into grade second and rejecting all cream not fulfilling these requirements. The grade line is one thing that of necessity needs to be adhered to strictly, otherwise the creamery management is bound to lose patronage.

Frequently, it is necessary in grading to convince a patron that his cream is not up to first grade. A good way for the buttermaker to do is to have a small quantity of real good fresh cream and allow the patron to compare his cream with it by tasting. A few such trials will usually convince the most skeptical and result in retaining the patron at the creamery.

CHURNING.

Whether the buttermaker will need to churn the two grades of cream separately, will need to be determined by the circumstances. In many places the cream is mixed and both grades churned together, while in other places the grades are churned separately. The usual experience is that the second grade cream will be replaced by the first grade cream as soon as the patron acquires the knowledge of how to care for his products, because he will want the 2c. premium. But the grade line will need to be drawn sharply and adhered to strictly even if one or two patrons are lost to the creamery.

Every farmer who produces cream needs to insist upon the premium of from 20 cents to 40 cents per can, and the only way to get this is to establish a cream grading system. If every cream producer would figure how much his premium would amount to in a year there is no question but every creamery would be grading cream and paying according to quality this year.

A great many creameries in Minnesota and the Dakotas established the grading system of paying for cream and in every case where it was done in a practical way, the creamery prospered and the patrons were highly pleased. This is a good time of the year to establish the grading plan and every creamery will do well to fall into the line.—N. D. Col. of Agri.—G. L. Martin in Hoard's Dairyman.

Dairy Notes.

Cleanliness is the keynote in good dairying.

Concrete vats in the milk house are reasonably cheap, eternally durable, and highly sanitary.

The cow gets up on her hind feet first, with head down. For this reason the manger should be low and the cow allowed enough freedom in her stall so that she can rise with ease.

Some Features We've Told You Little About

In our previous advertisements the big features of the Standard have been emphasized. You've heard a great deal about the Enclosed Dust-Proof Gearing—The Self-Oiling System—The Centre Balanced Bowl—The Liberal Space Between Disc Edges and Bowl for Holding Accumulation of Impurities—The High Crank Shaft—The Low Supply Can—of the

Standard

cream separator. But there are other features that add greatly to the convenience and satisfaction of Standard owners.

For instance, there's the Wide Open Bowl so easy to get at and wash. No tubes to clog up either. Then there are the Discs which are all washed together on a disc holder in about one minute. They are numbered so they cannot be put together wrong.

Then, too, the Standard Bowl doesn't leak. That's because the bowl shell fits tight without screwing down on top of a rubber ring, causing wear on the rubber and allowing the milk to leak through when the bowl is revolving.

Another good feature is the Interchangeable Clutch which permits the Standard to run down without wear on the working parts. Note:—When you stop the crank, the gears all stop and the bowl runs down of its own accord and without wear. The Interchangeable Clutch also enables you to "Pump" the handles and start the machine quickly and easily.

But there are other features—many of them—told about in our booklets. Write for them. They are free to all progressive dairymen and women.

The RENFREW MACHINERY CO. Limited

Head Office and Factory, Renfrew, Ont. Sales Branches, WINNIPEG, Man. and SUSSEX, N.B.

You are going to buy

a Cream Separator this year. You have your choice of a number of standard makes, including the famous

EMPIRE

Cream Separators

which will do some things others won't do—because Empires have some patented features that have never been successfully imitated, although competitors would gladly copy them if it were not for Empire Patents. Just what these features are, is fully explained in the Empire booklet.

Get a copy---Learn the facts

If they interest you deeply, as we believe such facts will, go to our agent in your locality (we will furnish you his name) and tell him to deliver an Empire to you for Free Trial, without obligation on your part to buy, unless it is proven to you that the Empire fulfills our claims. We are willing to let the Empire demonstrate its efficiency to you. It's your ultimate choice—the machine you'll buy sooner or later. Just hasten that day by writing to us by first mail.

Another Theory Wobbles.

It seems that in order to keep up with the procession of advanced dairy thought we must be perpetually throwing aside beliefs no matter how deeply rooted and implicitly relied upon in the past and pinning our faith to new doctrines, or old doctrines under new colors. We must unlearn as well as learn and the frequency with which we are compelled to perform the former feat makes us shudder to think how many false gods we are now granting a place in our temple of truth. This we offer as a tentative obituary notice to the theory of the cause of mottles which we had grown accustomed to accept as pretty conclusively proven but which now seems in imminent danger of being exploded. We had accepted the exhaustive experiments of the New York Experiment Station, made several years ago, as a very plausible demonstration that mottles were primarily the result of an uneven distribution of buttermilk or casein in butter, that the lighter areas owed their blond shade solely to the pres- of a larger percentage of the protein elements of milk. But now comes a report from the Wisconsin Station that mottles have been produced at will in casein-free butter, simply by a failure to thoroughly distribute or render homogeneous, the mixture of butterfat salt and water. The Wisconsin investigators take this as an indication that the occurance of mottles may be wholly independent of the presence of casein and that uniform working of the butter is under all conditions of the utmost importance in seeking to eliminate the trouble.— N. Y. Produce Review.

The Calf's First Milk.

Nature has provided something in the first milk that is very essential in getting the calf's digestive machinery started right, and I think it should be permitted to have it. We usually leave the calf with the cow a couple of days, until it is nicely straightened up, then comes the most important time in the life of the calf, when we take upon ourselves its feed and care; and here is where we want to exercise a lot of kindness and gentleness, for if we are impatient and rough in our treatment with them they wil, distrust us and fear us, and the chances are they will never forget those first lessons and impressions. A cow will never do her best unless she has perfect confidence in us.

It is an old saying that you can catch more flies with molasses than with vinegar; so you can do more by coaxing than driving. When teaching the calf to drink, don't push its head into the pail; wet your fingers in the milk and let it suck, and coax its head into the pail, and usually the second or third time it will drink of its own accord.

ESSENTIALS OF CALF MILK.

These are three essentials at this time: The quantity of milk, the temperature and quality. Calves are injured more by not observing carefully these rules for the first few weeks of their lives than any other way. At this age their little stomachs are not strong, and a little care exercised at this time often means the difference between an unprofitable and a profitable animal.

The amount of feed at this time will depend largely on the calf and somewhat on the nature of the milk. This amount must be determined by the feeder, but this precaution is always advisable—better to begin carefully and work up to what they can handle, rather than to begin with a large amount and get them off their feed and then have to commence all over again.—F. H. Scribner, in Holstein Register.

SHE PAID To Escape These Disks!

We have in our office, this very minute, the letter telling how the plucky woman here mentioned paid her hard-earned money to escape washing these disks.

One Difference Between Tubulars and Others

Letters come to us telling how plucky women pay hard-earned money out of their own purses to escape washing disk-filled cream separators. Here is just one such instance: A lady and her husband decided to have a cream separator. He thought only of the purchase price and refused to pay more than the cost of a cheap, disk-filled machine. Like other women, this lady could not bear the thought of washing 40 or more disks twice a day. She wanted the wonderful

SHARPLES Dairy Tubular Cream Separator

She knew that Dairy Tubular bowls contain only the little piece shown in the right-hand pan and are the only easy-to-wash separator bowls. She also knew that Tubulars have twice the skimming force and skim twice as clean as others—thus paying more every year in extra profits than could be saved through buying any cheap machine. So, to what her husband was willing to pay she added enough hard-earned money from her own slender purse to buy a Sharples Tubular. And now she is one of the happiest, most contented separator users you ever saw.

What greater praise could be given Tubulars than the fact that women so greatly prefer Tubulars that they will pay to escape washing other machines? **Ask for Catalog No. 194**

Sharples 31 Yrs

Do you want a free trial? Do you want to exchange your old separator in part payment for a Tubular? You can do either.

LIVE STOCK.

At What Age Should Heifers Be Bred?

Opinions differ very materially on this question. The prevailing practice of late years, especially in dairy cattle is to have them drop their first calf at 24 months, then to have a long period of lactation, sometimes as long as 15 or 18 months before she drops her second calf. This practice is said to be of great aid to long milking periods in the future cow. Whether or not this really is the case, and there are quite a number of good reasons for believing that it is the case, still the fact remains that the added gain in milk production is often overbalanced by the harm which accrues from breeding the heifer at this early age. Again, however, the argument is put forward, that it is much easier to get the animal to breed at an early age, than if deferred later. When breeding is put off til, 30 or 33 months, the cow is generally too fat, and the generative organs sometimes fail to act. It is a well-known fact that more calves are dropped at two years old, than at three, but if care is taken not to have the females in too good condition when served, there is no reason why they should not be just as prolific at this later age.

To go back to the first stage of the question, the argument is also put forward that stockmen who raise high priced cattle must have some return for their money invested, and thus they breed the heifers early to have young stock for sale.

Then this side remains: does the heifer not suffer in growth and development by early breeding. She has the extra tax on her system, of sustaining the foetus. This she has to do at the expense of her own growth, and the result will be a mature cow with diminished size and vigour. Possibly we may not notice the lessened vigour, but it is there nevertheless. Moreover the progeny of the early bred heifer will never attain the strength, size and development of the heifer whose calf comes at 30 or 33 months. This drawback is in our opinion scarcely balanced by the increase in milk production already referred to. These remarks apply more particularly to dairy animals as heifers of beef producing breeds are not bred quite so early.

Conception in young animals can take place at a very early age, and care ought to be exercised not to allow young stock of both sexes to run together, as generation in the male animal is possible at as early an age as six months.

Young animals getting in calf at too early an age are generally ruined for milk on beef production.

When the heifers are to be served, large and heavy bulls ought not to be used on them as permanent injury may follow to the smaller animal. A lighter and less mature bull should be got. Much attention should be paid to the food of pregnant animals, especially if they have been bred young, as the heifer must sustain the young embryo, as well as build up her own frame. Foods rich in ash, for bone and firmness, are needed, such as clover or alfalfa. Too much protein and not enough carbohydrates results in an overgrown calf while yet unborn, and weak in vitality at birth. Too much carbohydrates and too little ash, results in undersized calves.

Grass, roots, etc., are the best foods to give, and they ought to be fed liberally as it is important for the young heifer to be in good flesh at the time of her first calf. When cattle are at pasture, no addition to the grass should be necessayy; in winter the food should consist of good hay or clover and about 10 to 20 lbs. of roots daily with some bran or chop. Mature cows should not be in too high condition at calving time as there is danger of milk fever, this malady, however is common in Canada, and can be easily cured if steps are taken in time. While we recommend that the young heifers should be in good condition, it is well to see that they are not too fat as difficulty in calving may be experienced. Another point of great importance is to see that the animals are not constipated when nearing parturition. There are more good cows lost through carelessness to observe this caution, than through any other cause. Give plenty of good succulent food and a bottle of linseed oil, or a dose of salts shortly before calving time, will put the bowels in good working order.

Generally there is a little trouble with heifers, the first few times they are milked; the udder may possibly be a little inflamed and swollen and some hot fomentations and gentle rubbing will prove greatly beneficial.

Young heifers will generally resent milking operations, and will kick pretty freely. If the animal has been used to being handled, and spoken to gently she will soon get over it, and submit to be milked, as soon as she finds out the soothing effect of the milking

There are many methods of dealing with the kicker; tying her feet with ropes, holding up her forefoot, and others, but of all the methods we have tried or seen tried, there is none which gives such good results as gentleness. Gentleness has cured many a vicious kicker, and there is absolutely no use of any one trying to cure a kicking heifer, who has not perfect command of his own temper. Paying the animal out with the milking stool, the fork handle or the boot, is a poor method of trying to cure a kicker. Fearlessness is essential; it is wonderful how quickly animals recognize that we are afraid of them. Moving quietly about the animal, speaking gently to her, rubbing her udder and when milking, keeping the head firmly wedged in against the animal's hind flank at the same time having some one scratch her gently between the horns, will generally result in her docile submission after the first few attempts. However should she develop into a confirmed kicker, the best way is to fatten her for the butcher; life is too short to be bothered with kicking milkers. We have had considerable experi?nce with kicking milkers and can safely say that nothing succeeds like continual kindness.

After the birth of the calf, the heifer should be put on a fairly low diet till all the dangers consequent on calving, and milk fever are past, after which her ration should be generous.

After the birth of her first calf, the heifer will usually come in heat in from six to twelve weeks. Many stockmen think it unwise to have her served the first time, and wait for the second period. Heifers bred young are allowed to run quite a while before being bred again, in order to facilitate their growth and make up what they have lost. Whether this is a good plan or not opinions differ; suffice it to say that cows bred a reasonable time after calving, are more likely to be in calf and to breed regularly than those that are not served until some considerable time has elapsed.

To sum up the whole question, we would say that it is more advantageous to have animals as mature as possible before breeding them, in order that we may have an offspring produced by animals of maximum vigour on both sides, and thus the standard of our herds will not be lowered by raising stock which are undersized, or in any way immature.

FELL FROM A HAY LOFT

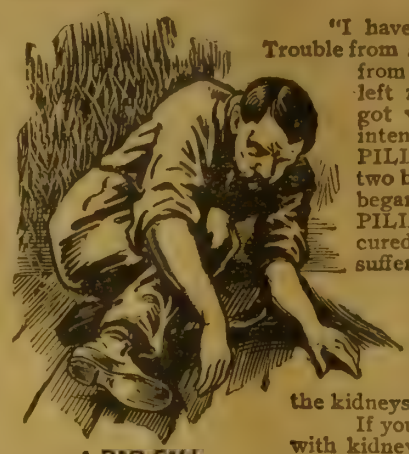
Suffered Tortures With His Kidneys Until He Tried Gin Pills

You might think that Mr. Baker needed a surgeon more than GIN PILLS. But there were no bones broken. His back was strained, which was harder to cure because nothing seemed to do any good. It is the same with a sprained ankle and broken leg. You can set the fracture and it will be well in six weeks —but the sprain may take months to get well.

However, Mr. Baker found the quick way to get relief from the pain—here are his own words.

AULTSVILLE, ONT.

"I have been a great sufferer from Kidney Trouble from an injury to my back caused by falling from a hay loft about six years ago. This left my kidneys weak, so that every cold I got would settle in my kidneys and cause intense suffering. I was advised to try GIN PILLS. I found, to my surprise, after taking two boxes, that the pains were relieved and I began to feel better. I am still taking GIN PILLS and feel sure I will be completely cured. I recommend GIN PILLS to all who suffer from any Kidney Trouble". C. BAKER.

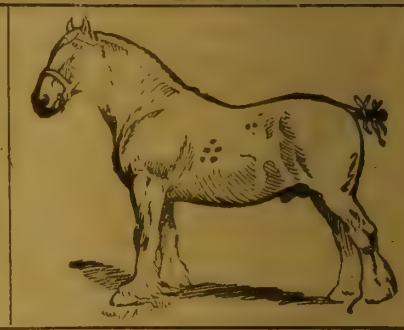


A BAD FALL

You see, the fall had strained the kidneys and they were affected by the slightest chill. GIN PILLS immediately strengthened the kidneys—soothed any irritation and thus enabled the kidneys to overcome the effects of the fall.

If you are having pain in the back—or trouble with kidneys or bladder through accident or overwork—do just as Mr. Baker did—take GIN PILLS. They will help you—cure you—or we will promptly refund your money. Buy six boxes at your dealer's. If, after taking them, you feel that Gin Pills have not helped you, return the empty boxes and get your money. We will take your word for it. 50c. a box, 6 for $2.50. Sample box sent free if you write National Drug and Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS regulate the bowels and cure Constipation, Biliousness and Indigestion. 25c. a box. 111



WHAT DO YOU THINK OF THIS, MR. FARMER?

The Farmers in Manitoba, where Middlings and Bran are manufactured, use MOLASTINE MEAL. MOLLASINE MEAL, on account of the very high rate of freight from here to Manitoba, costs the Farmer in Manitoba very much more than the Farmer in the Maritime Provinces. On the other hand, Middlings and Bran are very much cheaper for the Farmer in Manitoba.

What beter argument can be produced than this? Read the following letter from a large Stock Owner in Manitoba, which is self explanatory.

"I dont want to put Molassine Meal up too high, but I believe it is a good thing. Last June, July and August, I used a considerable amount of it, especially with my Dairy Herd. The results were self-evident of Molassine Meal not only being a good Milk producer, as far as quality and quantity are concerned, but that it also keeps my Cows in first-class condition. The quality and quantity of the Milk was sufficient to warrant the Judges at the Winnipeg Exhibition awarding me a first and second prize in aged Milk Cows, and a second and third in the two year old cows, also on a Milking test. I feel sure that the feeding of Molassine Meal is materially responsible for the winning of these prizes. So much so that I have one cow that I was trying out to see whether the entering of her for the Milking Test was feasible or not, and was feeding her on Molassine Meal. She was producing 98 pounds of Milk per day. I ran out of Molassine Meal and was not feeding it for a few days and her supply of Milk dropped 9 pounds a day. Immediately, upon starting to feed Molassine Meal again she came up to the original production.

"I think everybody should feed it and I herewith enclose you an order for another supply." H. HANCOX,
Roseau View Stock Farm, Holstein Friesian Cattle. Dominion City, Manitoba.

Your dealer has Molassine Meal, as all up-to-date dealers have. Should he be out, we can supply him immediately. If you have not fed this Feed, we are convinced you will buy at first opportunity. Put it on your list of wants NOW, and get it the next time you are at the store.

Gid or Sturdy in Sheep Caused by Dogs

This is caused by hydatid on the brain, these being the cystic form of the tapeworm of the dog, and look like watery bladders, varying in size between a bean and a hen's egg. Yearlings are more liable to it than older sheep, and although invariably fatal it is fortunately not infectious. The best authorities have now come to the conclusion that Gid cannot exist without the presence of dogs to harbor the fully developed creature which is expelled in the herbage, and then swallowed by the sheep. All dogs are liable to tapeworm, even those carefully fed and well kept, while those carelessly fed are always more or less affected. During the summer months, dogs are able to rid themselves of tapeworms before their own health is seriously affected, and at this season the risk of sheep swallowing those numerous discharged tapeworms is greatest.

The early symptoms of Gid can only be detected by a keen and experienced shepherd, but the disease soon becomes apparent to the casual observer. The affected animal moves round and round in a circle, is very dull, separates from its fellows and generally holds its head high in the air. It is a most distressing ailment to watch, not to mention the excruciating pain endured by the sheep.

There is no cure for fully developed Gid except trephining and the operation cost fully the price of the average sheep. If the animal is slaughtered as soon as the symptoms are observed, the carcass may safely be used for food, but the head should always be burned and not buried. When the disease is far advanced the carcass is unfit for food.

It wil therefore be seen that in addition to worrying sheep, all useless dogs are a constant source of danger in any farming district.—W. T. Ritch. Ritch.

To Polish Horns.

Subscriber, suggests the following method of polishing the horns of cattle for show as one which he used with excellent results. He uses the coarse rasp first and then the fine rasp after which he scrapes the horn with glass and next uses both the coarse and the fine sand paper or emery cloth. After finishing the smothing process with these he uses the leather strap with powdered charcoal, using the flesh side of the strap on the horn at this time. He then reverses the strap and applies it diligently to obtain a perfectly smooth surface and when this is obtained, applies sweet oil with a woolen cloth as the finishing touch. The thorough and diligent application of the leather strap and the woolen cloth he holds as important parts of the work saying that "elbow grease" must be applied without stint.— Wisconsin Agriculturist.

Wool Balls.

The habit of wool eating is responsible for the trouble known as "wool balls" in lambs' stomachs. The trouble is worst in long wool breeds, and is usually ascribed to lack of salt or some other necessity in the ration. Digestive troubles are also responsible for the habit. Ticks may be instrumental in forming the habit. A lamb bites his sides to scratch a tick bite and gets a taste of wool.

The wool should be clipped from the udders of the ewes before lambing so that there will not be any temptation on the lamb's part to get this habit. Close confinement should also be avoided. Where the habit has taken hold of a flock plenty of range should be allowed and the ones having contracted the habit separated from the main flock. Doses of linseed oil may give relief, though the blocking of the small intestines is serious and a frequent cause of death.

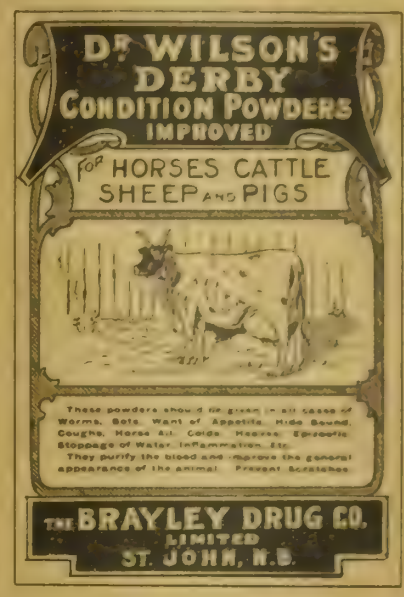
Canada's Leading Stock Men Strongly Recommend the use of

Dr. WILSON'S DERBY CONDITION POWDERS

for Horses, Cattle, Sheep and Pigs

The names of the successful Stock Breeders whose testimonials appear in this advertisement, are household words in the Maritime Provinces. They are some of the leaders who are setting the ideal to which progressive fellow farmers aspire. They are authorities on the care and management of Live stock.

Read what they say about Dr. Wilson's Derby Condition Powders, the best Live stock conditioner on the market as it purifies the blood and improves the general appearance of every animal to which it is administered.



Amherst, N. S., July 10, 1910.
The Brayley Drug Co., Ltd.
St. John, N. B.

Gentlemen: It affords us great pleasure to let you know of the great success we have attained by the use of your Condition Powders. We have been feeding them for some time back and are satisfied that they are as good as you claim them to be and in our estimation there is no better in these parts.

Wishing you continued success, we are,
Yours truly, LOGAN BROS.

THE HORSE.

The Shape of Horses Feet.

The two chief points to be taken into consideration in judging whether a horse has good feet are their size and their general shape. Broadly speaking, the principle may be laid down that they should be comparatively big in heavy cart horses and medium-sized in the case of horses belonging to the lighter classes, although even in these it is better to have the hoofs on the big side than on the small. Very small and too large feet are both faults, the former, however, being the most objectionable, particularly so in draught horses. There need never be any difficulty about telling whether a horse's feet are of correct size or not, because if unduly small or abnormally big, they look out of proportion in comparison with the limbs and the general build of the animal. The reason why one looks for comparatively large-sized feet in horses of heavy cart breed is because their feet and massively proportioned body imposes a great weight on the limbs. If the hoofs are small, the strain imposed upon them in having to support the heavy weight of the cart-horse's body is considerably increased, as it is not spread over such a large ground surface. Over-large feet in a horse of light-legged breed are generally the mark of the underbred animal, this feature mostly being derived from a cross with the cart horse, and in the majority of cases such feet lack toughness, and are none too well adapted for standing fast work on hard roads. Unduly big feet occur only infrequently in light horses of pure breeding—that is to say, those without any strain of coarse blood in their veins— whereas the opposite fault, viz., small hoofs, is a good deal more commonly seen in them. Hackneys, in particular, often have unduly small feet, and very generally it may be observed that this failing is associated with lightness of bone below the knee and hock, and with small, narrow fetlock joints. Small and shallow hoofs are also a defect frequently met with in cart horses, although it is satisfactory to note that the breed has been considerably imoroved in this respect of recent years, thanks to the wide use which is nowadays made in most districts of good-class pedigree stallions for mating with the ordinary farm mares. In the fashionable show strains of Shires this fault has been largely bred out since the Stud Book was established.

As regards the general shape of the feet, it is desirable that they should be sufficiently deep, symmetrical, and wide at the hoof-head, while they should have the right degree of slope, being neither too upright nor too much sloped. Upright feet are always too high in the heels, and very often the latter are also contracted in this case, making the foot look very narrow. That is a serious defect. Narrow, upright, contracted feet are often referred to as "donkey's feet," and are usually considered to be specially liable to be attacked by laminitis or founder. What one likes to see is an open and wide heel, with an expansive and prominent frog. But, on the other hand, the heels must not be too low, that comprising a grave objection. Low heels are associated with flat feet of very spreading and shallow shape, and hoofs of this kind are inherently weak and wear badly. They also more often suffer from brittleness of horn than normally shaped feet. Such flat feet usually occur among horses of heavy breed and those with a strong cart-horse cross in them. A good foot should have an arched sole, this being an important indication of strength. In frequent cases where the soles are flat they have become so as the result of disease in the foot, and in extreme instances the sole may have dropped to such an extent as to bulge outwards, so that it is of convex shape. This, needless to say, constitutes unsoundness. While corns are liable to occur in all horses quite irrespective of how their feet are shaped, it is generally found that those having either upright and narrow hoofs with high heels or else flat and low-heeled ones are more than ordinari,y susceptible to suffer from this complaint.

A level wall is usually considered an essential feature in good sound feet, but occasionally there may be a slight bulging at some part of the wall or other without its in any wise impairing the strength and soundness of the hoof. Such slight irregularities are to be met with in the toughest of feet, and therefore no undue importance need be attached to them when they occur, provided always that the hoofs are otherwise of satisfactory shape and size. In horses that have been running at grass for a lengthy period, the horn of the hoof-wall very generally shows more or less noticeable ridges, these being what are known as "grass rings." They are of no consequence having been produced in the natural course of things, and will disappear after a time when the horn has grown down and more and more of the old horn gets pared away at each successive shoeing. Very different from these grass rings are the ridges or rings, growing very closely together, which characterize the feet when a horse is affected with laminitis.—Farm and Home.

Horses That Scour.

This is a question frequently asked: "A fine young horse, a perfect picture of health, eats well and feels well and is full of life. His bowels and kidneys act perfectly when standing in the stable or when doing slow farm work. But when driven to town, a few miles away he will begin to scour after being driven a few miles. How can I prevent this?"

Such a case is different from that of an animal troubled when idle in the barn with looseness of the bowels and is out of condition. When the horse eats dry hay and grain during mastication it is moistened with saliva, and when it enters the stomach it is a half dry mass of chewed hay and grain. Here it is churned in the stomach and further moistened with the gastric juices. Then it passes to hee first part of the intestines, called the duodenum, and sometimes called the second stomach of the horse. In this part of the intestine the bile from the liver and the fluids from the pancreas further moisten the food, until it becomes a thin, sloppy mass, when it is in shape for the small tubes, which the lining membranes of the intestines are covered with—lacteals, so called—to suck up the nutrients of the food and carry them into the blood and by it to all parts of the body to build it up.

When the food is inthe fore part of the small intestines, if water is furnished a thirsty horse, it is rapidly carried through the small intestines (about seventy-five feet) to the large intestines too rapidly. Thus some scientists object to watering a horse as soon as he has eaten his hay and grain; but it really is better to give him water then than after he has been driven several miles before offering him water. Water given as drink does not mingle with the food that is in the stomach to any large

A GREAT SCANDAL

Big Efforts to Hush the Matter Up-- The Truth Out At Last. . . .

From exhaustive enquiries made during the last few months we find there have been a number of patients kept under conditions which to say the least of it, is a great scandal.

We trust our readers will bear with us for a moment. The facts of the matter are these, there have been some thousands of cases where horses have been suffering from distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements, of all kinds, and in some cases no attempt has been made to relieve their sufferings, their owners either being indifferent, or where they have thought at all about their animals, have had recourse to cheap so-called remedies, of which there are unfortunately a few on the market, but which, while so may give a little relief temporarily, cannot from the nature of their ingredients give permanent relief or effect a cure.

It is high time in our opinion that something should be done to bring this state of things to an end, and with this in view we are about to take drastic action, to bring before every owner of horses that wonderful remedy known to all as "Dr. J. Woodbury's Horse Liniment."

This remedy has been used for years throughout the Dominion during which time it has been used in hundreds and hundreds of cases, comprising distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in no case to our knowledge, has "Dr. J. Woodbury's Liniment" failed to first relieve, and then to cure the above mentioned complaints.

Every owner of horses should, if they have not already got a bottle of this Liniment in their stable, immediately procure one. It is the only guaranteed remedy we know of, and it is a cheap form of insurance, and it will be found, that, if used immediately any symptoms of any of the above complaints appear, to give immediate relief, and probably save tremendous expense, probably the life of the horse as well.

Dr. J. Woodbury's Horse Liniment is sold by Stores and Chemists throughout Canada, but should your Store-keeper be out of stock he will procure it for you, and if you should find any trouble in getting a bottle, don't delay for an instant in mailing 25 cents and a bottle will be immediately forwarded you.

extent, as the opening into the stomach is only a few inches from the opening out of it. Thus most of the water drank by a horse goes right through the seventy-five feet of small intestines to what is called the "blind gut," or caecum, which is a reservoir for water to be used in further mixing with the food when it gets to the large intestines. When all food reaches the large intestines the lacteals (tubes with sucker mouths) begin rapidly at work to suck up the nutrients that have been so digested. The contents of the large intestines are pushed along by muscles which contract and relax around them (peristaltic muscles). It is the action of these muscles that pushes the food that has been eaten through the intestinal canal.

Now to the point: A little nervous excitement will, in some horses, cause these muscles to contract and relax so rapidly that the food when in the soft, watery condition will be expelled, and thus the horse scours until all of the food that is in the large bowels (colon) is evacuated. Thus it is that some horses that are full of life and spirit when started off at a rapid gait will soon begin to scour, and after a time will cease to do so. Horses that are daily used in harness of this class will usually get over it as they become used to the excitement of things they see on the road.

Another method of feeding and watering will in some cases prevent scouring. Water the animal before feeding in the morning and give no water afterward until he has been driven for from one to two hours, and then only a few swallows, and again a few swallows an hour later; and before his noon meal give him his full supply of water. In the afternoon drive practice the same. At night give him all the water he desires before he is fed, and after he has eaten his evening meal give him all the water he desires. Right here is a point in feeding and caring for horses that is generally overlooked. At night all horses that labor should be given a full supply of water after they have eaten their feed of hay and grain.

Medication is of little value in a case of this kind. It is not a disease to be cured as a rule, but the result of a habit of feeding, watering and driving. Horses become nervous in more ways than one. It is not always the things they see that make them nervous, with a scouring. A nervous driver will excite any horse of spirit and be likely to cause him to scour. Putting an overdraw check rein on a naturally low headed horse, or using a bit that does not set easy in his mouth, causing him to be constantly fighting the bit by tossing his head or swinging his nose around to relieve an aching neck will also do this. Of course, there are horses with weak digestion and their food will pass through the intestinal canal undigested. Young horses from three to five years old, while they are shedding and cutting teeth, will frequently have looseness of the bowels from not properly masticating coarse food; or the feeding of a laxative food, like clover or alfalfa hay, will produce looseness of the bowels; but I am speaking of the cases where the horse is not unduly loose in the bowels except when driven on the road and at work or when idle. This can be controlled by practicing the methods advised and not by drugs.—C. D. Smead, V. S., in Tribune Farmer.

When your child has whooping cough be careful to keep the cough loose and expectoration easy by giving Chamberlain's Cough Remedy as may be required. This remedy will also liquify the tough mucus and make it easier to expectorate. It has been useds successfully in many epidemics and is safe and sure. For sale by all dealers.

Fattening Draft Horses.

It is commonly estimated that young draft horses gain in value when fattened, at an average rate of $25 a hundred pounds of gain. Of the common feeds used oats and hay are considerably more expensive than cottonseed meal and silage, in the amounts used to make a suitable ration.

The comparative fattening values of these rations have been reported by Prof. W. A. Cochel, in the Pennsylvania Experiment Station's annual report. Prof. Cochel draws his conclusions from an 84-day experiment with 24 horses, four to eight years old, of Percheron and Belgium breeds and of the type known as "chunks," or "light draft horses." These were divided into three groups, similar in all essentials, and stall-fed, with little exercise upon the following rations:

1. Corn, cottonseed meal, corn silage (a. m.) and mixed hay (p. m.).
2. Corn, cottonseed meal, mixed hay.
3. Corn, oats, mixed hay.

The experiment showed that horses can gradually be accustomed to silage, and eat it safely when it is sound and made from mature silage corn. Some animals do not really accept cottonseed meal, though the number of such animals is relatively small. Silage-fed horses consumed less grain, and were better finished and sleeker than those fed hay as the sole roughage. The use also of cottonseed-meal resulted in higher gain and better finish than where oats was the principal source of protein.

The cost a pound of grain, was, at ruling prices for feed: 1, 13.4 cents average, range 9.45 to 19.83 cents; 2, 13.7 cents average, range 10.38 to 19.05 cents; 3, 17.77 cents average, range 11.53 to 29.63 cents, the wide range being due to marked difference in individuality. The most profitable horse for feeding purposes is one of the quiet temperament and of typical draft qualities—clean short legs, wide cannons, and deep, wide chest and middle.

Windgalls.

These puffy swellings about the fetlocks, thought by the ancients to contain air, but now understood to be bursal enlargements due to the effects of work, concussion, strain, etc. are a terrible eyesore, and a great source of annoyance to horse owners who like to see clean legs, and there is generally a demand for treatment to get rid of them. Such treatment is rarely very successful, and though the swellings may temporally disappear, they become as prominent as ever as soon as the animal is again subjected to the causes which organally produced them. We have often seen horses that have been blistered and turned out for six weeks in the spring of the year come up with their legs as fine as those of a colt, but as soon as they are put into work again the puffy swellings invariably reappear.

The best thing to keep down windgalls is regular bandaging and hand rubbing. There is no class of horse whose legs are subjected to greater strain than those of the thoroughbred in training, and there is no horse whose legs, taken generally, are cleaner, or more free from windgalls. This is largely attributable to the regular careful bandaging and leg massage to which they are subjected. They practically live in bandages. In every case where an attempt to get rid of windgalls is made rest is essential. Rest always allays the irritation of the parts involved, and with the cessation of inflammatory action which produces it the increased secretion of synovia ceases. Friction and pressure, by rousing the action of the blood-vessels and absorbents, assist nature to take up the extra secretion. In getting up for sale horses that show these signs of wear—you rarely see windgalls on the extremities of a "slug"—dealers employ pressure, friction, "sweating" blisters, slight dose of madicine, a laxative diet, and give only gentle exercise; but the purchaser, when he puts the horse to work, generally finds the enlargements reappear, the more quickly because the treatment of the dealers' stable causes the animal to become "soft." Horses showing windgalls derive much benefit from cold water irrigation, followed by brisk hand rubbing, and the application of Newmarket bandages with a firm, even pressure. What is known as the blister charge is useful in the case of hunters showing windgalls at the end of the season.—Pateley Bridge.

GOOD TRAIN SERVICE UNDER SUMMER SCHEDULE

I. C. R. Change of Time Table Went Into Effect June 2nd.

The summer time table on the I. C. R. which went into effect on June 2nd., gives practically the same service in and out of St. John as last year. Number 2 express leaves at 7.10 a. m. No. 4 the Boston train for Point du Chene leaves at 11.20 a. m., carrying through sleeper to connect with the Ocean Limited for Montreal. No. 26 which connects at Moncton with thw Ocean Limited for Halifax departs at 12.20. The Sussex Express leaves as usual at 5.15 p. m. No.123. Express the connection with the Maritime Express for Montreal, leaves at 6.35 p. m. No. 10 Express the night train for Halifax departs as usual at 11.30 p. m. The Sururban service is the same as last summer, No. 132 leaving at 9.00 a. m. for Hampton; No. 136 at 12.15; No. 138 at 6.15 p. m., and No. 156 at 11.00 p. m. On Saturdays the noon suburban will be held until 1.15 p. m. to accommodate the suburban residents who have the Sarurday half holiday.

There is no change in the arrivals; No. 9 Express from Halifax arrives at 6.15 a. m. connecting with the morning train for Boston. The Sussex train arrives as usual at 9.00 a. m. No. 133 Express, connecting with the Maritime Express at Moncton arrives at 10.40. No.25 Express, connecting at Moncton with the Ocean Limited from Halifax for Montreal arrives at 5.20 p. m. No. 3 Express the Boston train from Point du Chene carrying the through sleeper from the Oceon Limited from Montreal, arriving here at 6.35 p. m. No. 1 Express from Truro arrives as usual at 9.30 p. m. The Sururban arrivals are: No. 131 at 7.45 a. m., No. 135 at 11. 15, No. 137 at 2.40 p. m., No. 155 at 8.20 p. m.

Each age of our lives has its joys. Old people should be happy, and they will be if Chamberlain's Tablets are taken to strengthen the digestion and keep the bowels regular. These tablets are mild and gentle in their action and especially suited for people of middle age and older. For sale by all dealers

POULTRY.

Some Diseases of poultry.

HEART BAG, DROPSY OF.—A complaint of not very frequent occurence; the symptoms are a staggering gait and the head thrown backwards. Fowls so affected are generally unable to feed, and the best course to adopt is to immediately kill them and thus save them pain and misery.

Jaundice is decidedly common in Canada, especially in the hotter districts, and numbers of poultry undoubtedly die of this complaint. It is, we consider, generally due to the too continuous use of food which contains too much oil, such as mealies; it is also frequently aggravated by birds being kept in close confinement. In appearance the subject is listless and mopish; the face generally has a yellow tinge which occasionally extends to the comb and wattles. A post-mortem examination reveals an abnormally enlarged gall bladder and frequent discoloration of the adjoining organs.

The treatment consists of an entire change of diet from which all foods of a fatty or oily nature should be excluded. One authority advises purging the birds with one-half to one grain doses of aloes, whilst others recommend 10-grain doses each of sulphate of magnesia and bicarbonate of soda daily for four or five days. We have found, however that if poultry are fed with care, and sufficient change of diet is given, together with plenty of green food and a bi-monthly dose of epsom salts, there is not much chance of this complaint making its appearance.

Liver disease is a general term largely used amongst poultry-keepers, and in the majority of cases the trouble with the organ is due to congestion.

The causes are similar to those of jaundice, lack of exercise being in our opinion a common contributory cause, for we have noticed that, in the case of Anconas, Black Leghorns, Campines and such light breeds which are very active in their habits and are continually on the move, liver troubles are seldom met with, whereas troubles amongst the heavier breeds, which are by nature more or less lazy and sluggish, it is of frequent occurance unless such birds can be induced to take plenty of exercise. The symptoms are not very pronounced, but affected birds are usually sluggish, and the droppings are generally tinged more or less with yellow or green. As the disease advances, lameness is often noticeable, and this is usually followed shortly by death. In the treatment the same measure as suggested for jaundice may be adopted; we have also found one-half grain doses of calomel administered daily for two or three days very useful both for liver trouble and jaundice.

Pip can hardly be called a disease, for it is usually due to some other organs or organs being out of order, especially the stomach or respiratory organs. The hard, horny substance which forms on the tongue causes considerable pain and inconvenience, and one cannot be surprised that the fowls fall in condition for the hard, sharp edges of the tongue make the mouth very sore, which prevents the bird from feeding freely.

It is common practice to tear off this scale, which drastic method is quite as painful as the trouble which it is supposed to relieve. The more humane, yet quite as effective method is to administer a dose of epsom salts and gently anoint the tongue with a little glycerine a few times, after which the scale will either come off itself or can be removed without undue suffering on the part of the patient.

Pneumonia is much more frequent occurance in poultry in Canada than is commonly supposed, especially where fowls are provided with no shelter and are exposed to all weathers and sudden changes; we have also seen several instances of this amongst the valuable show birds which have evidently contracted it through exposure on their journey to or from poultry shows. It is also undoubtedly due to certain instances to the inhalation of irritant matter, and we have known several birds dying of this complaint after a particularly strong and continued dust storm, whilst in other instances we have known of several deaths caused by poultry-keepers sprinkling the floors of the fowl-houses in a liberal manner with unslaked lime.

The symptoms consist of rapid breathing, thirst, ruffled plumage, and the birds will either stand with drooping head and wings or squat in a huddled manner.

The disease is so rapid and so frequently fatal that treatment is hardly worth attempting. The bird may be shut up in a warm place, the back above the lungs painted with tincture of iodine or turpentine, and a few drops of spirits of camphor and brandy in milk given at frequent intervals.

The diet must consist of soft food which should be of a nourishing nature; a little chopped liver daily will be of great help.

Scaly Leg is extremly common in Canada, and there are few yards where some indication of this cannot be observed, especially where poultry are confined in bare runs; fowls which have access to grass are not so liable to this complaint for the moisture seems to check it. It is due to the presence of a small insect which penetrates underneath the scales of the legs, causing the unsightly roughness. If taken in time this is easily cured, for in its early stages there is not much difficulty in destroying the parasite.

The simplest remedy is to scrub the legs of the fowl with soft soap and water, dry well, then rub them over with a rag which has been soaked in paraffin oil. It is necessary to repeat the treatment at regular intervals, about twice weekly is sufficient, until a cure has been effected.

WHITE COMB.—The cases of this usually met with are generally due to a parasite, though the term is occasionally applied to a bird which has lost the healthy color of its comb

A Dirty Carpet
Or a Clean Painted Floor!
WHICH IS BETTER?
You KNOW which YOU would sooner have. You know which LOOKS the best and is the easiest to KEEP clean. Better decide now to freshen things up right away with a tin or two of M-L Floor Paint.
M-L
You should use M-L Pure Paint to paint anything that needs painting. It protects the surface covered better and longer than most other paints. You buy it in tins—all ready to apply. Made of guaranteed pure materials, mixed with twenty years' knowledge of paint-making for practical painters.
Think what a difference a few dimes' worth of M-L Pure Paint would make about the house. It would make some of the wood-work look like new—or a worn-bare, shabby-looking floor made spic and span as when you first walked on it with M-L Floor Paint.
PURE PAINTS
Paint the WALLS and CEILINGS with M-L Flat Wall Colors. You'll find it far easier to keep them clean and sanitary as well as brighter looking. Easiest to apply. The colors are clearer and brighter; keeps its FRESH LOOK longest. Artistic, sanitary, durable, washable and VERY economical.

Fletcher Bradley's Poultry Supply House. 104 Waverly St., Ottawa, Ont

and face, either through improper treatment or feeding, or through close confinement in dark quarters, in such cases the remedy is obvious, change the conditions and treat the patient as in the case of anaemia.

When, however, the trouble is due to parasitic causes, no time must be lost, for it spreads very rapidly and only yields to drastic treatment.

The first indiration of this disease is usually observed by the appearance of a small patch of white on the comb of the bird. If this is examined closely it will be seen that it consists of a number of white spots about the size of a pin's head. If neglected, it spreads rapidly all over the comb, face, wattles, and frequently on to the neck, and if a bird affected with this disease is not immediately isolated it will spread contagion through the entire pen.

We have succeeded in curing this disease by regular applications of cyllin, which should be applied after the comb has been washed well and dried.

Another effective cure is to rub the comb with paraffin oil and then apply carbolic ointment.

Worms are a frequent source of trouble to poultry-keepers in Canada. The birds become weak and listless, walk with an appearance of stiffness, and lose condition generally. The best measures to adopt are to remove them into a small run, carefully clean up and burn all excrements every few hours, whilst a dose of 10 grains of ground areca nut given in milk while the bird is fasting will generally effect a clearance. A second dose may be given two days later, but in the interval care must be taken to see that all droppings are cleared up

Ground which has been carrying fowls with worms should be well limed and not again used for poultry for several months.

When it is noticed that a bird is out of sorts, do not leave it to recover of its own accord or die, but pick it up and keep it under observation until the trouble has been determined or a recovery affected.

If fresh poultry are bought, do not immediately place them with the other birds unless the yards from which they have been procured are above suspicion; if they have been purchased on the market do not place them in the runs with the other stock under any circumstances, but keep them isolated and under observation for at least two weeks.

Do not buy food for poultry because it is cheap, cheap samples of poor quality are generally the most expensive in the long run. A little good food is infinitely better than a lot of bad.

Do not neglect the fowl houses; a thorough spraying with a strong disinfectant once every month or so, especially during the spring and summer months, will save a great deal of trouble and probably many lives.

See that no decaying vegetable matter is left in the runs.

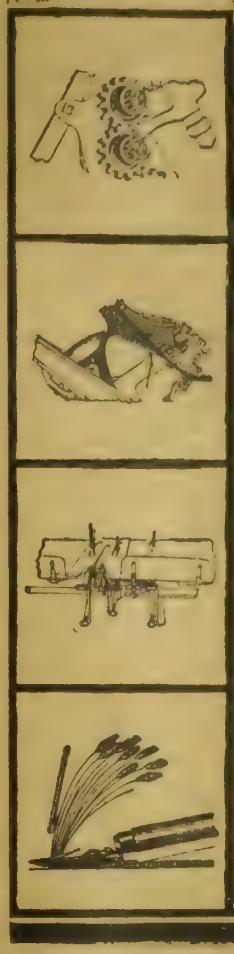
Do not allow the drinking water to be exposed to the sun; fowls enjoy a cool drink as much as do human beings, and sun-heated water and dirty drinking vessels are always a source of danger.

Do not overcrowd poultry either in houses or in runs; remember that small flocks give better results in proportion than if large numbers are kept together; overcrowding is another way of spelling trouble.

Use every endeavor to keep poultry on the move, give plenty of scratching material, such as stable manure, dry leaves, chaff, etc., and bury the grain in this; plenty of exercise tends to keep us all in good condition.

Remember that poultry require green food, also that grit must always be before them. A good dust bath must also be always available, or lice will become a source of constant irritation to the birds, which cannot be expected to thrive under such conditions.

Look at regular intervals for foul ticks in the cracks and crevices of the fowl-house, especially during the spring and summer months.



Buy a Deering Binder and Avoid Waste

THE Deering binder has proved itself master of the grain field. The Deering knotter, its three-loop the mechanical wonder of the age, still twists the twine into that ingenious knot which the human hand has never been able to equal. Deering harvesting and haying machines have established a world-wide standard. The sun never sets on the Deering binder, and every day of the year and every hour of the day its click can be heard in some harvest field.

Deering quality has a name the world over; it never varies, but the machine itself is changed to suit the demands of different countries. The Deering New Ideal binder is made especially to do the work of Ontario and Eastern Canadian farmers. It is manufactured at Hamilton, Ontario, within easy reach of all. Using a Deering binder means easy pulling for your horses, quick, light work on hilly fields, and good work even on rough ground. Your harvest troubles cease when you use a Deering binder. See the Deering local agent, and have him show you the good points of the harvesting and haying tools and binder twine. Get catalogues from him, or, write the nearest branch house.

Putting Away Your Next Winter Eggs.

When eggs are most plentiful and cheapest, either to sell or to buy, is the time to put them away to use when they are scarce and dear.

I have put them in the water glass solution just after Easter, and found them fresh and good the following Easter—the white being quite firm and whipping well. The waterglass is a liquid much resembling honey in appearance It can be bought in tins at drug or grocery stores, or if you are near a soap factory you will get it cheaper there. Use one part waterglass to seven or eight parts water. Have the mixture in a crock, and put the fresh eggs into it as you get them. Keep a plate on top to hold the eggs under the liquid.

Eggs are now so dear in winter that it is economy on the part of the housewife to put by ten or twenty dozens when eggs are plentiful.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to make the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation" you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 WINDSOR, Ont.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Dreaming of Home.

It comes to me often in silence,
When the firelight splutters low—
When the black uncertain shadows
Seem wraiths of long ago;
Always with a throb of heartache
That thrills each pulsive vein,
Comes the old unquiet longing
For the peace of home again.

I'm sick of the roar of the cities,
And of the faces cold and strange;
I know where there's warmth and welcome,
And my yearning fancies range,
Back to the dear old homestead,
With an aching sense of pain;
But there'll be joy in the coming,
When I go home again.

When I go home again! There's music
That may never die away,
And it seems the hands of angels
On a mystic harp at play
Have touched with yearning sadness
On a beautiful broken strain,
To which my fond heart wording—
When I go home again.

Outside of my darkened window
Is the great world's crash and din,
And slowly the autumn shadows
Come drifting, drifting in.
Sobbing, the night wind murmurs
To the splash of the autumn rain;
But I dream of the glorious greeting
When I go home again.

Love's Barrier.

(Concluded.)

CHAPTER xxv

THE UPWARD WAY

An English lady in a quiet brown travelling suit, and carrying a small valise, got off the boat at Chareaton at sunset on an autumn evening. The air was mellow, yet cool; and the fading leaves were swirling gently in the pensive wind. A few work-men returning from their occupation further up the river were the only other passengers, and they regarded her curiously as she stepped off at the little landing stage. One brown-faced, elderly man in a blue smock made pause a moment, and asked whether he could carry her valise. Helen thanked him in excellent French, and indicated her destination, the Convent of the Sacre Coeur. Instantly a look of sadness overspread the face of the work-man, and he shook his head.

"Ah, madame, it is impossible! It is no more!"

"No more!" cried Helen, her tone shrill with apprehension. "Do you mean that it is knocked down? Why, that is its bell ringing now for vespers. I remember it well."

"The bell may ring, madame, though always to us now it sounds like an knell," he made answer. "The cruel fate has overtaken the Sacre Coeur, the fate that threatens all France. The sisters have been turned out, and some say they have gone to England. Mon Dieu! that He should permit such things to happen and send no fire from Heaven! They who do not believe say He sleeps and laughs with scorn. But for the poor it is a serious thing. Here in Charenton they were our only friends."

Helen looked inexpressibly shocked, and at the same time perplexed. She had made so certain of this refuge that she had made no plans beyond it. And now it was the late evening, and Paris some distance away.

"Madame was for the Sacre Coeur, then?" said the old man inquiringly, with sympathy written on his face.

"Yes; I was educated there, and I thought to see them all again. I know not what to do now. Perhaps I ought to take the boat back again, but it has just gone."

"Only for fifteen minutes, madame; there will be another one. But what will you? There is no hotel good enough perhaps in Chatenton. We are only simple people, and the great do not visit us."

Helen smiled once more at the quaint and humble speech, inseperable from types of his class, but stood still undecided.

"Madame is undecided; but there is one of her own people still in the white house on the hill. The old English clergyman who used to live at Marny. You remember him, perhaps? He was greatly beloved."

"Why, yes, of course; I attended his church. Can it be possible that he is alive still? Why, he was an old man then; he must be very, very old now?"

"He is hale yet, and full of service for the poor. His heart ached with us when the sisters were driven forth, and in some measure he takes their place. He fills his days with good deeds for the poor; and though he is not of our faith, what matters it? What are we but children of the bon Dieu, every one of us, whatever name 'l ourselves by."

Helen looked no longer undecided. "The white house on the hill! I will go there. Is it far?"

Jaques set down the valise, and pointed with his brown and withered forefinger up the slope to a white house with green shutters set in a pleasant orchard on the ascending slope.

"I can walk that distance if you can help me with my bag. I will give you two francs."

Jaques's answer was to shoulder the valise and turn his face manfully towards the house on the hill.

"But first take me round by the Sacre Coeur. I know thw way. It will not add more than five hundred yards to our walk."

Jaques cheerfully acquiesced, and they truged by the river bank a few yards until the whole edifice of the convent, with its high protecting wall, its iron gates with the branching chestnut flanking its pillars, came into view. Arrived before the gates, the old man set down the valise and took off his cap. Helen stepped forward and looked through the bars up the long, straight line of the chestnut avenue, which terminated in the open space before the cloisters. A deep and melancholy silence brooded over the deserted place; the grass was grown between the round cobbles and the flags of the courtyard; the windows were darkened; the doors, that had ever been open wide to succour the poor and needy, were bolted and barred. The whole place murmured of death and decay. Helen's eyes filled with tears. She had yearned for the peace of the place, for its old memories, its aloofness from the sin and sorrow of the world. And lo! it seemed to her overcharged heart that the last prop was taken away, and she was left desolate and stranded in a wintry world.

Jaques loved her for those tears; and when she wiped them away, and began to walk again, he trotted contentedly by her side, telling of the evil times just before the sisters were swept out, and of how their ministry was missed in the place.

"Look you, madame; there is no sense nor justice in it. It is true that some were bad, very bad, and that the scandals called for loud redress; but here it was different. Le bon Dieu Himself could not have done more for His children than our little sisters."

Helen sighed as she aquiesced. She had followed with interest the cleansing of the religious houses of France, but had never dreamed that the only example she knew would be called to suffer the common fate. Charenton had always seemed immune, remote from the world.

They did not talk further as they walked; and in a short time they had climbed the gentle ascent and arrived at the white and green gate of the parsonage house.

"Monsieur is at home, I know," observed Jaques cheerfully. "But perhaps madame would like me to wait till she makes certain."

"Yes, wait, in case I wish to go back to the boat."

Jaques stood still in the narrow path, keeping guard on the valise, while Helen walked up without shrinking to the door. Her knock was answered by a middle-aged servant wearing a blue linen frock and a white mob cap, who, in answer to her inquiry for Mr. Bethell, bade her enter, and at once showed her into a little salon, where the old pastor was reading the evening paper. Helen remembered his tall, spare figure, his thin, fine, intellectual face, and found him little changed, except that increasing age had created a more spirituelle look. His smile was benign as he rose to greet her.

"You do not remember me, Mr. Bethell," she said a little eagerly. "I was a pupil about twelve years ago at the Convent of the Sacre Coeur. I came here to-night thinking to pay them a surprise visit, and remain quiet for a little. I find nothing. A workman who carried my valise told me you were still here, and I thought I should like to see you."

"Surely," said the old man, with his ready and beneficient smile, "you are very welcome; and if you can stay with us for a little my daughter, no less than I will be pleased. We do not often have a visitor from the outside world." He searched her face as he shook hands with her, but failed to recall her by name.

"There is something familiar, but there were so many in the years we were at Marny."

"Yes, yes; I quite understand. My name was Revell—Helen Revell. I came from India; perhaps that will help you."

"Your father was a soldier—a distinguished soldier, I think, Am I right?"

"Quite right," said Helen hastily. "And if you are so kind as to permit it, I should very much like to remain all night, to hear further about the convent, and all that has happened in Charenton since I went away. I never had happier days than those I spent with the sisters at Sacre Coeur."

"They are sadly missed here, Hiss Revell, or perhaps I ought to say madame now?"

"I am married," answered Helen simply. "My name is Secretan."

"And where have you left the man with the valise?"

"He waits outside. May I ask him to bring it in? But you spoke of your daughter. Will it not be better to ask her first whether it is convenient to have an unexpected visitor invading your house at this hour?"

"Lucy has gone to Paris and will not return before nine. I shall be having my evening meal presently, and you will share it, which will be uncommonly pleasant for me. It is sure to be convenient. Lucy makes no trouble of anything. Let me send Babette for the bag."

"I must see the man myself to pay him and to thank him; he has been so kind coming out of his way with me," said Helen gratefully, and left the house to relieve Jaques, feeling a wonderful sense of relief and peace. Within half an hour she had made herself at home in the parsonage house, and the feeling of blank disappoinement she had experienced before the closed gates of the convent had passed away.

When Lucy Bethell, a handsome, middle-aged women, with a kind face returned, she was both surprised and pleased to find a guest in the house. She took it all as a matter of course, bade Mrs. Secretan welcome, and Helen fell asleep that night with the comforted feeling of one who, wandering in the wilderness, suddenly had come uoon a home.

She did not leave Charenton next day, nor the day after that; a week found her still an inmate of that peaceful home, endearing herself to the inmates, and giving them so much new interest in life that they would not listen to her talk of going. They easily surmised that she had some trouble at her heart. Beyond informing them regarding her husband's occupation and the situation of her home, she spoke very little, at least directly about herself. But during the long talks they had, both indoors and out, Mr. Bethell and his daughter arrived at the same conclusion—that their guest was wrestling with some problem, seeking the solution of the difficulty that had

SAVED FROM AN OPERATION

How Mrs. Reed of Peoria, Ill., Escaped The Surgeon's Knife.

Peoria, Ill.—"I wish to let every one know what Lydia E. Pinkham's Vegetable

Compound has done for me. For two years I suffered. The doctor said I had a tumor and the only remedy was the surgeon's knife. My mother bought me Lydia E. Pinkham's Vegetable Compound, and today I am a well and healthy woman. For months I suffered from inflammation, and your Sanative Wash relieved me. I am glad to tell anyone what your medicines have done for me. You can use my testimonial in any way you wish, and I will be glad to answer letters."—Mrs. CHRISTINA REED, 105 Mound St., Peoria, Ill.

Mrs. Lynch Also Avoided Operation.

Jessup, Pa.—"After the birth of my fourth child, I had severe organic inflammation. I would have such terrible pains that it did not seem as though I could stand it. This kept up for three long months, until two doctors decided that an operation was needed.

"Then one of my friends recommended Lydia E. Pinkham's Vegetable Compound and after taking it for two months I was a well woman."—Mrs. JOSEPH A. LYNCH, Jessup, Pa.

Women who suffer from female ills should try Lydia E. Pinkham's Vegetable Compound, one of the most successful remedies the world has ever known, before submitting to a surgical operation.

The right to wear a Clean Collar

Every man can have a clean collar if it's a Challenge Waterproof Collar. Best to wear at work or for dressing up after work. Not shiny, but look just like linen. Always neat and comfortable and are cleaned with soap and water.

brought such a pathetic look into her eyes.

It was no part of their creed (who had comforted so many) to seek to probe into the inner sanctuary of her heart; but the day came when she spoke out of her own accord. It was on one of the golden afternoons when they wandered in the apple orchard, where the fruit was ripening red and gold in the sun, that Helen unburdened her heart to the old man, who, though living out of the world, had never lost the understanding heart. He listeed with the greatest attention, never interrupting her once, while she tried to set before him in simple, clear language the story of her life, more especially the story of the past two years.

"I have arrived at a point where I need someone wise and good to tell me what to do," she said in conclusion. "Will you be that one? Perhaps God guided me to you. Certainly I felt that I must come to Charenton, though it was to the Mother Superior of the Sacre Coeur I expected to tell my story."

The old man hesitated a moment, looking with great compassion and kindliness into her beautiful face. He laid his hand gently on her arm, and drew her to a little arbour that had been set up in a sheltered corner of the orchard, and made a charming retreat alike for the summer sun and the autumn wind.

"Sit down here, my daughter, and let us look this thing squarely in the face," he said; and Helen, conscious of nothing but profound relief, waited without tremor haste for the verdict. It did not in the least surprise her when it came after a few moments, in accents quite clear and firm.

"The way of duty is clear, my daughter. You will have to go back. You will have to take up your life where you left it. There is no other way."

"But I am misjudged, mistrusted, kept on the outside," said Helen with difficulty. You can never have lived in such an atmosphere, and you do not know what a soul destroying thing it is."

"I think I can understand. But it is just here where you must show yourself a strong and a true women. You must rise above suspicion, distrust, coldness, and by love conquer them all."

"But there is no love to help me," said Helen in the same difficult voice, for it was a hard thing for her to lay bare her soul, and only dire need could have made it possible. "A heart constantly thrown back upon itself becomes slowly, but quite surely, hardened. I can live away from my home in peace, but I can not live in it under the conditions that exist as I have tried to describe them to you."

"It seems to me," said the old man slowly, "that the whole situation is based on a false conception of your duties to one another. As you have confided in me, we will confine ourselves, in the first iustance, in that particular duty. Shall I tell you how it appears to me?"

"Yes, surely. It is what I wish to hear."

"Then, undoubtedly, you have failed in not laying bare your whole heart to your husband. He was entitled to it. A priest is only a man, and his failings are very human. You might, I think, have trusted to his judgement, his Christian tolerance. You did not give them a fair chance."

"He did not give me a chance," she retorted quickly. "He condemmed me unheard on the evidence of an anonymous letter. Could anything be more degrading to a women?"

"He suffered, too, my dear. I do not seek to defend him, only I see in him the conduct of a man who was distraught, and who did not know where to turn. Can you not give him the benefit of the doubt, and grasp the fact that his very hardness arose out of the depth of his love for you, his fear to loose you?"

"It seems to me," observed Helen in a low, tired voice, "that there is something in the marriage bond which makes things harder than they are elsewhere. Even when there is love, it is always a jealous love."

"Then it is of the earth, earthy, and has never been purged by the divine fire," returned the old man without a moments hesitation. "I have seen and known much of the sorrow of life, but I have never known love—the true love, which has very little of self in it—to fail. It conquers all."

"Mine will never reach such a height, then," said Helen hopelessly, "because I want personal happiness for myself."

"Tell me, why did you make this marriage, which you have admitted was not, on your side, wholly disinterested at the beginning?"

"I thought I had made that clear—I married to escape an intorable situation."

I H C Engines Furnish Ample Power at Lowest Cost

AN engine that develops more than its rated horse power, with the lowest possible expense for fuel, needs only one other feature to make it the best engine a man can buy. That feature is durability. The engine which combines these three qualities, ample power; low fuel cost, and durability, is an

I H C Gasoline Engine

In an emergency, an I H C engine will develop from 15 to 30 per cent more power than it is sold for. Because of its scientifically correct mixer, it uses less gasoline to develop that power than is required by any engine not so equipped. It is durable because only the best material is used, put together with the precision of a high-priced watch. For work on farm or estate, in mill, shop, or factory, wherever reliable, dependable power is required, an I H C engine is the one best buy.

I H C engines are made in every style—horizontal and vertical, air and water-cooled, stationary, portable, and mounted on skids, to operate on gasoline, kerosene, distillate, or alcohol; sizes 1 to 50-horse power; kerosene-gasoline tractors, 12 to 45-horse power. Sawing, spraying, pumping, grinding outfits, etc.

The I H C local agent will show you the good points of the I H C engine. He will explain why an I H C engine is durable. He will show you how simple it is. He can give you good common-sense reasons for buying an I H C engine in preference to any other. Get catalogue from him, or, write the nearest branch house.

WAS TROUBLED WITH HIS HEART

HAD TO GIVE UP WORK

Mr. Alfred Male, Eloida, Ont., writes: "I was troubled with my heart for two or three years. I thought sometimes that I would die. I went to the doctor, and he said he could not do anything for me. I had to give up work. My wife persuaded me to try Milburn's Heart and Nerve Pills. The first box relieved me, so I kept on until I had taken seven boxes, and they cured me. I would not be without them on any account, as they are worth their weight in gold. I advise my friends and neighbors who are troubled with heart or nerve trouble to try them."

To any of those suffering from heart or nerve trouble we can recommend our Milburn's Heart and Nerve Pills with the greatest confidence.

Price 50 cents per box, or 3 boxes for $1.25. If your dealer does not have them in stock, send direct to The T. Milburn Co., Limited, Toronto, Ont.

THIS handy farm wagon is built low (which saves time and labor loading and unloading) and will carry the heaviest load—anywhere a horse can travel. And because it never needs repairing, it's the most economical wagon on the market.

T-A Handy Farm Wagons and Wide-Tire Steel Wheels

Equip your old wagons with T-A Wide-Tire Steel Wheels and they'll be just as good as new. And besides they'll carry 25 to 50 per cent. heavier loads. For catalogue and descriptive literature write to.

MAXWELL

THE HIGH SPEED CHAMPION WASHER

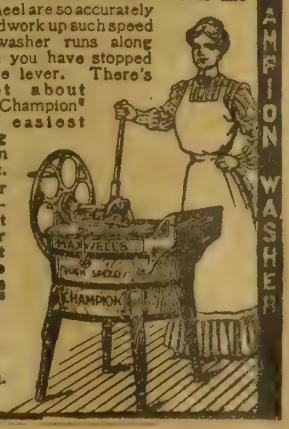
MAXWELL'S HIGH SPEED CHAMPION

is the Washer for a Woman

In the first place, Maxwell's "Champion" is the only washer that can be worked with a crank handle at the side as well as with the top lever. Just suit your own convenience.

Another Maxwell feature—Lever and Balance Wheel are so accurately adjusted and work up such speed that the washer runs along even when you have stopped working the lever. There's no doubt about Maxwell's "Champion" being the easiest running washer on the market.

Write for new illustrated booklet if your dealer does not handle Maxwell's "Champion" Washer.



DAVID MAXWELL & SONS, St. Mary, Ont.

92

"And now you would leave it to escape another intorable situation," he said, with a gentle irony which slightly deepened her colour.

"Then your sympathy is not with me?" she said a little hurredly, as one who has been wounded by a word.

"My sympathy is entirely with you. But I would be just, my dear, and prevent, if I could, this shipwreck which is threatening your life."

"It is not only threatening it; it has overtaken it," she said quickly. "I shall never go back."

The old man streched out his thin hand, and laid it with a firm insistence on hers.

"Never" is a long word, my child, and should not be spoken in haste. As you say, the desire for personal happiness is insistent, and while it is not in itself a wrong desire, it should not be the first. The whole lesson of life, as I understand it, is this—that we are put here, not so much to obtain happiness for ourselves, as to create it for others. Your heart, no less than your conscience, will tell you how far short you have fallen of this ideal."

"I did my best," she answered simply and humbly. "And I thought some of the people loved me."

The humility and pathos with which these words were spoken touched the old man inexpressibly.

"It is because you have this power to win others that your responsibility is the greater. You can influence many, and you must be above reproach yourself. More is required from those to whom the gifts have been given."

More sacrifices, do you mean? Then I am to cease caring about my own happiness?"

"You grasp my meaning, though you take out of it more than I wish. My daughter, you will learn, as you grow older, that in the pathway of duty, even while the skies are grey and weeping, the only true happiness is to be found. All else is confusion; God has so ordained it."

"So my duty is to go back?" she said dully, for it was born in upon her that there was no escape.

"Undoubtedly. What you did was a noble thing; you saved a sweet and pure young life from degradation without counting the cost to yourself. That will not be forgotten, nor yet go unrewarded.

But the action was incomplete. You must make full confession to your husband, and then abide by his decision."

"He is a hard man, and though I go back I might have to leave my home again, and in more painful circumstances. When must I go?"

"There is no haste," he answered affectionately. "It is a great joy to Lucy and to me to have you here. Stay and rest. Your husband is away; and even if he were not, it will be good for him to feel your absence a little keenly. Stay and rest until God shows you the way."

With this suggestion Helen was happier having relieved her mind, and made her whole position clear to her kind entertainers. A few more days slipped away in quiet Charenton, and Helen felt herself gaining in bodily strength as well as in peace of mind. On the fourth day she wrote to Jane, and likewise to Cynthia at Colchester. And still she waited, with a curious certainty that a day would dawn when she should be left in no doubt as to the way in which she should walk.

She was lying down one afternoon in the little guest chamber, which looked out upon the laden orchard, not asleep, but going back, as she so often did, on every detail of the past, when Babette knocked lightly at the door.

"If you are not asleep, madame, will you come to the salon to Mademoiselle Lucy? She has need of you."

Helen sprang up ready and willing.

"In a minute, Babette. Tell mademoiselle I shall be down immediately."

She plunged her face into the cool water, hastily brushed her hair, and slipped down the polished stairs. The house was very still. She imagined she heard the sound of voices proceeding from the salon; but when she opened the door there did not seem to be anyone there. The long win-

MONTREAL. WINNIPEG. CALGARY. VANCOUVER. 87

dow of the room opened upon a small terrace, and as she stepped towards it someone came from the outside—a tall figure, in a very English overcoat, his face turned eagerly towards the door. The next moment she felt herself wrapped warm and close in his arms, and heard his voice, broken by the deepest feeling that can stir a man's heart, murmuring words of endearment and imploring her forgiveness.

"My wife, my own darling, my Helen, can you ever forgive me? I have been hard, unjust, cruel; but I did not know I made the place so bitter for you that you could not bear it. My poor wife, forgive me and come home."

She suffered herself to rest quietly for a moment, conscious of nothing but an overwhelming sweetness and joy. She had no questions to ask; it was enough that by some strange means the curtain of shadows had been rolled back, and the sun was out upon her life once more. It could not be her letter to Jane or to Cynthia, because they could not yet have received them. After all, what mattered the means so the end was here? For her heart told her this was love, the love which can so illumine the pathway of life that it becomes a heavenly place.

"When I got home and found that you had left me I was a man distracted. Yes, it was a week earlier than I expected. My conscience would not let me rest. I came to myself. Why did you leave Midcar? I want to know the worst, to see myself with your eyes."

"I had to get some light on my life. I needed peace, and I did not know where to turn. But if you had stayed away the full time you would have found me at home before you; I was going back to-morrow."

"I am in time to take you then. Thank God!"

"But, Claude, I have been wrong too. You will hear my story first?"

"I will hear from you only one thing, Helen, and that is that you forgive and love me still. I know enough. I went to Geoffrey Hayes in my misery, and he told me everything. He said you would absolve him from silence because of the issue at stake. You are enshrined in that good man's heart as a saint might be. It is only I who have been blind."

Her hand on his lips sought to silence him.

"Tell me how you knew I was here she asked at last.

"I wired to Cynthia, and she answered bidding me try Charenton. But before I started I received Mr. Bethell's letter, and here I am."

"So he wrote!" said Helen with a little smile, and at that moment the door was softly opened, and the kind old face with its halo of white hair peered in. They made haste to draw him into the room to thank him for what he had done and to assure him that all was well.

So they were called back to earth which promised them some of that happiness which gives a foretaste of heaven.

* * * *

Some years have passed away since these poignant weeks in the experience of Claude Secretan and his wife. They have left Midcar, and are to be found in a large and important parish in a great city. Secretan has made his mark, and those who know predict a bishopric for him, while he is yet in his prime. He is ably assisted in his many labors by his wife, and their home life is happier than most. Bound together by their common love for the Lord Jesus, their lives are concentrated in the best and widest sense. They have never been forgotten in the moorland parish where their married life began, and, with their children, pay frequent visits to Jane, the beloved Lady Brede of Mardocks, and sometimes to Audrey, now the happy wife of John Ridd. Nor is Colchester quite forgotten. They have drawn Cynthia into the orb of their gracious influence, and she has learned from her stepdaughter that it is impossible to be supremly happy without much that the world counts as riches.

One other place Secretan and his wife often revisit, and always quite alone—the white house with the green shutters on the hill behind Charenton where the apple orchards look down upon the flowing Seine. For that old house witnessed the reunion which was their real marriage, and with which the actual journey of life began.

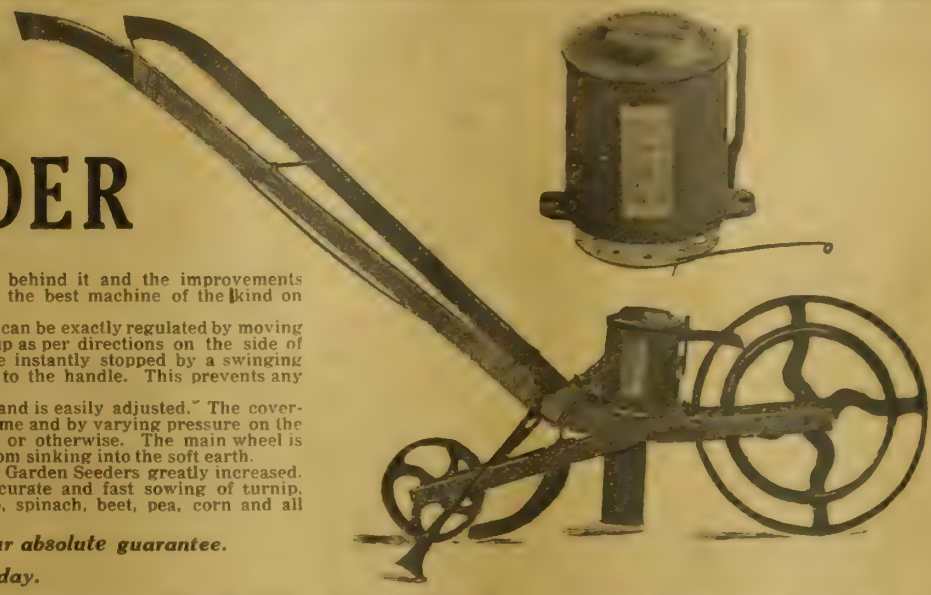
Saves You Time and Money



Our Seeder has years of success behind it and the improvements recently added, makes it without doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. The flow of seed can be instantly stopped by a swinging cut-off operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim which keeps it from sinking into the soft earth.

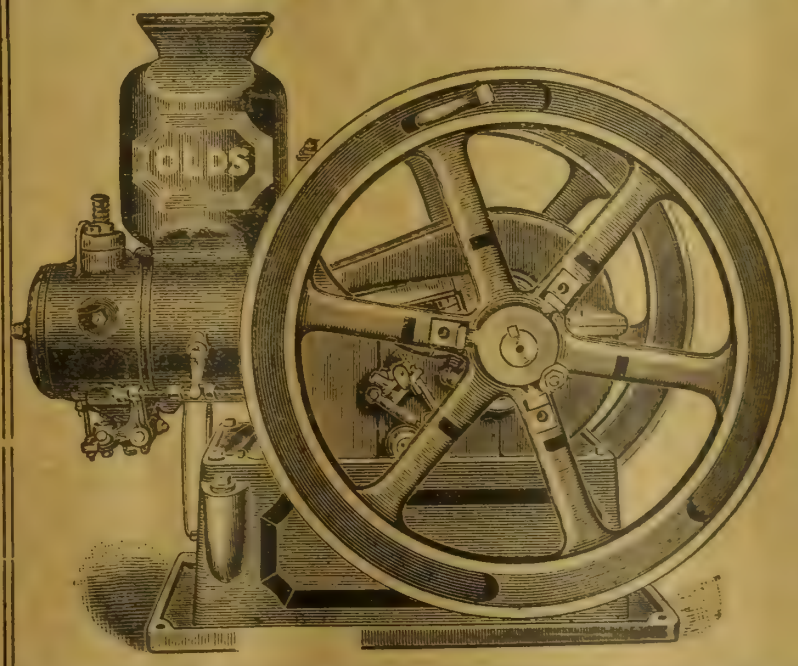
Each year finds the demand for our Garden Seeders greatly increased. No better seeder can be built for accurate and fast sowing of turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seed.

Every machine carries our absolute guarantee.

Send us your orders today.

The Sussex Manufacturing Co. Limited, Sussex, N. B.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole Sale Representatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

FLORICULTURE.

A number of Maritime Farmer subscribers wish to know how to make Geraniums bloom. One has has tube roses that grow well but do not bloom.

Turn geranium out of the pot and examine the ball of roots. If it is in good condition the probable cause of failure to bloom results either from too large a pot, too much root room and over watering or else keeping the plant in a shady situation, any one of these conditions being more favorable for production of foliage than bloom. For production of bloom keep your plants moderately pot-bound watering only when needed which is whenever the top soil shows slightly dry, then water well. Give them all the sun you can, and, if strongly pot-bound, occasionally a dose of weak manure water. Treated in this manner Geraniums should give an abundance of bloom.

The reason why your tube roses do not bloom is that the centre of the bulb cobtaining the germ of the flower stalk has rotted. This is a not uncommon occurence if the crop of tube rose bulbs was not properly cured, when taken from the ground and dried out, a large percentage of the bulbs will lose the flower germ. Such bulbs will throw up foliage and make offshoots or young bulbs but will never bloom. The young bulbs, if planted in a rich soil for two years will become blooming bulbs but such cheap bulbs do not pay to take that trouble. Throw your old bulbs away and try new ones.

A few readers have sent away for roses of different varieties and I have received inquiries from readers of the St. John Globe as well as from readers of the Maritime Farmer asking if hardy roses can be procured in the Maritime Provinces and, if so, whether they would not be better than imported stock.

It has always been a subject of wonder to me why so many people will send so far for roses which, in most cases, are grown in a very warm climate, and nearly always budded stock, when good healthy plants, grown on their own roots, in Maritime soil can be obtained from our own florists. Many of the readers who have had experience with imported stock will hear me out in this.

I. H. writes:—What shall I do with my hardy roses and some of my shrubs that have long black stalks.

All hardy roses and shrubs should be pruned as soon as they are sufficiently leaved out. This season has been so backward that it was hard to decide very early as to which branches were alive and which wece dead. Destroy all sprouts off the roots and stems below the bud of all budded roses as they are worthless and, if they are allowed to grow they lower the vitality of the crown.

R. O. C., St. John, writes.—Last fall I planted tulips. The bed is about twelve feet long and the bulbs are blooming nicely at each end but the sides are failures. On examination I find that part of the bulbs are rotten. How would you account for this condition and how can I guard against it for next season.

Your bulbs were probably destroyed by poor drainage at the low parts of the bed. Tulips receive well drained soil and if planted in low, wet spots they nearly always fail. Next fall raise the bed to overcome this difficulty.

H. A., writes:—Tell me what to plant in my garden at my country home?

Some hardy plants of the old fashion sorts that are so pretty, bloom so freely and require so little care and come up year after year, each season better than the last would be all right for your country garden. The Larkspur ranging in colors from white through shades of blue to deep maroon should be planted in clumps so that they can be staked; their foliage is pretty after the bloom has gone. Lupines, Gallardias, For-get-me-nots, Sweet Rockets all blooming in succession produce a pleasure denied to the growers of annuals alone, pleasing as they are. In a bed next to a house wall or fence that has sunshine a part of the day, plant Hollyhocks next to the wall then a row of Larkspur and then a row of Gallardias in front leaving room for a border of Primroses, Forget-me-nots and Daisies. A few annuals may be planted between the groups so that one can have bloom from spring till fall.

The Production of Mutton as Influenced by the Application ot Manures to Pasture.

Following is a report of experiments carried on during fourteen years simultaneously in several districts in Gteat Britain with a view of ascertaining the results of manuring permanent pastures.

The trial fields were pastured with sheep the results being obtained in terms of live weight increase. Following is a summary of the conclusions reached:—

1. Cake of various sorts was fed to sheep on pasture on 11 centres, and in no instance was the outlay on the cake recovered in the increased mutton produced by the sheep in the season when the cake was consumed.

2. In the latter part of the grazing season sheep getting liberal allowances of cake did not increase in weight to a greater extent than those getting no cake, but which were grazing pasture that had been improved by liberal dressings of basic slag.

3. The residual values of cake were occasionally higher than is usually eseimated, but, in comparison with basic slag, cake-residues had a poor ameliorative effect on the pasture.

4. Even when both direct and indirect effects of cake are taken into account, the original outlay was not recovered at two of the three main stations. This result was confirmed at such of the minor stations as were concerned with this problem.

5. It would appear to be bad practice to feed cake on pasture containing much clover, as the nitrogen in the cake residues has a tendency to repress the clovers by stimulating the non-leguminous plants.

6. Common burned lime, used alone at the rate of four tons per acre, has proved very ineffective; but smaller dressings of ground lime, when added to a phosphatic dressing, have sometimes been justified.

7. Basic slag applied as a single dressing at the rate of half a ton per acre, has generally proved a most effective agent in improving the feeding value of pasture, and its effects are not nearly exhausted at the end of nine years.

8. It has proved much more profitable to apply a heavy dose of basic slag as a single dressing, than to divide it into two equal portions and apply these with a three years interval.

9. A repeated dressing of basic slag has, however, had a marked effect in some cases, and the productiveness of slag pastures that are showing signs of exhaustion can be rapidly improved in this way. This action of a repeated dressing appears to be more rapid in many cases than the action of the first dose.

10. Basic slag put on in the middle of June had much more effect than the same quantity applied in winter.

11. Where a direct comparison has been made between the effects of equal quantities of phosphoric acid derived from basic slag and superphosphate respectively, the former manure has always produced the greater amount of live-weight increase; When the

Any Man May Easily Regain LOST VITALITY

Strong vigorous vitality, the crowning glory of mature, healthy manhood.
Do you know, reader, what this means to you?
If by these few simple inspired words (which every man may with profit read)

I should be the means of pointing out to you or other men the straight and sure, if narrow road to new manhood, new powers, new capacities for a better and more glorious physical and vital development, then in doing this I have rendered a great and lasting service to my fellow beings, and one which is infinite in its power for good

This self-same VITALITY, this builder of manhood and manly vigor, may easily be regained, and I will tell you how.

Have you ever stopped to consider that it is this VITAL FORCE which makes rugged men the real men that they are? It is this same MAN FORCE which is behind every great achievement in the world to-day, which gives the flower of our army and navy the courage to meet and face death unflinchingly, which gives the rough and rugged man of the plains that compelling power to rescue at all odds a loved one from some great peril, as our illustration here portrays, and it is this self-same, identical VITAL VIGOR which I must impart to you, reader, if you are not the man you should be.

Therefore, if I give you new vitality, I make you young again, and keep you feeling young the balance of your days. By increasing your vital supply, I soon have you answering "Simply feeling fine" to your friends' morning greetings, while they in their turn will secretly marvel at the wonderous change for the better which has come over you. A thoroughly vital, manly man is the greatest inspiration in the world; his power and fascination are felt by all women and all men alike who are near him. Nothing but death can conquer the giant of strength and manly vigor. On the other hand, how different with the half-man, the neurasthenic degenerate, who is burning up his vitality in dissipation and excesses! Is there any sight more pitiable, more repellent to one's sense of decency, then the weakling who deliberately kills his manhood and self-respect by acts of willful debauchery? Such a man has neither my sympathy nor can he proft by what of wisdom I can impart. But any man who is willing to make a fair, square fight for the return of his lost vitality and lost manhood, who will promise faithfully and honestly to discontinue any debasing practices or excesses he may be indulging, who will help me thus by helping himself to such, no matter how despondent he may be, no matter how weak and debilitated, no matter what years of folly have passed, to such a man I can offer all the encouragement in the world. Just lead a decent man's life, my friend, and then increase your VITALITY. All else will come.

I make and distribute a vitalizing appliance which I call a HEALTH BELT. I do not want you to get one of there HEALTH BELTS now nor to-morrow nor next week, for that matter, but first wish you to write for or call and get one of my little free books. I want you to thus have my whole story of this subject of VITALITY, so that you may judge for yourself. My HEALTH BELT, with suspensory attachment, is a complete treatment in itself; that is you place it comfortably around your waist nights when you go to bed and wear it at the time when you are asleep. The vitality which it produces and sends into your system hour after hour is felt as it flows in. There is no shock, but merely a pleasant, warm, soothing sensation which induces a sound, refreshing sleep. Weak back often disappears at once, and a better feeling is immediately experienced. Two or three months' wear is usually sufficient. The cost is nominal. With special attachments, my HEALTH BELT is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain, sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing or strong. Write or call to-day. Hours 9 to 6.

cost of manure is taken into account the profits from the use of basic slag have always been much greater than thase from superphosphate.

12. Potash added to a phosphatic dressing generally resulted in the production of more live-weight increase, but this increase was not a profitable one.

13. The addition of moderate dressings of sulphate of ammonia or nitrate of soda to land already treated with phosphate has increased the yield of herbage, but has, as a rule, reduced the yield of mutton. The use of nitrogenous manures on pasture would, therefore, appear to be bad practice.

14. Dissolved bones compare badly with basic slag and superphosphate, This is doubtless due to two reasons: (a) the slower action of part of their phosphate, and (b) the presence of nitrogen. But the nitrogen of dissolved bones, being less active than that of sulphate of ammonia, the general effect on the sheep of the dissolved bones has been better than that of a mixture of superphosphate and sulphate of ammonia. The use, however, of dissolved bones on pasture would seldom appear to be justified, and especially so as their phosphoric acid costs more than the same substance in basic slag.

Small Versus Large Seed Potatoes.

In 1908 a trial was made in the use of small and large seed. It was found for that year that when large tubers were planted (using about 35 bushels of seed per acre), the value per acre of the crop, less the cost of seed, was about twice as large as was the value of the crop when small tubers were used for seed were very large, many about 5 bushels per acre.

The same experiment was repeated in 1910. The Vermont Gold Coin was used in this trial. The large tubers used for s?ed were very large, many of the smaller ones being large enough for cooking. A third plot was planted as a check plot, using cut pieces for seed. The following table gives some of the results:

COMPARATIVE VALUE OF LARGE AND SMALL POTATOES FOR SEED

Size	Seed per acre. bu.	Yield per acre, bu.	P.C. value less.	market cost.
Small.....	13 0	88.9	92.3	$ 80.32
Large.....	76.5	162.3	92.4	130.30
Cut.....	9.4	115.7	96.0	109.36

The tubers were valued at thirty cents per bushel at planting time, and at one dollar per bushel at digging time. The spring price was the very highest obtainable, while in the fall potatoes were being retailed at $1.50 per bushel. For conditions of 1910 the very large amount of seed used is seen to be justified. No allowance is made for the increased cost of planting or for the increased cost of digging and marketing, but, making a generous allowance for these items, the heavy seeding would still show excellent profits.

It is well known that the increased showing of potato seed will increase the yield, but it is often a question to what extent the heavy seeding can be carried at a profit. In the spring of 1910 potatoes were a drug on the market. Many farmers could not sell what they had on hand. With such a condition it is always to sow an abundance of seed. The seed costs but a little, the heavy seeding will produce an increased yield, and as a general rule potatoes are a good price in years following low prices.

From the table it is seen that the check plot with cut seed produced a greater yield per acre than the small seed, although the amount of seed used in the check plot was the smallest of the three plots. The heavy seeding had the greatest number of stalks per hill, but we did not find an appreciable larger percentage of small potatoes on this plot. Particular attention was paid to this, and a study was made of the number of stalks North Dakota Agricultural College, and the number of small and large in 3rd annual report of Dickinson tubers for each hill.—C. R. Waldron, sub-station.

HORSES—Drafters, $150.00 to $225.00; Roadsters, $150.00 to $225.00; Carriage, $150.00 to $225.00

DAIRY PRODUCTS—Creamery Butter, Solids 28c. Prints 29c.; Dairy Butter, 23c. to 25c.

POULTRY AND DAIRY PRODUCTS—Eggs, 19c.; Fowl, $1.00 to $1.60 per pair.

FRUIT—Apples, about $100 per bushel.

MISCELLANEOUS—Hay, $12.50 to $13.50; Straw, $6.00 to $7.00; Wool, 25c.; Beef Hides, 10c.; Calf Skins, 12c. to 16c.; Sheep Skins, 80c. to $1.00; Lamb Skins, 15c. to 25c.

VEGETABLES—Potatoes, 50c. to 55c.

Since last report trade has been steady in all lines and prices low with few exceptions about as before. Potatoes have been offered fairly freely and shippers are not wanting to buy many more than orders call for, as the labor and loss incurred, should they be held on bond for any length of time, in sprouting has to be considered. The demand has been very fair but not as brisk during the past days as could be wished for with the result that prices are easier today. 55c. is the outside figure being paid by shoppers to farmers and lower prices may rule next week unless demand improves. There is quite a lot of hay offering but transportation is not available consequently it is moving very slowly. Oats are scarce and prices are above what shippers can afford to pay. Eggs are steady at 19c., supply being one thing short of last season. Dressed pork is about out of the market, the prices paid for the last offered was 10½c. for selects, including weight of organs. Butter is offering more freely and lower prices are expected. New cheese will soon be on the market, most of the factories being at work now.The weather conditions are just what is required for the growing crops and every thing looks good, the show for grass being the best for many years.

It is now well known that not more than one case of rheumatism in ten requires any internal treatment whatever. All that is needed is a free application of Chamberlain's Liniment and massaging the parts at each application. Try it and see how quickly it will relieve the pain and soreness. Sold by all dealers.

International Poultry Food

Prevents Cholera and Saves the Little Chicks

A little chick is just like a little baby—its health depends on its food. Improper feeding opens the way for disease. Chicken Cholera, Roup, Apoplexy, can be prevented and cured by feeding INTERNATIONAL POULTRY FOOD.

My chickens had Cholera until some of their combs were turning black. After using a few feeds of "International Poultry Food," I never lost another fowl, and Cholera has left my premises.—J. F. BARNETT.

Give all your chickens a daily feed of "International." It keeps them well—fattens up the broilers—makes hens lay all the year round—keeps the cocks vigorous—and insures raising the little chicks. If you want to make money out of your fowls, feed "International Poultry Food."

25c., 50c. and $1.00 a box. At dealers everywhere. Write for free copy of our $3,000.00 Stock Book, the greatest book ever written for farmers.

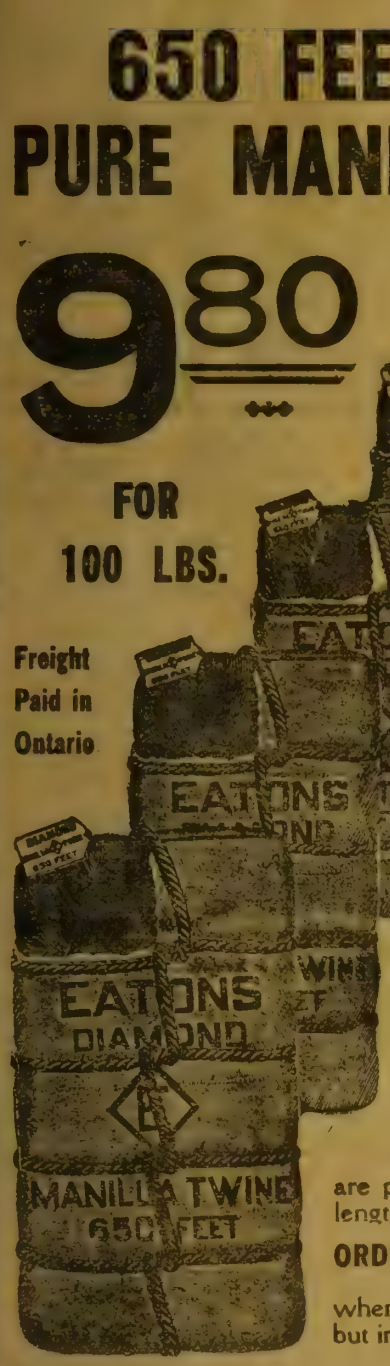
BINDER TWINE

650 FEET
PURE MANILLA

9.80

FOR 100 LBS.

Freight Paid in Ontario



NOTE OUR LOW PRICES ON

GUARANTEED BINDER TWINE

TELL your neighbors about our wonderfully low prices for Binder Twine this season. We will esteem the courtesy greatly if you will tell your friends who use binder twine, and tell them we will be glad to supply them with binder twine at the prices quoted in our Spring and Summer Catalogue.

WHAT WE SAY OF THIS TWINE

It is as good binder twine as is made, strong as any made, smooth and even as any made. We say this regardless of make, brand or price. Our 550 feet Diamond Brand Binder Twine is prepared with special care from the choicest manilla hemp and first quality long fibre sisal. Our Diamond 650 feet is made from pure manilla. Both are perfectly free from lumps, snarls, thin or uneven spots, and will measure full length to the pound. It is unusually strong, therefore every inch of it can be used.

ORDER EARLY Send in your order promptly—to-day if possible. If you do not want us to ship the twine at once, say so in your order. State when you will want it, and we will ship it so it will reach you on the day specified; but in all events we would suggest that you order before July 1st.

Minard's Liniment Co., Limited

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Ripening Cream.

How long should cream stand after skimming before it is churned? Is it a good policy to mix fresh cream with cream that has been standing two or three days before churning?

The answer to these questions depends necessarily upon the conditions under which one must work. To make the best butter with the smallest possible loss of butterfat in the buttermilk cream should be ripened before churning. If one day's skimming gives enough cream to make a churning the problem is easy. All that is necessary is to maintain the cream at a temperature which will bring about the proper degree of ripeness within a reasonable time usually by noon or afternoon of the day following during the summer season. If however, a skimming of several days is required to furnish enough cream to make a churning, then the cream first skimmed should be kept at as low a temperature as possible and ripening retarded until a sufficient amount for a churning has been collected. For example, suppose churning is done twice a week, on Wednesdays and Saturdays, Sunday's cream under these conditions, should be kept at as low a temperature as it is possible to keep it. When the cream is skimmed Monday this should be cooled down and then it can be mixed with the Sunday cream, stirring thoroughly but quietly. Keep down the temperature and repeat with Tuesday's cream. Then Tuesday afternoon raise the temperature sufficiently to bring about ripening some time Wednesday to complete the churning and working before dark. Just what this temperature should be depends altogether on conditions of temperature, etc. The essential thing is to hold down the temperature until the time to start the ripening process.

While the cream is being held it should be occasionally stirred gently with a paddle so that the richer part of the cream will not rise to the surface and form a leathery mass. During the ripening process it should be stirred in the same way every two or three hours. Never agitate cream with a dipper. Stir it gently and thus avoid the thick clots which make white specks in the butter. It is not a good plan to mix fresh cream with ripened just prior to churning for the reason that considerable of the butterfat will be lost in the buttermilk. Many are losing large quantities of the butter fat in the buttermilk without realizing it.—Wallace's Farmer.

To Develop a Persistant Milker.

Our endeavors to develop our dairy heifers into persistent milkers start when the heifer has its first calf, writes William Turner to Farm and Dairy, Peterboro, Ont. We take great care in milking the heifers using them as quietly as possible so as not to get them in the habit of kicking. Many a heifer is spoiled during its first year from lack of such care. If the heifer shows signs of drying too soon, we still continue to milk her even if the quality of milk does not pay for the time spent. We know, however, that we will be doubly repaid during the next period of lactation, for then she will keep up the flow until the proper time to stop.

A cow that has got into the habit of slackening in her milk flow too soon after calving can be made into a good milker by persistent care. We bought a cow four years ago that in her first season of milking was almost dry in six months. We still milked her, however, and she is now a grand milker.

BH "ENGLISH" PAINT

SAID THE MAN WHO BUILDS.—"Yes sir, I am going to use Brandram-Henderson, Limited, "English" Paint. You don't suppose I would put so much good money in a new house and then paint with cheap paint. That would be absolutely wasteful, wouldn't it? I am building and painting for permanence—and B-H 'English' Paint is the only paint I shall use. None but the best for mine. It wouldn't be fair to the house." 87

Big Ben

Don't set your mind—set Big Ben

Don't bother *your* head about getting up. Leave it to Big Ben.

You ought to go to sleep at night with a *clear brain*—untroubled and free from getting up worries. You men, if you are up to date farmers, work with your brains as well as with your hands. Such a little thing as "deciding to get up at a certain time in the morning" and *keeping* it on *your mind* often spoils a needed night's rest and makes a bad "next day." Try Big Ben on your dresser for one week. He makes getting up so *easy* that the whole day is better.

Big Ben is not the usual alarm. He's a timekeeper; a good, all-purpose clock for *every day* and *all day* use and for years of service.

He stands seven inches tall. He wears a coat of triple-nickel plated steel. He rings with one long loud ring for 5 minutes *straight*, or for 10 minutes at *intervals* of 20 seconds unless you shut him off.

His big, bold figures and hands are *easy to read* in the dim morning light, his large strong keys are *easy to wind*. His price, $3.00, is *easy to pay* because his advantages are so *easy to see*. See them at your dealer.

5,000 Canadian dealers have already adopted him. If you cannot find him at your dealer's, a money order sent to *Westclox, La Salle, Illinois*, will bring him to you duty charges prepaid.

$3.00

At Canadian Dealers.

Barb-Wire Wounds.

If every barb-wire cut was considered dangerous instead of being neglected until the animal is blemished for life, fewer bad results would be the outcome of this frequent accident.

In horses the breast and upper part of the forelimbs is the usual location for a serious wire cut. Sometimes the large muscles in the region of the shoulder to the knee are almost cut in two. The wounds become infected, the pus runs down between the layers of muscle and leaves as a sequel, a stifled-kneed animal with large scars. If the injuries are on the inside of the thighs, the same condition may result in the region of the stifle or hock.

An 'open joint" is more frequently the sequel of neglect than of actual injury. Chances of recovery in this condition are very poor.

PROMPT TREATMENT IMPORTANT.

Ptompt treatment of wire cuts is of greatest importance. If a competent veterinarian can be secured, oftentimes the price of a valuable animal can be saved for the cost of a visit.

If home treatment is the only kind available, the bleeding, if severe, should be stopped with astringent powder, as alum, or with a hot iron. The torn tissues should be rearranged as near like normal as possible, and treated as an open wound. Greasy liniments and ointments should be used with care, paying more attention to keeping the wounds clean. Tar is good in summer to keep away flies. For an antiseptic, a three per cent. solution of creolin is non-irritating and cleansing, but it is best to use very little water on any sore.

The course of healing is varied, due to movements of the part which tears the reuniting tissues. Sometimes the animal bites the itching wound, increasing the infection. Every injury must be treated differently, and each complication met with common sense and patience.—Dr. E. T. Baker, Veterinarian, Idaho Experiment Station.

Change of Pasture.

The novelty of a change, even if it should not be very marked, is obviously appreciated by animals of all kinds. This is shown by the behavior of cattle or sheep when turned into a fresh field, even although the new pasture may be separated from that they have vacated by only a wire fence. The surroundings may be pretty much the same as before, but the pasture is fresh, and, whether plentiful or not, the herbage is eaten with an avidity that implies invigorated appetite. On the ground of health also it is a good plan to rest pastures occasionally, as if constantly grazed they are liable to become tainted and stale. A large area is as subject to this defect as a small, for the number of stock a pasture carries is usually proportionate to its extent, and consequently there is not that immunity from souring in the case of large enclosures that is imagined. Some of the most experienced stockowners proceed on the principle that it is better to make a pasture carry twice its normal complement of animals for three weeks or a month and be given a rest of corresponding duration than to be grazed constantly with its alloted number. The practice is the outcome of careful note-taking of the habits of and progress made by both cattle and sheep.—Field.

BEAVER FLOUR

WHEN IT COMES RIGHT DOWN TO QUALITY BLENDED FLOUR MAKES THE BEST BREAD IN THE WORLD

"BEAVER" FLOUR is made of choicest Ontario Fall Wheat, with enough Manitoba wheat to add "strength" to the dough. This special blend gives the flavor, food value, baking qualities, strength and quantity, as no other one flour can.

When it comes right down to quality and quantity, "Beaver" Flour makes better bread and pastry—and more bread and pastry — than any western wheat flour.

You have only to use "Beaver" Flour once to prove all this to your complete satisfaction.

Sore Shoulders.

Old Subscriber: I have a valuable mare that has had sore shoulders for the past two years. A lump came on the point of the shoulder and on working her it broke out as a sore. I have tried almost every remedy that I have ever heard tell off but without success. When I don't work her the sore heals up pretty well but as soon as I work her a day or two it is as bad as ever. Please advise a remedy.

Sore shoulders and collar galls are very common on the farm and can best be prevented by having collars that fit. A very good method is on returning a horse to the stable to lift up the collar for a moment or two and then replace it, leaving there for fifteen or twenty minutes, the reason for so doing is that the parts under the collar are quite hot and if the collar is removed at once the parts become chilled and a conjested swelling results unless a brisk rubbing is given the parts; the use of a strong solution of alum and water or salt and water to the shoulders after the removal of the harness will serve to toughen the parts. Sores should be treated as ordinary wounds but as in the case in question they are slow to heal. Chronic sores of the shoulder often take on a hard, toughened appearance being termed—sitfasts—such a condition will need the surgeon's attention.

A collar that is a little too large or a little too small may cause sore shoulders. Another frequent cause for sores on the point of the shoulder is in having the draft too low.

Sitfasts are the result of pressure by ill-fitting collars or by irritating masses of dust, sweat and hairs under the collar. The "sitfast" is a piece of dead tissue which would be thrown off but that it has formed firm connections with the fibrous skin beneath, or even deeper with the fibrous layers of the muscles, or with the bones, and is thus bound in its place as a persistent source of irritation. The horn-like slough may thus involve the superficial part of the skin only, or the whole thickness of the skin or even the structures beneath. The first object is to remove the dead irritant by dissecting it off with a sharp knife, after which the sore may be treated with simple wet cloths or a weak carbolic acid lotion, like a common wound. If the outline of the dead tissue is too indefinite, a linseed meal poultice will make its outline more evident to the operator. During and after treatment the horse must be kept at rest or the haress must be so adjusted that no pressure can come near the affected parts.

If the sore in question is not a "sitfast" but an ordinary wound poultice it to draw out the inflamation after which keep it as clean as possible by the use of some antiseptic and see that the collar fits properly and that the draft is not too low.

Making Official Records.

One indication of the progress that is being made in the dairy world is the great number of official records that are being announced from week to week. All of the breed associations are following this work enthusiastically. The Holstein- Friesians used to issue an announcement of about 100 cows once in two or three weeks. This season they have had to double that capacity in order to take care of the records that are being made. TheGuernsey Association says that the advanced register has grown so rapidly that today 726 cows are in the yearly test, which is the largest number and represents more breeders than have ever before been entered. The same thing is true in the other breeds, all of which is merely a promise of what is going to be accomplished in the future. Watch the official advanced registry work grow. It is the index of merit that is being demanded by the small breeder, the dairyman who wants to purchase only one or two calves, and by the extensive breeder alike.—Kimball's Dairy Farmer.

There is no real need of anyone being troubled with constipation. Chamberlain's Tablets will cause an agreeable movement of the bowels without any unpleasant effect. Give them a trial. For sale by all dealers.

"It Took Me Fifty Years to Know How to Give You Better Roofs than any other Man"

"I tell you, every farmer in Canada should realize the big share a good roof has in making a good barn. That is my life-work—making roofs. I have been making my roof better and better for more than fifty years. What I have done for farm roofs is one of the biggest things ever done for people who farm."

"You ask me why a barn roof is so important. I will tell you. You build a barn and expect the roof to protect it many years. You put thousands of dollars' worth of produce under that roof while it lasts. Every pound of this produce costs you hard work. If a poor roof lets it get spoiled by wet, you lose money year after year. This lost money is many times the roof cost. Some roofs will last for several years. Some roofs will last if they are kept painted. But a roof is mighty hard to get at. It is not too safe to work on anyhow. Once a roof starts to leak, it is often left as it is. The result is the things you have in your barn spoil. This is lost money, and soon amounts to more than the cost of a good roof."

A Roof for Any Man

See What a Good Roof Can Do!

"I have spent my life making a low-cost roof that any man or his tinsmith could lay right. This roof of mine saves the stuff stored under it. It saves the barn framing and beams. It saves the foundation. This roof of mine doesn't need special roof timbering at all."

Good for 100 Years

"The big point about my roof is that it cannot develop leaks after you have had it up a year or two. It is a real roof from the first year it is on your barn to the last year. And do you know when that 'last year' will be? You will use that barn, and your son will use that barn, and your grandson will use that barn before that 'last year' comes. I want to pound the fact home to you that when you get a roof from me, you get a roof that is good for one hundred years. Think of getting a roof that makes your barn good for a hundred years. And that at about the price of an ordinary roof."

"That is why I say, 'I have helped the farmer more than any man ever did.' My roof will protect a good $100,000 of produce in your barn in 100 years. A roof that will do that is worth going after a good long ways."

Stands the Arctics

"This roof is so good that the Canadian Government Bernier Arctic Expedition used it for the Arctic regions. Here is immense cold and sweeping winds and ice and poor foundations to stand up under. The North-West Mounted Police use it. The Canadian Government has found no better roof for them. My roof is a good roof for the Arctic Circle. It is a still better roof for milder climates elsewhere."

Stands the Tropics

"But that is not all. My roof is used in the West Indies. Here is a temperature of 135 degrees at Porus, Jamaica. My roof stands it. In Jamaica during rainy season at Montego Bay, rain falls 10 inches in a single day. My roof stands it. In Ontario rain falls 30 inches in a whole year. My roof in Jamaica stands in 24 hours the rainfall it has easily 4 months for in Ontario. Is that a good roof? Is a roof that stands the severe conditions in both Arctics and Tropics good enough for you? You get exactly the same article, made on the same machines."

Used All Over the World

"Not only that, go down to South Africa. Go to the farms there. Go around Port Elizabeth, or Durban, or up in the Transvaal. You'll see my roof there. People will go around the world for my roof, because it is the best roof in the world. It will last 100 years. People use my roof in Japan—an earthquake country. They get it from me. They have searched the world for a roof that would stand earthquake straining. My roof will."

This Took 50 Years

"You are beginning to see something of the big work I have done. I have made a low-cost roof that stands terrific cold and heat, that stands tremendous strains, that stands ice, that stands earthquakes. In fifty years, I have made Pedlar roof better and better by little points added every year. It has world sales to-day, just because it is the best roof in the world at its very moderate price."

MY LATEST TRIUMPH

"Then, a few years ago, I put my finishing touch that made my roof wonderful. I had been troubled, not by my roof design, but by the metal in it. It seemed impossible to get a metal which would not rust. I had to take the best metal I could get. The design was all right. I had been making that design better for fifty years. At last I struck a clew in Europe."

"You know they have cathedrals there that are hundreds of years old. Yet the iron hinges on the doors are as good as ever to-day, though they were hammered out hundreds of years ago. I said to myself, 'Why not make up my roof in this peculiar kind of iron, so my roof will last like those door hinges?' Well, sir, that was a hard job. It was hard to get that iron duplicated. I worked for a long time and my chemists worked with me to get it. I stuck to it just as carefully as I had stuck to bettering my roof. And I got it at last. That's the metal I use to-day."

You Get the Benefit

"My roof is the only roof in the world with this kind of non-rusting iron in it. I am the only man a farmer can come to and say, 'I want a hundred-year roof at about the price I would pay for cedar shingle.' I am the only man that can deliver that kind of goods.

"My roof will not rust to the leaking point within 100 years. It saves the barn and its product from the weather. It saves the barn from thaw-water and lodged ice, because the seams cannot be gouged apart. It saves the barn from fire, because sparks cannot burn it. A burning stick on the roof will not harm it, or harm the barn under it. Lightning cannot burn a barn with my roof on it. My roof is a perfect conductor of electricity. My roof has 'give' in it to defy heat and frost, and protects in winter and summer. It protects even though the rafters sag. Wind cannot blow my roof off a barn. This is because it is a ventilated roof. It keeps your barn ventilated and stands the heaviest winds safely."

Get My Barn Book

"I want to send you my book, 'ROOFING RIGHT.' This lets you dig into more facts about the Pedlar roof. You will see how clean it is. It gives the best cistern water you can gather, as it is self-cleaning. This book shows scores of good barn designs—the best barns in Canada. Every one has my roof on it. You will get big help from my book, and I will send it free for a post-card, because you can plan your barn from it, whether you use my 100-year roof or not."

326

"I am the best friend the farmer has, because I have given him one of the best roofs in the world at a very low cost. I want to send out more of my barn books, because I want to see good barns built. I send a book free to you, if you will ask for it. Write me to-day."

UNIVERSITY OF ILLINOIS

PUBLISHED TWICE-A-MONTH

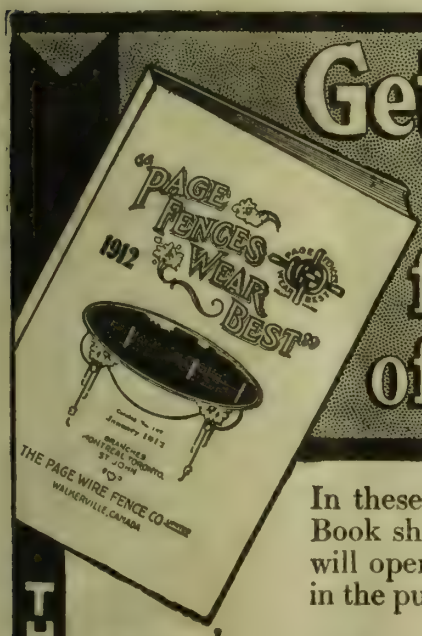
The MARITIME FARMER

AND CO-OPERATIVE DAIRYMAN

Published Twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada.

Vol. 17. ST. JOHN, N. B., JUNE 25, 1912 No. 18

Get this New Page Book -and learn how to equip farm, factory, home and office at factory cost.



THIS COUPON BRINGS

In these days of high cost of materials this remarkable new Page Book should find a hearty welcome in every home in the land. It will open your eyes to great savings—savings that can be made in the purchase of things needed every day as equipment on the farm, in the factory, home or office. Don't pay the usual prices—get your copy of this book to-day, and learn how to buy right.

THE REGINA PNEUMATIC CLEANER

The Regina Pneumatic Cleaner is wonderfully easy to operate. Light weight. Double vacuum pump cleans far better than ordinary methods. Cost low.

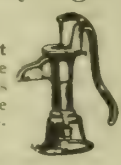
37 varieties of Page Fence in weights and mesh to suit all needs.

PIANOS

Made by one of the most famous makers on the continent. Rich, pure, lasting tone. A beautiful instrument.

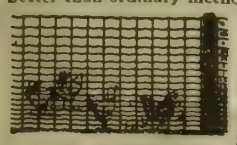
PAGE IRON FENCING

Many designs, simple or ornate. For any purpose. Any price.



PUMPS

Made by one of the most famous concerns on the continent, Aylmer pumps are known everywhere for their fine construction and perfect work.



KITCHEN CABINETS

Finely built, beautifully finished. Save miles of walking around a hot kitchen. No bending over flour bins, no straining to reach things on high shelves. Protects food from dust, dirt, flies and mice.

PAGE "SPECIAL" POULTRY FENCE

Graduated mesh. Will turn poultry or large stock.

SCALES

Every scale is sold with a Government certificate guaranteeing its correctness. In all sizes for all purposes. Strong, compact.

HANDY WAGONS

These Handy Wagons are of the best. In all sizes, one or two horses, with or without boxes, Studebaker skeins, hickory axles, oak woodwork, steel wheels.

FAMOUS PAGE GATES

Acknowledged leaders of the world. Prices lowest.

FENCE TOOLS

We sell every tool needed in erecting any kind of Page Wire, or Iron fence; post hole diggers, bolt cutters, staples, locking tools, safety blocks and tackle, iron posts, fence anchors, etc.

STEEL RANGES

This famous make saves from 15 to 20 pounds of coal a day when used continually. Magnificently constructed. Bakes perfectly in a third of the time necessary with the old cook stoves. Asbestos lined flues, anti-clinker grates.

SOME PAGE PRODUCTS

Besides the articles illustrated, here are some of the Page products:

Lawn Fence	Fire Escapes
Poultry Netting	Waste Baskets
Marine Engines	Delivery Baskets
Wagons	Staples
Steel Posts	Horse Muzzles
Player Pianos	Jail Cells
Wire Cloth	Wheelbarrows
Wire Signs	Warehouse Trucks
Concrete Reinforcement	Tile Machines
Wire Partitioning	Paper Balers
Wire Mats	Pulleys
Window Guards	Belting
Tree Guards	Rubbish Burners
Office Fittings	Sleighs
	Grinders

and many more too numerous to list

PORTABLE GAS ENGINE

1 1-2 H. P. 4 cycle. For either gasoline or kerosene. Simple, efficient and very difficult to get out of order.

SAVE BY BUYING DIRECT

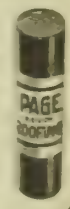
Page Wire Fences and Wire Products are known by thousands for their quality and their low price. In the same way the many lines in this new Page Book (which you get by sending the coupon) give you the greatest values the dollar can buy in each line. You buy direct and save go-between profits. You buy from a house rigidly interested in keeping up quality. Everything shown has got to be, and IS, right—a big-value bargain. Become a Page customer along with other prosperous thousands of wise buyers. The first step is to send the coupon for the catalogue. The Page Book gives items that surrounded you with their usefulness and value to YOU in your daily needs. Send to-day.

PAGE HOUSE PAINT

Mixed ready for use. A strictly high-grade paint intended for exceptional wear. Inside or outside paints, floor varnish etc. Send for free color chart.

PAGE ROOFING

The Roofing sold by the Page Company is the result of years of experience by a manufacturer known for the high quality of his product. It will not only afford perfect protection but will last for many years in perfect condition.



STEEL WHEELS

Can be used on any gear or put on your own farm wagon. Fit any axle or spindle. For any kind of wagon from a log cart to a traction engine. Proved quality of steel and iron to last forever.

You can readily see what a big line of farm and home equipment the Page Company places at your disposal—and every article at factory cost. Get YOUR copy of this money-saving book to-day—use the coupon NOW—before you forget it. Or send postal to

Better Hay- Easier Work- More $$

If you grow upwards of ten acres of hay a year it will be to your profit to get these machines. Quit loading by manual labor, and adopt the improved methods provided by the **Champion** Side Delivery Rake and **Champion** Hay Loader.

The **Champion** Side Delivery Rake would save a lot of time for you. And the hay would be cured better, because the **Champion** throws it into loose windrows so that the wind can easily blow through it.

The **Champion** Hay Loader is so sure and quick in operation it makes loading by fork seem extravagant waste of time. Puts up the hay just as fast as you can handle it on the load.

If the weather is threatening, necessity demands speed in getting the hay into the barn. Many's the time farmers have been saved from suffering heavy losses from storms by the quick work of the **Champion** Hay Loader.

Let us send you our Haymaking Catalog. In it you will find many more reasons why it is the height of wisdom to make this **Champion** investment.

Here Are Two
Frost & Wood
Haymakers

CHAMPION
Side Delivery Rake and Hay Loader

Nearly three-quarters of a century's experience in making farming machinery for Canadian farmers has given us a very thorough knowledge of conditions that farm implements are required to meet in all sections of the Dominion. That we also know how to build machines that will successfully meet Canadian conditions is evidenced by the great reputation of the Frost & Wood Line.

The name Frost & Wood is associated with RELIABILITY, and with the most advanced methods of farming. It stands for progress. It also stands for Quality—and a large measure of it for every dollar you invest on a Frost & Wood machine. Satisfaction goes hand in hand with greater profits for those who use Frost & Wood Quality Machinery.

THE Keeley Cure FOR LIQUOR AND DRUG USING

Over Thirty Years of Success Due to Honesty, Safety, Certainty

The Keeley Remedies have been administered for more than THIRTY YEARS and are recognized by the public at large, as well as the medical profession, as being the most efficacious treatment known for the diseases which they are designed to overcome.

We have cured thousands of veterans of the War of the Rebellion in the National Soldiers' Home of the country, whose ages range from fifty to eighty years.

We have cured several children under five years of age who were addicted to morphine and opium, such addictions having been acquired through the mother's own addiction or direct administration. No constitution is too delicate for the Keeley treatment, as the remedies are perfectly harmless.

We have cured hundreds of soldiers in the Regular Army of the United States, and have letters from officials of all ranks, from major-generals to lieutenants, commending the Keeley Cure in the highest terms,

We have cured Senators, Congressmen, lawyers, clergymen, business men—merchants, laborers, men of all occupations, and of no occupation, to the number of over 400,000. Among them are 20,000 physicians.

The treatment removes all craving or desire for liquor or drugs, restores the nervous system to a normal condition, clears the brain and makes a man out of a nervous wreck.

Patients are not confined; there is no irritating or vexatious restraint.

There is no Nausea or other sickness attendant upon or caused by our treatment. Improvement begins at once and continues throughout entire conrse of treatment.

We have special accommodation for ladies, where they can be entirely exclusive, and can be treated as privately as in their homes.

Printed matter and particulars by mail in sealed plain envelope.
All letters promptly answered and treated as strictly confidential.

"Have you heard of the wonderful One Hoss Chay
That was built in such a logical way
It ran a hundred years to a day ..... ?"

Well, the ENTERPRISE MOMARCH STEEL RANGE is built like that. There's no "weakest spot" in the Monarch. The body of the range is made of "Steel of the finest, bright and blue," and every part throughout is perfect in fit and finish.

Being ornamental, easy to keep clean, simple to operate, accurate and economical, this range will endear itself to the housekeeper as the "one horse chay" did to the family of the Deacon. Like the chaise too, the "Monarch" is a "Wonder and nothing less."

With it's extension fire box for wood burning, and good supply of hot water, the Monarch is particularly adapted to farm kitchens.

Ask the nearest Enterprise dealer to show you this range, or write us direct for circular and particulars.

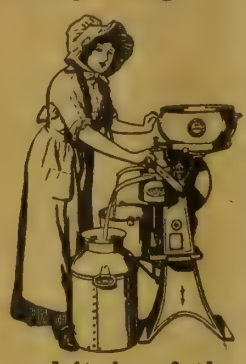
Manufacturers Sackville, N. B.

DE LAVAL
CREAM SEPARATORS

Cheapest As Well As Best

Every sensible person wants the **best** of everything, but in many things the best is beyond their means and they must necessarily be content with something else.



In the case of the Cream Separator, however, the **best** is fortunately the **cheapest** as well, and it is of the greatest importance that every buyer of a separator should know this.

Moreover the **best** is of more importance in the case of the Cream Separator than in anything else, since it means a saving or a waste **twice a day every day in the year** for many years.

It is true that DE LAVAL Separators cost a little more in first price than some inferior separators, but that counts for nothing against the fact that they **save their cost every year over any other separator,** while they last an average twenty years as compared with an average two years in the case of other separators.

And if first cost is a serious consideration a DE LAVAL machine may be bought on such liberal terms that it will actually **save and pay for itself.**

These are all-important facts which every buyer of a Cream Separator should understand and which every local DE LAVAL agent is glad to explain and demonstrate to the satisfaction of the intending buyer.

If you don't know the nearest DE LAVAL agent please simply address the nearest of our main offices as below.

173 William Street, MONTREAL, CAN.

DE LAVAL DAIRY SUPPLY CO., Limited.

14 Princess Street, WINNIPEG, CAN.

Put Any Weight on a Maritime Fence

and it stands the test. Man or beast can't break it down. Maritime Fence never sags or gets out of shape. Made from extra heavy imported hard drawn steel wire, thicker, stronger and galvanized so it is peel-proof. It is the last word in strength and durability.

The staying quality of Maritime fence is in the simple lock with the bull dog grip. It never lets go—never lets the fence get crooked. Maritime Fence is always sightly; always straight—always best. The quality of material and construction makes it best.

Don't buy fence until we have put our catalog and price list into your hands, postpaid, by mail. Costs you nothing to find out all you want to know about wire fence. Get your pen now and write on a postal "Send the catalog." 9

Volume 17. ST. JOHN, NEW BRUNSWICK, JUNE 25, 1912. Number 18.

Remedies for the San Jose Scale.

Their Timely Application will Safe-Guard Orchards Against the Fruit Growers' Worst Enemy.

OWING to the rapid extension of the scale-infested areas in Ontario and the threatened visitation to the Maritime Provinces orchards, it is essential that the fruit growers should be thoroughly acquainted with the latest methods both for summer and winter treatment of this dread pest. Considerable experimental work has been done by the Department of Agriculture in conjunction with the growers during the past few years, and the results of these experiments, together with the mature opinion of those who have for several years been fighting the scale most successfully in the United States and Canada, are here given.

WINTER TREATMENT

The standard remedy in use in Canada is the steam or fire-cooked lime-sulphur mixture. That is the cheapest and most effective of the washes now applied, and as it is of such great fungicidal value this largely compensates for its caustic action on men and appliances where it is being used. Taking all points into consideration, and assuming that the wash is properly prepared and thoroughly applied, this mixture takes first place as a commercial remedy for the San Jose Scale, and until something as good or better is discovered, the Department of Agriculture feel bound to recommend its more general use.

LIME-SULPHUR MIXTURE

The usual formula is as follows:

Lime	20 pounds.
Flowers of Sulphur	15-20 pounds.
Water	40-50 gallons.

To prepare this mixture, have 12 to 14 gallons of boiling water in the barrel before adding the lime. The lime should be the best stone lime procurable. The flowers of sulphur should preferably be mixed into a paste with hot water and added immediately after the lime has been thrown in. The mixture should then be boiled till the characteristic green or amber color is obtained. This varies with the kind of lime used, and may take from three-quarters to one and a-half hours. Many authotities still advocate boiling for two hours or more, but good results have been obtained with less boiling so that one is safe in reducing the time. provided the proper color is obtained. Keep a hoe in the barrel and stir occasionally from the bottom to prevent the mixture from burning. Dilute with water to fill up the barrel, strain thoroughly into the pump and spray while warm. In this condition it passes more readily through the pump and nozzles. It is essential in all the lime mixtures to have a good strainer. The best is the galvanized or wood pail strainer with a cone of brass netting (30 to 50 meshes to the inch) fastened with its base in the bottom of the pail. Make the cone large and pointed, reaching to the sides of the pail at the bottom, and about two-thirds of the height, Five or six stiff wire supports distributed evenly around the bottom of the pail and soldered together at the tops will form a good frame for the netting. A small opening is cut in the bottom, and a cylindrical tube of any desired length soldered around it. This serves as a funnel in directing the flow of the liquid into the tank or barrel. By pouring the mixture slowly on to the point of the cone, the netting is kept clear by the force of the liquid, and the screen does not clog as quickly as when the strainer pail is filled to the brim and allowed to gradually empty.

Some growers complain of the difficulty in keeping the pump in good working order with this mixture. However, little trouble will be experienced if the nozzles are rsmoved every night and placed in coal oil, and a couple of pails of water run through the pump and hose while the lime mixture is still soft. A little attention at the time, and a thorough cleaniug at the end of the spraying season, will go a long way toward keeping this now essential part of the farm machinery in condition.

SELF-BOILED LIME-SULPHUR MIXTURE

The proportions given for this mixture vary about as much as for the steam or fire-cooked mixture.

Lime	25-35 pouads.
Flowers of sulphur	15-18 pounds.
Water	40-50 gallons.

In making up this mixture, have 12 to 14 gallons of boiling water in the barrel. Add the full quantity of lime and throw the sulphur paste on top. Cover quickly with a piece of old carpet or sacking, and put a heavy block of wood on top, as the steam and heat generated is so strong that it would otherwise blow the mixture out of the barrel. Keep the hoe stirring slowly from the bottom. Allow to boil for 40 minutes, then fill two-thirds full of boiling water and let stand for ten or fifteen minutes longer. Watch for the green color as with the previous mixture. When ready, strain into the spray barrel and make up to full quantity with hot water.

Some growers put in but a part of the lime at the start, and add the remainder as soon as the first violent boiling is over, The addition of six pounds of caustic soda to prolong the boiling has been recommended, and the experiments in the Niagara district with this mixture in the proportions given below were followed with fairly good results:

Lime	30 pounds.
Flowers of sulphur	15 pounds,
Caustic soda	4-6 pounds.
Water	40-50 grllons.

The addition to the cost, however, has militated against the free use of caustic soda. Considerable quantities of the self-boiled mixture have been used the past few seasons; but many growers consider that as the water has to be heated for the preparation of this mixture they may as well boil the whole mixture and thus be sure of obtaining a more efficient remedy for the Scale. Neither the self-boiled nor caustic soda mixture are recommended where the facilities are at hand to properly prepare the standard fire or steam cooked mixture. However, to the owner of a few trees these mixtures will be of great value.

CRUDE OIL

Crude oil has been used very largely in Niagara township from the first, but the lime-sulphur mixture has almost entirely replaced it. Tender trees such as the peach and Japan plum were not able to resist the burning of the oil and many trees were destroyed. In the Chatham district, on the other hand, its use up to 1906 was quite extended. This was largely due to the presence of the oil wells in the immediate vicinity, and to the fact that it was used almost entirely on apple and pear trees, which are more resistant. The spraying of large apple trees with the oil is an easier task than with the iime-sulphur mixtures. The growers in the west, however, are not satisfied with the oil treatment, and are looking for a better mixture. In the use of crude oil, it is essential that the oil be applied as lightly as possible and with this end in view, the nozzle should throw a very fine spray. An oil of as high specific gravity as possible should be procured. The heavy, rough

bark of the trunk and main limbs seem to soak up large quantities of the crude oil, and special care should be exercised in spraying these portions as lightly as possible, consistent with thoroughness.

WHALE OIL SOAP.

Whale oil soap .... 2½ gallons.
Water .... 1 gallon.

This remedy also, while once largely used, has been replaced in Ontario with the lime-sulphur mixtures, However, for the small orchard, it is still a standard remedy, and will do good work if used strong enough. Mr. Geo. E. Fisher recommends 2½ pounds to the gallon applied very thoroughly before the buds open and after frosts are over. The soap is thoroughly dissolved in a kettle over a fire, poured into the pump, and applied while still hot. While easily prepared, this insecticide is much more expensive than the lime-sulphur mixtures, and has given less favorable results.

SUMMER SPRAYS.

In Ontario, practically no spraying is done during the summer for the San Jose scale. The danger of injury to the foliage and the difficulty of reaching all parts of the trunk and branches owing to the heavy foliage, have been the main reasons for such conditions. Further, owing to the fact that this scale is many brooded, and that the summer washes destroy pr acticallyonly the running larvae, it becomes necessary to apply the mixture every four or five days for perhaps five applications before the female scales become exhausted. However, where a determined effort is being made to stamp out the scale, these mixtures may be used as adjuncts to the winter washes.

KEROSENE EMULSION.

Hard soap .... ½ pound.
Boiling water (soft) ... ½ gallon.
Coal-oil .... 1 gallon.

This mixture is prepared as follows:—

Dissolve the soap in the water, add the coal-oil and stir well from five to ten minutes. A good way to mix the soap and oil is to violently pump the mixture into itself. When properly prepared, it will adhere to glass without oiliness. In using for the scale dilute with six parts water for hardy trees and with seven parts for peaches and Japan plums. Use a coarse spray so as to break through the foliage and reach the twigs and branches. Spray in bright, dry, airy weather. Apply every four or five days for several applications.

CRUDE OIL EMULSION.

Water .... ½ gallon.
Hard soap .... 2½ gallons.
Oil .... 1 gallon.

Prepare in a similar manner to the Kerosene Emulsion, but apply diluted, 1 to 10 parts water, and spray with a finer nozzle than the preceding mixture.

WHZLE OIL SOAP.

This may be used as a summer wash at the rate of ½ pound to the gallon of water. Prepare in a similar way to the summer wash.

PROPRIETARY MIXTURES

In the search for better remedies for the San Jose scale, a number of oil mixtures have been placed on the market in the United States and Canada and extensively advertised as sure cures for the scale. Among these may be mentioned Kil-O-Scale, Scalecide, and Target Brand Scale Destroyer. Extensive experiments have been carried on with these mixtures with very varing results. The consensus of opinion seems to be that at the strength recommended by the manufacturers, these mixtures will not give uniformly good results, and that if used at strengths sufficient to hold the scale in check, the cost of the resultant mixture would be so great as to preclude its use in commercial orchards. For the small home orchard, or for use on ornamental or fruit trees and bushes in city or town lots, these mixtures, on account of ease in preparation and freedom from caustic action so disagreeable with the lime-sulphur mixtures, will likely find a fairly large market. Until further improvement in the mixtures themselves, or a decided reduction in the price has been Growers'Association, January 3, 1907, made, their use in the larger field of operation is not recommended.

TREATMENT FOR SCALE IN THE UNITED STATES.

Below will be found a nuber of extracts from the latest bulletins and addresses on the San Jose Scale:—

Mr. L. L. Morrell, Kinderhook, N. Y., before the New York state Fruit Growers' Association, January3, 1907, said in part:

"It is a fight first, last and all the time. I have had the scale for sixteen years, have used all the different remedies of the past up to lime and sulphur, which I am using now. I use 15 pounds sulphur, 20 pounds lime in 50 gallons of water, the sulphur being put in after the lime has slaked; I boil it by steam until it is a dark amber color, at least one-half hour, and then apply while hot. I can put on 800 to 1,000 gallons per day with two men besides myself. It requires your absolute attention; you must touch every scale if you want to kill it. Spray with the wind, the top of the trees first, and the under side of the branches last. I have less scale to-day than eight years ago, and would not be afraid to set more trees if I wanted them. Success is a matter of thoroughness all the way through."

Mr. T. Grenier, La Salle, N. Y., reporting to the New York Tribune-Farmer the meeting of the Western New York Horticultural Society, held at Rochester, January 24, 25, 26, 1907, states in part as follows:

"The San Jose Scale, of course, came in again for the lion's share of attention, discussion, and especially denunciation. There can hardly be any doubt that a large proportion of the eight hundred who had come to the Rochester meeting had been brought to the point of attending such ameeting merely because they were scared into it by the scale. The outlook for orchardists whose orchards are invaded by the scale, and who fail to wage an incessant warfare against the pest, is, according to Willard Hopkins, about as follows: First year, scare; second year, barrel stock; third year, evaporator; fourth year, cider mill; fifth year, wood pile or saw mill. Mr. Hopkins also told of his complete success in controlling (not exterminating) the scale by thorough spraying. He has used both lime sulphur washes and crude petroleum. He said that one cannot put on enough lime-sulphur to do injury to the tree, but the stuff is terribly corrosive to the skin. He uses heavy blankets or oilcloth, covering the horses entirely over. George T. Powell indorses Mr. Hopkin's predictions, and says that 90 per cent. of the orchards on Long Island are infested by scale, and 75 per cent. have become perfectly useless. By spraying with scalecide, one to twenty, but very thoroughly, he has brought the scale under control. He has saved (by the former strength) a Prunus Pissardi, Pyrus Japonica, etc

The time for applying scalecide is in autumn alter the foliage is off, and again in February or March, it being advisable to make two applications to do the best and most thorough work."

Professor P. J. Parrott, before the Ontario Fruit Growers' Association, November 7, 1906, spoke as follows; "The San Jose Scale is rapidly spreading into our leading fruit-growing sections of New York. In those communities where it is well established, annual spraying for the scale is practised by the more progressive fruit growers The orchardists experienced in this work are fighting the scale efficiently and profitably upon peaches, plums, pears, and apples of moderate size. The spraying mixture which gives the most satisfactory results on scale is the boiled lime-sulphur wash. This is used by the larger number of our fruit g- -ers, although some are using the proprietary miscible oils or mineral oils, either clear or emulsified."

"Sulphur washes are cheap, safe and reliable sprays for the treatment of peaches, plums, pears, and apple trees of moderate size, and is specially recommended for the treatment of peaches for joint control of scale and leaf curl. Applications must be thorough. Good nozzles and a pump with high pressure to produce a fine spray are essential. Cost of spraying per tree is valuable, depending on management, weather conditions, labor, kind and cost of feul and spraying supplies, and degree of thoroughness in spraying. In spraying trees from five to eight years of age, the cost of treatment will vary from 5c. to 13c. per tree in commercial orchards. Apples from thirty to fifty years of age will cost from 20c. to 50c. per tree to obtain reliable results on scale."

"Treatment of old apple orchards has not been usually successful and is largely due to lack of thoroughness in spraying. The best results on scale for these large apples are obtained by careful pruning of trees and by spraying with sulphur washes and crude petroleum on alternate years. By this system of treatment, orchardists that were fearful of losing their orchards have this year marketed comparatively clean crops. Average cost of sulphur wash per tree, 36c., crude petroleum, 59c. Crude petroleum is a most efficient spray on scale, but may injure trees. It is believed that for results of work, applications of sulphur wash or crude oil emulsion, twenty-five per cent. oil, would prove equally effective on scale without risks of appreciable injury to trees. Commercial insecticides, in all but two of experimental orchards, were much less effective than the sulphur wash."

C. L. Marlatt, of the United States Department of Agriculture, in Bulletin No. 62, issued December 5, 1906, states as follows: "The control of the San Jose Scale by parasitic and predacious enemies is increasing all the time, but there seems to be no likelihood that either such natural enemies as are now in this country or those which may hereafter be imported will ever do more than merely lessen the abundance of the scale. In other words, from past experience, and from large acquaintance with other similar scale pests, it is extremely improbable that even under the most favorable circumstances will such natural enemies reduce this scale as much as would one thorough treatment with the lime-sulphur wash or other standard remedy."

..."The methods of control which have been especially followed in the Eastern States are (1) the lime sulphur wash, (2) the soap treatment. (3) treatment with pyre kerosene, (4) treatment with crude petroleum, (5) treatment with mechanical mixtures of either of the last two oils with water, and (6) petroleum emulsion with soap. All of these methods have proved themselves successful against the San Jose Scale when properly carried out. As compared with the lime-sulphur wash, the others mentioned are more expensive, and the two oils, unless carefully applied, are likely to injure the treated plants, and are now seldom used. One's choice of method must therefore be governed by availability, special needs and experience."

"A vast amount of experience of the most practical kind gained since 1894, contributed to by all the eastern experiment stations and by the big commercial fruit growers of the Middle and Eastern States, has fully demonstrated the practical merit of this wash and its superiority to others in point of safety to trees and in cheapness. The wash is furthermore a valuable fungicide, and is notably useful against the peach leaf curl, sprayed trees being practically immune from this disease, so that the cost of treatment is often more than made good by the fungicidal benefit alone. Its disadvantages are the difficulty of preparation and the heavy wear which it entails upon the apparatus— objections, however, which do not offset its notable advantages, particularly for orchard work or where the number of trees to be treated is sufficient to warrant the trouble of its preparation. It is, in fact, the standard spray now used in commercial orchards for the San Jose Scale."

The following summary is taken from Bulletin 21, October, 1906, of the Georgia State Board of Entomology, by R. I. Smith, State Entomologist:

SUMMARY.

Boiled lime-sulphur wash is recommended as a remedy for the San Jose Scale.

Salt in the wash does not appear to be necessary or desirable.

Soluble oil sprays should be used cautiously. Do not depend entirely on these preparations without first giving them thorough test on a small number of trees.

Badly infested orchards should be sprayed twice; once in fall and again the following spring.

Orchards which cannot be sprayed twice should begiven one thorough spring spraying.

Large orchards will have to be partly sprayed in fall or winter, and the worst infested portions of the orchard in spring. Or better yet, spray the worst infested portions both fall and spring.

Convenient, serviceable boiling arrangement must be provided for boiling lime-sulphur wash.

Steam boiling outfits are most desirable when considerable quantities of lime-sulphur must be made.

Iron kettles may be used for boiling small quantities of lime-sulphur wash. When such kettles are used set them in a brick arch.

Spray pumps capable ofgiving sufficient power to throw a strong spray should always be used. Whenever more than a few trees are to be sprayed, it does not pay to attempt to use small, cheap spray pumps.

Thoroughness in spraying is necessary in order to secure satisfactory results. This rule applies no matter what mixture or solution is employed for spraying the trees.

The lime used in preparing lime-sulphur wash should be a calcium lime instead of a magnesia lime. The latter is not desirable.

Sulphur may be purchased in different forms, but the grades most highly recommended are "flour" or "flowers" of sulphur.

Self-boiled lime-sulphur washes may sometimes be used with success, but they are not recommended for general use on account of the extra expense involved.

The addition of tar, potash lye, copperas, bluestone, or any other substance to the regular lime-sulphur wash, does not appear to be necessary or desirable on account of making the mixture more costly.

Experiments conducted by individuals often result in valuable discoveries. Fruit grult growers are urged to make experiments with any remedy for the San Jose Scale, but to do so on a conservative basis.

The San Jose Scale may be kept in control if all who have infested orchards will apply tde remedies recommended. It is better to spray orchards from one end to the other when

only a few trees are actually found infested, and thereby prevent injury, rather than to delay the spraying until the orchards become badly infested by the scale.

Editor's Note—Commercial Lime Sulphur is manufactured in Nova Scotia by the Niagara Spray Co., Kentville, N. S.

Banner Sale of Live Stock at Ormstown, Quebec.

This beautiful village is situated on either side of the winding Chateaugay river which flows through one of the finest farming sections in all Canada. Settled largely by Scotch people in the early days, their decendents like their forebears are good stockmen. Two years ago the leading stockbreeders, among them Dr. D. McEachran and Robt. Ness, considered the advisibility of holding an annual Spring Show and Sale, and in 1910 and 1911 held a sale of horses with a measure of success. This so encouraged the breeders that a sale of Holstein and Ayrshire cattle and horses was arranged for on a large scale. This took place in the new Stadium on June 14th., 1912. Altogether 16 Holstein cows, 85 Ayrshires of all ages and 7 Clydesdales mares besides a number of teams and single horses went under the hammer, so well weilded by Auctioneer, A. Philps of Huntingdon, Que. whose reputation as a live stock auctioneer has become widely known. For dispatch and securing bids he has few equals.

This sale was held in connection with the annual Spring Show thus the animals were in fine form. The horses and Holsteins were sold in the morning, the Ayrshires in the afternoon.

The Clydesdale fillies offered were a choice lot, all personally selected in Scotland by Robert Ness, who selects only the best. They realized fair prices and within the reach of the average farmer.

The Holsteins offered were all animals of high class breeding and individuality and should have realized higher prices. The number offered was rather small to attract many buyers. It is possible the Holstein breeders did not bestir themselves to induce purchasers to come as the Ayrshire breeders did.

The Ayrshire offering made a fine display, and buyers were present from many sections of the United States and Canada. When Mr. Fieldin of the Brantford Farms, Groton, Conn. and P. Ryan of Brewester, N. Y. both want the same Ayrshires, bidding goes lively. Mr. Ryan is an admirer of the Old Hall family and secured several prizes of that breeding.

Things got exciting when $1000. was offered for Old Hall Beauty 6th which Ryan secured at $1100. There was still greater excitment when the two year old heifers, Shewalton Mains Beauty 3rd. and Redhills Nameless Charm were knocked off at $1100. also, Feildin secured Srockerton Primrose 3rd at $1000. Mrs. Erhardt of Berlin, Vt. secured a prize in Threave Snowdrift and John Sherwin of Cleveland, Ohio, got a lot of choice heifers at reasonable figures. Canadian buyers were not outdone by the breeders from across the line and several choice animals went to breeders in the district. Ness, Gordon and McArthur know a snap when they see it and coveted animals before the sale were secured by them, as well as others, among whom was Prof. Barton of Macdonald College who got several young females from heavy producing stock. The average on the whole was good, 85 animals realizing $27785. an average of $327. each. This is not quite so high an average as the average at the Hunter sale last year when 117 animals realized $40.-215 an average of $343.50 each. At the Hunter sale cows averaged $409. at Ormstown $360. Two year old heifers, $371. at Hunter's at Ormstown $380. Yearling realized $345. each at Ormstown as against $243 at Hunter's.

On the whole the Ayrshire breeders have reason to feel satisfied with the results of their efforts. Auctioneer Philps knocked the Ayrshires off in about two hours.

To Neil Sangster, President of the Association, J. P. Cavers, Chairman of the Sales Committee, R. R. Ness and Gilbert McMillan, who got up the Sales Catalogue, looked after the advertising and wrote up the subject of the sale, must be given the credit of making the sale the successthat it was. This sale will be an annual occurance and as the district becomes better known as a breeding ground for high class stock so will it attract high class buyers.

Demonstration Farms in the Maritime Provinces.

Messrs. F. C. Nunnick and John Fixter of the Agricultural section of the Conservative Commission are in the Maritime Provinces organizing demonstration farms and endeavoring to interest farmers in better agriculture. They are meeting with marked success and have already succeeded in forming several agricultural associations.

The work began in New Brunswick on May 16, when a meeting was held at Hartland, Carleton County. It was a great success much interest being shown in the movement. Although only one farm is chosen in each county for demonstration purposes many farmers expressed their willingness to co-operate in the better farming movement. The name chosen by the farmers for their organization was the Carleton Agri, cultural improvement Association. The officers elected were: President, Dr. McIntosh (grandson of the originator of the famous McIntosh Red apple); 1st vice, N. Shaw; 2nd vice, C. Ridout; secretary-treasurer, E. C. Morgan. The farm chosen belongs to Shaw Brothers.

In the parish of Norton, King's County, N. B., a farmer's club was organized, to be known as the Parish of Norton better Farming Association. Motto, "Each for all, all for each." Pres., J. Raymond; 1st vice, W. Whitmore; 2nd vice, James Allaby; secretary-treasurer, Roy Raymond. Farm selected owned by John Raymond. At Corn Hill, King's County, the Corn Hill Better Farming Association was formed. Pres., Naaman Hughson; 1st vice, J. H. Branscomb; 2nd vice, John Keith; secretary-treasurer, F. H. Rous. Farm selected, John Keith's.

At Clarence Centre, Annapolis County, N. S., the Annapolis County Better Farming Association was formed. Pres., E. Marshall; 1st vice, C. H. Jackson; 2nd vice, S. B. Marshall; secretary-treasurer, F. W. Ward. Farm selected, V. B. Leonard's. In Antigonish County, N. S., the Antigonish Better Farming Association was formed. Pres., Rev. Dr. McPherson; 1st vice, George Taylor; 2nd vice, James Thompson; secretary-treasurer, Alex. McDonald. Farm selected, Taylor Bros. At River John, Pictou County, N. S., a Better Farming Association was formed. Motto, "Progress." Pres., Colin Langwell; 1st vice C. A. Hamilton; 2nd vice, D. K. McLean; secretary-treasurer, G. McLeod. Farm selected H. M. Tatterie's.

Spraying Mixtures.

Quite a number who have used Lime-Sulphur and Arsenate of Lead for spraying their fruit trees, and have found it much better than the poisoned Bordeaux, have written the Department to know if it is equally effective for spraying potatoes.

Potatoes are sprayed for two reasons, viz; to protect them from the Blight and to kill the Potato Beetles more commonly called potato bugs. The Bordeaux mixture and the Lime Sulphur wash are the two fungicides commonly used for the former and Paris Green and Arsenate of Lead the two insecticides for the latter.

The results of all experiments that the writer has been able to find, shows conclusively that the Bordeaux Mixture is better for potatoes than the Lime Sulphur wash and it is at the same time cheaper for spraying of fruit trees however the Lime Sulphur wash is much to be preferred.

There is not the same unanimity of opinion reagrding the poison to be used with the Bordeaux. W. T. Macoun in Bulletin No. 49, on the Potato and its Culture says: Arsenate of Lead adheres better to the foliage than Paris Green and its use is recommended on this account, but as it does not appear to kill as rapidly as Paris Green, a mixture of 8 ounces Paris Green and 1½ lbs. Arsenate of Lead to 40 gallons of water is suggested. In the Report of the Experimental Farms for 1911, pages 131 he reiterates the same statements only is a little more favorable to Arsenate of Lead if only one is used. He says however, 3 lbs. are necessary. On page 132 he gives in detail the experiments from which his conclusions are drawn.

On page 6 of Bulletin No. 82, Part 1, of the Bureau of Entomology of the U. S. Department of Agriculture a summary of experiments is given which shows that Arsenate of Lead and Bordeaux mixture when applied at the rate of 6 lbs. to 50 gallons was much better than any other poison applied at any rates.

The spray calendar of the Oklahoma Experimental Station gives Arsenate of Lead as the poison for the Bordeaux mixture for Potatoes.

The United States Department of Agriculture in circular No. 87 on the Colorada Potato Beetle, page 14 says: "Arsenate of Lead serves the same purpose as Paris Green and for use against the Colorada Potato Beetle is still more valuable.

From all of the above it would seem that Arsenate of Lead is quite as good as Paris Green to use with the Bordeaux mixture for killing Potato Bugs and Macoun's suggestion seems to be a good one, to use some of both. The Paris Green kills more quickly but the Arsenate of Lead sticks on much better.

3 lbs. Arsenate of Lead or 1¼ lbs. Paris Green should be used to 40 gallons of water. Potato vines are not injured even if much more Arsenate of Lead is used to 40 gallons. Arsenateof Lead can be purchased now at $10.00 per hundred lbs. so that it is almost as cheap as Paris Green.

Theodore Ross.
Secretary of Agriculture, P. E. I.

Simple Way to Test Acid Soil.

Those who use lime have found litmus paper useful in determining whether the soil is acid or sour, and, therefore, in need of lime. But there is often some uncertainty as to the result, because when used in the usual manner of placing the paper in a sample of soil and pressing the soil particles against it, the paper would often be so much stained by the soil that it would be difficult to tell whether it had turned red or not.

At a recent farmer's institute Mr. Blair of the New Jersey experiment station showed a better method. A piece of blue litmus paper was placed in the bottom of a glass, then covered with white filter paper. The soil to be tested was placed above this and a small quantity of pure water poured over it. The soil used in this case was known to be acid or sour, and the water carried a portion of the acid through the filter paper and turned the litmus paper red, as could easily be se?n through the bottom of the glass vessel. The filter paper kept the soil from coming in direct contact with the litmus paper, and there was no staining. Soil not sour, and, therefore, not in need of lime, treated the same way does not turn the blue paper from its original color. Both filter paper and litmus paper can be secured for a few cents at drug stores.

Cut Worms and Army Worms.

Two species of caterpillar, the cut worm and the army worm, have been considered by the officials of the Experimental Farms to be of sufficient interest to the crop growers in Canada to warrant a preparation of a bulletin on them for public distribution. These two common enemies of crops are credited with causing every year damage amounting to a large sum of money, reaching in some seasons hundreds of thousands of dollars. They are both night feeders and are most destructive early in the season when vegetation is tender and, therefore, easily eaten off. Clean cultivation and the encouragement of birds are recommended as factors in the control of cut worms. The distribution of poisoned bran and fresh clover is also advised where practical whenever the worms are detected. To check the progress of army-worms on march furrows with holes dug at intervals are said to be effective. This illustrated bulletin of 29 pages No. 3 of the Division of Entomology and No. 70 of the Experimental Farms, was prepared at the request of the Dominion Entomologist by his Chief Assistant, Mr. Arthur Gibson. It is published by direction of the Hon. Martin Burrell, Minister of Agriculture. Copies may be obtained by applying to the Publications Branch, Department of Agriculture, Ottawa.

Bloody Milk.

I have a three-year-old heifer that has had her second calf that gives bloody milk from one quarter and do not know of any way she could have hurt it. It does not seem sore or swollen. Can you giv? me the cause and remedy.

Rupture of small blood vessels from bruising or rough milking or undue congestion causes bloody milk in heifers or it may follow an attack of garget. Remove possible causes. Bathe the quarter with cold water 3 times a day. If she is not in calf give one dram of dried sulphate of iron and two of salt in feed every night until milk is normal.

Lousy Hogs.

Some hogs which I recently purchased are lousy. What can I do to kill the lice? The hogs are in good condition.

Answer—(1) In the winter hogs can be sprayed on bright days with any of the coal tar dips used according to directions; this will kill the lice only and must be repeated in a week to get the nits which have hatched. Crude oil-soaked gunny-sacks nailed on posts for the hogs to rub against is a good preventive. In summer hogs may be dipped in on? of the commercial dips.

At the great Ormstown Stock Sale McIntyre Bros. Sussex, N. B. bought the imported Ayrshire cow Monkland Snowdrop 4th. Messrs McIntyre recently sustained the loss of their famous show and producing cow White Lady, champion at many Maritime Province shows during the past few years. White Lady died on May 1st. and Monkland Snowdrop has been purchased at a fancy figure to fill the gap in their aged show class. May she prove so successful in winning the red ribbons as her predecessor.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

JUNE 25, 1912.

DATES OF ISSUE.

July ..... 9—23
August 13-27

Look at a proposition to see how you can use it—not how you can get along without it.

If you are doing business in the Maritime Provinces you cannot afford to do without an advertisement in the Maritime Farmer.

The most successfnl business man is the one who asks to be shown "why" he should do a thing and then does it-

A FARMER'S CREED FOR THE DAY.

For this day I will do my best to do everything just right; to be good and kind to every living thing I have anything to do with; to be thankful that I live in such a good world; to make that world a little bit better; to think some new thought; to read a page or two from some good book; to look up from my work long enough to see what my neighbor is doing and tell him I am glad he is doing so well; to strike some blow for the right; to get a little nearer to the heart of my wife and children; and to ask God to help me make to-morrow a better day, a much better day, than this has been.

GROW YOUR OWN SEEDS.

Despite the countless warnings that have been sent out by the Federal and Local Departments of Agriculture throngh the press and by speakers on the public platform, re the danger of incurring loss through the sowing of seeds that have not been given a thorough germination test, a great many farmers who sowed western grown oats this spring are now face to face with the stern reality. The oats have failed to germinate. This trouble is accounted for by the fact that a great deal of western oats were froz- last fall to such an extent that the growth germs were killed.

On another page of this issue Prof. M. Cummings gives some timely advise as to the best methods to pursue. He strongly urges farmers to grow their own seeds. Now is the time to plan the garnering of your best plots when the harvest time comes. Why not do a little work in the line of seed selection this year. It will not take much of your time. The time it does take will be well spent and you will be amply rewarded.

ADVERTISING PURE BRED BULLS.

All breeders should realize that the big market for surplus bulls is among the dairy farmers. These farmers offer a much larger field for selling bulls than breeders. Moreover the purchase of a pure bred bull is a stepping stone to the breeding of pure bred cattle. Here is what Malcolm H. Gardner says:

To make money from the sales of stock, a market must be found for the breeders' surplus and that market must be found largely among outsiders. Confine any class of breeders to sales among themselves, and the business as a business will be strangled in short order. Hence the need of advertising-- the need of letting the outsider know that you can benefit him and yourself at the same time.

THE STANDING CROP COMPETITION.

The secretaries of the various agricultural associations in the Matirime Provinces that are conducting crop competitions have sent out their circulars to their various members. A certain date is set for closing the entries. The various secretaries must notify their Department for agriculture at as early a date as possible after the entries close so that arrangements can be made to have competent judges visit the various fields before the crops are harvested. Owing to excessive rains a great many would-be-contestants did not get their grain and roots seeded as early as they would wish and may be a litlle dubious about making their entries. The trifling entry fees will not make nor break your fortunes, and by the time the judging season comes around crops that are not very promising at present may outclass your highest expectations. Give yonr association a fair show by making your entries early. It will help to carry out the competition in a business like way. Do your part the officers of your association will de theirs'.

PROF. ARCHIBALD GOES TO OTTAWA.

Our Maritime Province farmers will regret to hear that Prof. E. S. Archibald of the Nova Scotia Agricultural College has severed his connection with that institution. They will however, be glad to know that his services will not be all together lost to the Maritime Provinces. In his new position at the Central Experimental Farm, Ottawa, he will be able to do a lot of good work for the Maritime Provinces. During the few short years that Prof. Archibald has been engaged in Agricultural work at the Truro College he has displayed so much enthusiasm in his work that he has gained the confidence of the farming population not only of Nova Scotia but of Prince Edward Island and New Brunswick as well. We are sorry to see him go away for he was the right man in the right place, We are confident that each and every one of our readers join with us in wishing Prof. Archibald every success in his new position and trust he will find it convenient to frequently visit the Maritime Provinces where he will always be accorded a hearty welcome.

THE FARMER MORE IMPORTANT THAN THE FARM.

Of the two main factors in agriculture, the farmer is more important than the farm. Some men will succeed almost anywhere and under most adverse circumstances, Aggressive, persistent, close-calculating and energetic they could accumulate fortunes where other men would starve. On farms of stubborn sterile, hilly clay, they produce crops and incomes which rival results on black mellow prairie farms. Where conditions are propitious, such men set the pace for the nation in agricultural production and prosperity.

HANDS ACROSS THE SEA.

A group of distinguished British capitalists and merchants, under the leadership of Mr Leonard Palmer who toured Canada last year as special representative of the London Financial News, are now in Canada, They have completed their tour of inspection of the various centres of industrial activity in the Maritime Provinces. They have only touched the fringe of our great Canada but what they saw in the Provinces by the Sea,—magnificent situations, execllent harbors and a contented, busy class of people very favorably impressed the visitors. They realized that all that was necessary to make tne Maritime Provinces the best country under the sun was more capital and more people. A hearty welcome was accorded the delegates at every point that they visited. The favorable impressions gained of the vast industrial possibilities of the Maritime Provinces will eventually result in the extention of more British capital to our industries and in bringing our advantages to the attention of a good class of citizens, who, hearing of our possibilities may decide to cast their lot with us.

A party of school teachers from Scotland will visit Canada during July to inquire into Canadian Systems of education. They, too, will be heartily welcomed and on their return to their various schools they cannot help doing a lot of good advertising for Canada.

HOW ABOUT POTATO SPRAYING.

How about your potato fields? Are you going to Spray in order to ward off The Blight and Potato Bugs or are you going to let them run rampart and take a great share of the profit out of your year,s hard work? A couple of thorough sprayings with some good fungicide and insecticide will keep the vines in a healthy, thrifty condition untill they become frosted. The result will be a prolonged period of growth for the tubers and a consequently increased yield. An increased yield means a greater return for your labors—a more profitable season's work. The leaves of the plant constitute the plant's stomach Impair an animal's stomach and the animal soon becomes stunted and unthrifty. If you allow blight and bugs to impair the leaves of the potato vines the tubers will become stunted. The expense incurred in spraying your potato vines is very insignificant in comparison with the extra amount you will realize from harvesting a healthy bountiful crop. Because you have never sprayed before is no reason why you should not spray this year. Ask your neighbors who may have sprayed their potatoes in previous years for their experiences. We will abide by their decision.

CHASTENING GREVIOUS YET JOYOUS.

At Geneva, New York, the authorities classified all dairies as "poor", where conditions were filthy; "medium", which meant dirty, merely; "good", which is Genevese for fairly clean; and "excellent", where they were really clean and actually sanitary. This classification was made public, and milk was bought and sold at prices graded according to it. At the beginning more than a third of the dairies were "poor", more than half only "medium", and only one in twenty was „good". There does'nt seem to have been any "excellent". At the end of a year of this publicity, more than half had so far cleaned up as to be "good" and the "medium„ had fallen to 38·2 per cent. By the end of a second year, eight out of every ten were "good", and about one in ten "excellent". At the end of the first quarter of the fourth year, one dairy in every eight was "excelleut",-- that is capable of producing absolutely sanitary milk. The "poor" and „medium" had all been wiped out, and all which were not "excellent" were „good". We don't like to be shown up, do we? But is'nt it good for us?

Experimental Farms Appointments.

The increasing volume of work connected with live stock, field husbandry and forage crop production on the Dominion Experimental Farms has renderered necessary the division of the duties heretofore undertaken by the Dominion Agriculturist. The increase in the work devolving upon the officer holding that position is due partly to the ever-growing number of Experimental Farms, with the consequent heavier task of supervising much of the experimental work on each, and also to the number of lines of investigation now being taken up, which, in many cases, are new and, in others, are being studied in a more scientific way and in greater detail than before. Among these may be mentioned problems in connection with the keeping of live stock and dairying, the study of the effect of rotations, both as to the value of the crops harvested and the result of each rotation on the fertility of the soil. Cultural methods are also being tested in a most systematic manner on all the Experimental Farms, with the same ends in view, to ascertain the value of each in terms of crop produced, taking into account, at the same time, the effect on fertility. Beside the above lines, a special effort is to be made to improve

Prof. E. S. Archibald.

The Newly Appointed Dominion Animal Husbandman.

the quality and yield of our grasses, clovers, alfalfas, roots and other forage crops. A new feature of the work will be the endeavor to collate the mass of data so gathered on the various farms and from it draw some conclusions which, it is hoped, will prove of great value to the Canadian farmer.

It will be easily seen that, to carry out the work here briefly mentioned, involves a vast amount of most careful experimenting and recording of results obtained, a work bejond the powers of any one officer to carry on successfully. The Dominion Department of Agriculture is to be congratulated on having obtained the services of the gentlemen whose careers are herein noted, to fill the positions thus rendered necessary.

Three appointments have been made, a Dominion Agrostologist, a Dominion Animal Husbandman and an Assistant Dominion Field Husbandman.

In addition to assuming some of the duties formerly discharged by the Dominion Agriculturist, the Dominion Agrostologist, Dr. O. M. Malte, takes up some of the work previously supervised by the Dominion Cerealist Dr. G. E. Saunders, and by the Dominion Botanist, Mr. T. H. Gussow. He will devote his time more especially to the breeding and improvement of Canadian forage crops of all kinds, paying special attention to grasses, clovers and alfalfas.

Dr. Malte was born on March 8th. 1880 in Southern Sweden, where his father was a merchant. After attending prepararory and high school for about eleven years, he matriculated when 19 years of age at the University of Lund in Southern Sweden, graduating as Bachelor of Science and later taking the degrees of licentiate of Science (corresponding to Master of Arts) and Doctor of Philosophy. During the greater part of the time spent at the University, he was Assistant at the Botanical Gardens connected therewith. During the summer vacations he was for three consecutive years Assistant at the Experimental Station at Svalof, being engaged in breeding forage plants. As a permanent appointment at that Station was at the time impossible for financial reasons he became a teacher of natural science, including botany, zoology, chemistry, physics, geology, and astronomy, holding this position unti 1910, when he came to Canada. He has published several scientific papers on systematic botany, plant physiology, morphology, cytology and plant breeding.

The Dominion Animal Husbandman, Mr. E. S. Archibald, B. A., B. S. A. was born in Yarmouth, Nova Scotia, in 1885. His father Mr.E. E. Archibald was engaged in lumbering as well as in general Agriculture and fruit growing in that district until 1898 when he removed to Wolfeville, N. S., where he has since been interested in farming and orcharding.

The subject of the present sketch entered the high school at Wolfeville in 1898, matriculating in 1901. He received his Bachelor's degree from Acadia University in 1905, and his Diploma from the Nova Scotia Horticultural School, Wolfeville, in 1904. His practical experience, up to this time, included both horticulture and general agriculture.

The years 1905 and 1906 were spent at Truro where he worked on the College Farm and received the first graduation Diploma issued by the institution. After a visit to Wyoming, where he was sent in charge of a shipment of breeding stock, he entered the third year class at Guelph, Ontario, in the autumn of 1906 and graduated in 1908, being engaged during the summer of the year of his course, in getting practical experience on the farms of well known breeders of live stock.

After graduating in 1908, he accepted the position of instructor in Agriculture and Experimentalist at the Nova Scotia Agricultural College at Truro, and he was appointed Professor of Agriculture and Farm Superintendent at that Institution in 1910, resigning the position to take that of Dominion Animal Husbandmnn.

The work of supervising the Field Husbandry at the various Experimental Farms and Stations will be carried on by Mr. O. C. White, B. S. A. who has for some time been Assistant to the Dominion Agriculturist. Mr. White will not however, assume the title of Dominion Field Husbandman, but will be known as Assistant Dominion Field Husbandman, Mr. J. H. Grisdale, B. Agr. Director of Experimental Farms continuing as Act ing Dominion Field Husbandman, for the present.

Mr. O. C. White was born September 14th. 1887 at Ashburn Ontario County, Ont., where his father was farmer. He received his primary education at the Ashburn Public School and in 1901 took the junior leaving examinations from the Uxbridge High School.

After four years on the farm at Ashburn, he spent a season on a grain farm in southern Manitoba and a few months on a mixed live stock farm in the State of Pennsylvania.

He entered the Ontario Agricultural College in the fall of 1906 graduating from that institution in June 1910, his work there covering both live stock and Field Cultural work. During this period two summers were spent under Prof. W. H. Day as a drainage surveyor and demonstrator. During his final year Mr. White formed one of the Ontario Agricultural College Stock Judging Team at the Chicago International.

His former position of Assistant to the Dominion Agriculturist was assumed immediately after his graduation in June 1910 and he has continued to occupy it until his present promotion.

Failure of Oats to Germinate in Nova Scotia.

A large number of farmers in Nova Scotia are reporting a failure of their seed oats to germinate, and it is evident that a large loss will be entailed. So far as ascertained by the Department of Agriculture, the failure is confined entirely to fields seeded with Western oats, which were severely frosted last year. Those fields that were seeded with home-grown, or in fact, any Maritime Province grown oats, are reported to be germinating excellently and give promise of a good crop. The Seed Division of the Department of Agriculture, Ottawa, has repeatedly warned farmers through the press and on the platform of this very danger which they incur through using Western-grown oats, as well as the danger of importing weed seeds. The Department has strongly urged the farmers to grow their own seed or to buy seed that has been grown as near home as possible. It was with this very aim in view that the Nova Scotia Department of Agriculture inaugurated, three years ago, standing field crop competitions, which were intended to encourage farmers to grow their own seed.

The strange feature about frosted oats, is that the kernels can be frozen so badly as to destroy the germ and yet appear bright and of good quality. In this respect oats differs from wheat, the kernels of which are in the first place not so easily destroyed by frost, and in the second place shrivel up so much that their frozen condition is easily recognized. Mr. Moore, of the Seed Division of the Department of Agriculture, Ottawa, says that one can easily recognize frozen oats that will not germinate, by splitting the kernel lengthwise, when the germ will appear quite dark in color instead of white as it should appear in a normal kernel.

What are the farmers to do this year? It almost looks as if the farmers whose land is seeded down to expensive timothy and clover seed, had better leave their fields alone and be satisfied with the extra stand of clover and timothy. The farmer who has not seeded his land has no alternative but to plow or harrow the field and put in a crop of buckwheat or green feed such as peas and oats and possibly in some cases, oats alone, although, at this late date, they will have difficulty in getting good seed.

The lesson for future years is easy to perceive. Maritime Province farmers should take the advice of both the local and federal Departments of Agriculture and grow their own seed.

In this connection, following the big prices which have been paid for timothy seed, it is to be hoped that many farmers will grow at least sufficient timothy seed for their own use. In former years many farmers did grow their own seed, but cheap imported seed led to their giving up the practice. However, it looks as if the days of cheap timothy seed were over, and that farmers should protect themselves by growing at least enough for their own use. Only one word of warning which should apply whether farmers are growing seed for their own use or to sell, but more especially in the latter. It is illegal to sell timothy or red clover seed that contains more than eighty (80) noxious weed seeds to the ounce. (There are approximately 80,0000 of timothy seeds in an ounce). The most troublesome weeds which are likely to appear are Ox-Eye Daisy and Canada Thistle, which should preferably, when they appear, be cut in the field before the timothy has headed out. In other words, clean the field and there will be no need to clean the seed.—Prof. M. Cumming, Truro, N. S.

The Breeding and Feeding of Dairy Cattle.

Editor Maritime Farmer:—

"The Breeding and Feeding of Dairy Cattle" really involves two subjects but they are so closely related that one cannot be taken up without bringing the other in also. In regard to breeding, the first and all important principle to remember is, to breed to nothing but a pure-bred bull, and further than that breed only to a pure-bred bull, the production of whose dam, and the yearly net profit she makes is known to be above the average.

But such bulls cost money and are hard to get, and just here, I think, there is room for co-operation. Dairymen should get together and buy a bull on shares; then they could purchase a high class bull, thus obtaining his services, with a very small outlay. If two such clubs would take up the same breed, they could interchange their bulls, and still further reduce the cost of obtaining the services of a first class sire. On no condition should a change be made from a bull of one breed to that of another. Choose a breed at the outset, and stay by it through thick and thin.

In buying a bull his show-ring records and those of his sire and dam must not be the only things taken into consideration.

Dairymen are not breeding for the show-ring but for the production of milk, therefore, a dairyman's bull must show production in his pedigree as well as good breeding. Breeders of pure-bred stock are finding this out and there are many who can supply bulls, the yearly production of whose dam can be shown. When the service of a first-class bull is procured; the crop of heifer calves he produces must receive special attention so that they may come to their first calf, if not beef fat, at least in good condition. But great care must be taken not to over-feed during the winter season, and to give plenty of outdoor exercise, insuring a strong healthy cow. It is not advisable to breed heifers to calve any earlier than thirty months old. Give them time to develop and a stronger better producing cow will be the result.

This short outline of breeding dairy stock, touches only the outside of the subject. It is a science in itself and must be given much careful study. The feeding of the dairy cow is, if anything, of more importance than breeding.

A dairyman may feed well and realize some profit without paying much attention to breeding. But he is not making as large a profit as the man who breeds as well as feeds. In the matter of feeding there are a few standard feeds, which must be fed to get the best results. These are roots, clover, hay, oats, bran, oilcake and cottonseed meal. I am speaking now of winter feeding. Avoid prepared dairy feeds, they are generally adulterated. Roots are the best succulent feed for this Province as they can be grown more successfully and more profitably than ensilage corn. Anyone can grow a crop of turnips. And by feeding after each milking no bad flavored product results.

(Continued on page 663)

HORTICULTURE.

Combating the Cutworm.

Tomatoes, cabbage, and other vegetables and garden plants, and especially those which are started under glass and transplanted, are subject to serious injury by cut-worms They appear sometimes in great numbers in spring and early summer and frequently do severe injury before their ravages are noticed. The method of attack is to cut off young plants at about the surface of the ground, and as these insect are of large size and voracious feeders they are capable of destroying many plants in a single night, frequently more than they could devour.

The usual method of control is by the use of poisoned baits. Take a bushel of dry bran, add 1 pound of arsenic or Paris green, and mix it thoroughly into a mash with 8 gallons of water, in which has been stirred half a gallon of sorghum, or other cheap molasses. After the mash has stood several hours, scatter it in lumps of about the size of a marble over the fields where injury is beginning to appear and about the basis of the plants set out. Apply late in the day so as to place the poison about the plants over night, which is the time when the cutworms are active. Apply a second time if necessary.

When cutworms occur in unusual abundance, which happens locally and sometimes generally in some seasons, they exhaust their food supply and are driven to migrate to other fields. This they do, literally in armies, assuming what is called the armyworm habit. At such times it is necessary to treat them as we do army worms whi,e the methods which have been advised are valuable in such cases, these remedies may be too slow to destroy all the cutworms and we have to employ other methods. Clean culture and rotation of crops are advisable also fall plowing and discing.

Protect the Nozzle.

A great many men treat their nozzles something like this: A spray nozzle should give a fine spray with the same disk used all last season; it should never need new disks; never need new packing; it never needs cleaning, but should do perfect work, even though stopped up with leaves, twigs, straw and other things that got in because the top of the tank wasn't covered, or that would have been caught by the strainer, only the strainer had a hole punched in it last winter and wasn't mended yet.

Don't expect a neglected nozzle to do good work. It can't. It should be washed out with clean water every night. The best way to do this is to pull the suction hose out of the tank, stick it in clean water, and then run the pump until clean water comes through the nozzle.

A spray nozzle should have a disk with asmall hole, if a fine spray at reasonable pressure is expected. Disks will wear out. Have plenty of extra ones and use them. Keep the tank clean and strain the solutions into it. It is easier to keep sediment and trash out of the tank than to pick it out of the nozzlesi

The nozzle is the business end of the whole outfit. For it we have engine, pump and hose. It determines the pressure to be carried and the pressure determines the size of the engine, the grade of the hose, the wear of the disks. High pressures are responsible for a good many of the troubles of the spraying. Are nozzles now available giving good sprays as at low pressures as they should?

Thewhirling spray nozzle attains its results by using centrifugal force to send the liquid into the air in a thin, conical sheet, when the resistance of the air tears this thin sheet into a fine mist. This nozzle gives little or no spray in the centre of the cone. Attempts are being made to put a center into the cone, the general plan adopted being to interfere with the smooth whirling liquid inside the nozzle, churn it into a froth, and blow it by main strength sputtering into the air.

The throat passage is put there to direct a jet into the eddy chamber. There is needless loss of pressure in getting the liquid into this passage if the edges of the opening are not rounded.

The jet should be smoothly turned so it will be directed into the eddy chamber in the direction in which the liquid must whirl. Pressure is lost in throat passages with sharp turns. The shape of the jet after leaving the throat passage must be rectangular, in order to fit into the spiral in which the liquid whirls.

Now suppose there are two throat openings into the eddy chamber, and that this chamber is a true circle in side. What becomes of the stream shot in from the throat? It follows the outside of the eddy chamber, of course, until it comes to the second throat opening, and there if the opening is not protected in some way it strikes squarely into the stream coming out at that point. Result? Eddy and froth, stoppage of the whirl and loss of more pressure. The same thing is going on at the other side of the nozzle.

To sum up the points I wish eo emphasize as essential to the design of a successful low pressure nozzle are: 1, Easy entry into the throat passages; 2, gradual turning of the stream in these passages toward the eddy chamber; 3, a rectangular stream; 4, spiral sides to eddy chamber. Lastly, no nozzle will do good work unless treated right.—Prof. H. W. Riley, N. Y. Col,ege of Agriculture.

Farm Too Family Fresh.

The following extract taken from the column of the Long Island Agronomist, the Agricultural organ of the Long Island Railway Experimental Farms in the "Home Hamper," contains some suggestions that are well worth passing along to our market gardening readers:

"The market success of the Home Hamper which was originated and put in service soon after the first crops came in on the Long Island Railroad Experimental Station No.1, is our reason for giving the following details which answer innumerable inquiries from both producers and consumers. In the past year quite a number of producers have decided upon this method of disposing of their entire output, and many who have not yet adopted this system are planning to do so. The Long Island Home Hamper, a "Farm to Family Fresh" method, solved a problem of vital interest to both producer and consumer. The Home Hamper is a light carrier measuring 24 inches long, 14 inches wide, 10 inches deep, weighing packed about 35 pounds. It contains six baskets, holding about one half peck each, and filled with from seven to twelve varieties of vegetables, berries and friut in season. Each basket is carefully packed and lined with green wax paper, which not only adds much to the appearance of the package, but also serves to keep the contents crisp and fresh.

The Hampers are packed in the morning, shipped at seven o'clock and delivered in Greater New York about noon. Our charges are $1.50 delivered to the consumer's door, within delivery zone of the Long Island Express. To duplicate contents on the open market would cost from $2 to $4, therefore the consumer always gets his money's worth of fresh, crisp, palatable table delicies. The average family uses two Hampers a week, hence we have established Tuesdays and Fridays as regular shipping days. Many of our customers send in their checks to cover shipments for one or two months in advance, some for even more. All orders are accompanied by checks, no open accounts being kept.

The Home Hamper has been shipped to Michigan, to Chicago, into New England, the Southern States and to France. Reports of these distant shipments have invariable come back: "Hamper received with contents in perfect condition." To satisfy customers is a pleasure; to realize a just and fair profit is business; to pass along a "good thing" is our custom."

Apples.

"Climatic influences last year caused most of the apples by December to show a spent or over-ripe condition, similar to what is expected in normal seasons about the first of March, the result being that before Christmas, when prices generally stiffen, the Liverpool market sagged off fully two shillings per barrel on apples which had been held in ordinary warehouses. Apples, however, which had been carefully selected and kept in cold storage stood up well, were of fine appearance and were crisp and juicy. This well selected fruit, which had been held in cold storage, was in keen demand by the best class of buyers, and realized good prices throughout the seasan.

"Immense quantities of small lots of mixed varieties are still exported from Canada. These small mixed lots hurt the general tone of the market, as important buyers will not give them their attention, the result often being a dull dragging market with declining prices.

"The export of selected apples, properly packed in boxes containing about 40lb. net of fruit, should be encouraged, as there is a growing demand for the box package, if supplied at a reasonable price to the consumer.

"Prizes are now offered at British fruit shows for apples packedin such barrels and boxes, properly graded and packed, and during the past season apples from Kent, well graded and packed neatly in boxes, were, on the same market in Liverpool, quickly cleared at high prices when competing against Canadian and United States apples packed in barrels. —Extracts from the yearly report of A. W. Grinley, Liverpool, England, Chief Cargo Inspector in Great Britain for the Canadian Department of Agriculture.

Warning to Potato Growers.

In regard to the comparative values of Bordeaux mixture and lime-sulphur for the spraying of potatoes, the following is of interest.

"After a careful test, made by the New York Experiment Station in 1911, it is concluded by the experimenters that lime-sulphur solution cannot replace Bordeaux mixture as preventive of potato diseases. The plants in rows sprayed with lime-sulphur were dwarfed by the fungi-40 bushels less to the acre, than plants in check rows; while the Bordeaux-sprayed rows produced 100 bushels to the acre more than the checks. Although the conditions were probably more suitable for the Bordeaux spray, still the experiment conclusively proves it unsafe to use lime-sulphur on potatoes."—Horticultural Division, Fredericton, N. B.

Prof. Saxby Blair Comes Back to Nova Scotia.

The many friends in Amherst and Nappan of Mr. Saxby Blair, formerly manager of the horticultural department of the Experimental Farm at Nappan, but of recent years connected with the McDonald Agricultural College, Quebec, will be glad to know that he has been appointed manager of the new horticultural farm at Kentville, and will have general supervision of horticultural work in the province. Mr. Blair will leave the McDonald School sometime before the end of the present month. His many old friends will be glad to welcome him back to Nova Scotia.

Dreadful Ravages of Orchard Tent Caterpillars.

The apple tent caterpillar is making dreadful ravages in many orchards in Eastern Canada. Those who did not watch out and spray for it at the right time will suffer serious loss. Many orchards are in the grip of this pest. The trees look blighted, some of them, many in fact, completely stripped of their leaves. These caterpillars, in their legions, have attacked not only orchards, but shade and other trees as well. The conditions could hardly be worse. Their large tent-like spider's web-like nests are so large that they can be seen in the branches at a distance. Some orchards seem to have been hopelessly abandoned to them, probably from the fact that their owners had not the necessary spraying apparatus. It is a pity, too, because the caterpillars can be easily cleared out by spraying. It will, however, serve the purpose of emphazing a lesson for future years, the absolute necessity of spraying and taking the ordinary precautions to prevent this and other pest ravages.

The apple tent caterpillar is so called by reason of the tent-like nest it builds for itself in the branches of the tree. Into these tents the dirty-looking brown masses congregate at night to renew their ravages in the day time and especially in warm weather. They swarm over the trees and eat up the leaves.

This plague of caterpillars is probably due to a deficiency of their natural checks or enemies, and this due to the peculiar conditions of an unusually wet season.

The eggs from which the caterpillars come are laid in masses on the bark of the tree by a moth in the fall. They are securely protected for the winter and are hatched out in the first warm weather in the summer. They then build their nests and commence their depradations. Their ravages, where unchecked, will continue for two or three weeks longer, when they will disappear into the ground, where they pupate and then emerge as the adult moth to recommence their egg-laying in the fall. This is the round of their life.

They can be exterminated by spraying with lime sulphur diluted one to 25 or 30 and arsenate of lead, 3 lbs. to 40 gallons of water. They are killed by eating this poison on the leaves.

Kerosene emulsion, a contact poison, will kill them in their nests by spraying. This emulsion is made as follows:

Formula:

Kerosene oil (coal oil) 2 gals; rain water, one gal.; soap, half a pound.

Boil the soap in water till all is dissolved; then, while boiling hot, turn it into the kerosene, and churn the mixture constantly and forcib,y with a syringe or force-pump for five minutes, when it will be a smooth creamy nature. If the emulsion is perfect it will adhere to the surface of glass without oiliness. As it cools it thickens into a jelly-like mass. This gives the stock emulsion, which must be diluted with nine times its measure of warm water before using on vegetation. The above quantity of 3 gallons of emulsion will make 30 gallons of wash.

The tent caterpillar can easily be disposed of also by going round the trees in the early morning, or towards evening and clearing out the webs with the enclosed colony of worms. During the warmer hours of the day caterpillars are scattered over the limbs of the tree, feeding upon the foliage, and, therefore, it is necessary to attack them when they are all at home in their tent. Some people burn them up in their tents at these same hours.

The Roofings That *Have* and *Will*

Some roofing claims are filled with "wills"—"They will last"—"They will not need repairs"—etc., etc. You hear a great deal about what the *old-time* shingles *have* done.

NEPONSET
PAROID ROOFING

DAIRYING.

A Visit to the Island ot Guernsey.

Editor Maritime Farmer.

The Channel Islands are among the oldest possessions of the British Empire, although from their geographical position one would naturally conclude that they belong to France. They lie in the English Channel much nearer the French coast than to any part of England.

Wishing to visit these Islands but to avoid the long crossing from England to Guernsey I tried to cross over from St. Malo on the coast of France. When I arrived at St. Malo I was informed that there was but one regular weekly steamship sailing during the winter months and I would have to wait two days for the first steamer. Realizing that time could be saved by crossing over to England and there take passage on one or other of the steamers sailing on alternate days from Weymouth and Southampton for the Islands of Guernsey and Jersey I returned to Paris, crossed the English Channel via Boulogne and Folkstone and went to London. Leaving London about Nine P. M. at Weymouth I went on board the steamer, and, after what I considered a good crossing we reached St. Peter Port, Guernsey, shortly after seven A. M. Judgment varies; returning a gentleman was telling me what a terrible crossing they had going over by the same steamer and on the night in question.

The Island of Guernsey is known to those of us who live on this side of the Atlantic as the original home of one of our most famous dairy breeds of cattle, but perhaps but few realize what a small place it really is. At its longest part it is but nine and a half miles; at its broadest seven miles. Including curves its coastline is thirty miles. The total area is given as 16005 acres. The soil is a "light sandy loam, with a sub-soil of angular gravel." The population is somewhat over 41,000, and every available inch of land seems to be under cultivation. Generally speaking the farms are small and becoming increasingly so due to subdivision Rents are high; the average for The rate of land for the growth of bulbs which are widely cultivated is from £10 to £12 per acre. The day previous to my visit a steamer having hold and decks loaded with nothing but flowers from these bulbs sailed for England. In addition to the land thus given over to the growth of flowers probably as large an amount is under glass. In these glass houses figs, potatoes, tomatoes etc., are grown for the English markets.

The object af my visit was to see and study the Guernsey cow in her natural home, so I got right away out from the town and having a rig was able to visit many different herds. I was extremely fortunate in having as a companion a prominent American Guernsey breeder and importer. He had frequently been over the Island purchasing cattle and had just completed selecting over one hundred head to ship during March to the United States. Herds belonging to the best cattle breeders were visited, and also others of lesser repute. The best animals of the Guernsey breed were thus seen and handled, and by the way, there are no animals of any other breed allowed on the Island and has not been for almost one hundred years.

To attempt to describe in detail any one of the herds seen or even any individual would be quite beyond the scope of what I set out to do. I shall attempt to write only in general terms regarding what I saw and the impressions which I formed. None of the herds were what would on this continent be considered large. I probably only saw three herds in which the number of animals, young and old, would exceed twenty. I do not remember ever having seen a prettier sight than two of the largest herds tethered out to graze in two adjoining fields. All cattle are tethered when out grazing in the Channel Islands. I saw in various stables and out in the fields individuals, male and female, who were veritable beauties. Along with this beauty in the cows there was combined to a very high degree, milk and butter producing qualities, Some of these animals could not be purchased at any price. The farmers realize that if the quality of their stock is to improve, they cannot afford to allow their best animals to leave the Island. At the Cattle Shows first prizes awarded in each class are not given to the owners until the winners have been subsequently kept on the

sequently kept for a year on the Island. That many cows are bred annually to the best bulls is quite

Hear What Others Say About It

Following are some extracts taken from letters received from owners of Standard cream separators. They show what others think of the Standard :

Standard

"It's skimming by our repeated tests is perfect"—"Your claim 'The World's Greatest Separator' I thought at one time rather far-stretched and sweeping. I now believe it justifiable."—"I think it is the easiest machine I ever turned and very easily washed, and I don't there is a separator that can skim as clean taking it all round."—"Am pleased to tell you that the last test was 0.01"—"No back straining to put in the milk and no dirty oiled smeared around the machine all the time"—"It has the best oiling device I have ever seen"—"I find it a very close skimmer with the milk in any condition and that it will deliver any density of cream with either warm or cold milk, and still flush out easily."

The letters from which the above extracts are taken, are printed in full in our booklet. Send for a copy. It is interesting, instructive, and fully describes the "World's Greatest Separator," the Standard.

Cream Separator Facts Worth Knowing

THERE are *six* important things a cream separator should do in order to be a paying investment.

FIRST: It should get *all* the cream.
SECOND: It should get the cream in *perfect condition.*
THIRD: It should *save* you money.
FOURTH: It should *save* you work.
FIFTH: It should be *durable.*
SIXTH: It should *make money* for you.

There are a host of machines that are claimed to do these six things. But Empire separators are the only separators actually doing the whole six. That's certainly a bold statement. It's the truth, nevertheless.

FIRST: Empire Cream Separators skim to .02 per cent. and often less. That means the loss of only one pound of butter fat in every five thousand pounds of milk, which is equal to the loss of one pound of butter fat in all the milk a cow gives in one year. The Frictionless Empire *gets all the cream*

EMPIRE

Cream Separators

SECOND: The few smooth-skimming devices of Empire separators are as easily and thoroughly washed as glass tumblers. This cannot truthfully be said of skimming devices with corners, sloths and crevices that soon get clogged up and cannot be thoroughly cleaned. *Cream in perfect condition* —cream without a taint—can only be obtained from a separator that can be thoroughly cleaned.

THIRD: Empire separators get thirty per cent. more cream than old style methods. *The more cream saved the more money saved.*
FOURTH: Empire separators do the skimming in a fraction of the time required with old style methods. *They save many hours of work.*
FIFTH: You can judge the durability of Empire separators when we tell you that the average cost per machine has been less than thirty cents a year for repairs during ten to fifteen years of service.

Empire Disc.

SIXTH: Empire Cream Separators get thirty per cent. more cream than old methods. The cream is first quality—commands a higher price than gravity cream. More cream and higher price cream necessarily mean *more money.* The Empire will give you enough more profit than a cheap separator to pay for itself in two years. No other separators will fulfil all these six requirements. They cannot do so, because they cannot use the Empire patented devices and mechanism.

These patented features are found only in the Frictionless Empire (cone method) and Empire Disc. Whichever you choose, you are bound to be satisfied. Every Empire Separator is sold under a binding guarantee —*a guarantee as good as a gold bond.*

Write for a copy of our latest catalog. It describes both machines completely and is handsomely illustrated.

AGENTS EVERYWHERE IN CANADA—LOOK FOR THE EMPIRE SIGN. 35

WINDSOR DAIRY SALT

Is The Cheapest You Can Use

not alone, because it is the purest and best salt for salting butter. But because **it will salt more butter, pound for pound, than any other salt you can use.**

The big creameries will tell you this—and show you **tests** to prove it.

The Agricultural Colleges demonstrate this every day.

Every farmer and dairyman—who is getting good prices for butter—is using Windsor Dairy Salt.

It is pure—it makes beautiful butter—it works in quickly—and it is the cheapest in the end. Just try it yourself.

70D

evident. A visit was made to the home of "Governor of the Chene" once champion and yet one of the best bulls on the Island. He is now twelve years old but last year at the show, in spite of his age, stood second in the class for bulls over twenty-seven months. Over 4,000 cows have been bred to him. Another, a young bull, out of a very famous cow, last year brought in over £60 in service fees to his owner.

I was struck with the variation in type of the animals on different farms in the hands of the various breeders. Some have kept most prominently before them the production of an animal beautiful in form but in their efforts have sacrificed considerable in size. Others again have held size to be the most important feature and have succeeded in producing a very much larger but rougher animal, cows which will produce steers capable of dressing 1,000 lbs. of beef. between these two extremes there are various gradations and crosses. Milk producing qualities are held to be of the greatest importance. At the cattle shows the dam of any bull exhibited if on the Island, has to be shown at the same time. The dam of a bull having been tested a certificate of such test is taken into consideration by the jddges in awarding prizes. It may seem strange but nevertheless is a fact that there are practically no official records of milk production in existence in Guernsey. The longevity and prolificacy of some cows was very noticeable. I saw a cow twenty years old and she was in calf at the time. Another nineteen years old had given fifteen calves. I was told of a cow twenty-three years old and had given twenty calves.

The housing of cattle in Guernsey is not nearly as important a matter as it is to us in Canada. Cattle are kept in at night during cold, wet weather, but are put out to graze for at least a part of almost every day during the year. Some of the stables are quite modern and in every respect up to date, others are old, dark and very badly ventilated. Some of the cattle are groomed daily and have their tails and flanks washed. When in full milk, the best cows are milked thrice daily. The most progressive dairymen lay in a supply of hay and roots for winter feeding and purchase in addition bran and other mill products. Numbers are now beginning daily to weigh and keep records of the milk production of their cows.

The past season was one of scarcity in Guernsey as elsewhere. Hay was selling as high as $35 per ton, and in consequence some of the young stock were said to be below normal but the majority were in good growing condition. The number of cattle which can be kept on the Island has reached the maximum. Breeders now look to outside buyers to take the surplus stock. Of the animals exported the vast majority are sent to the U. S. A. At the time of my visit four prominent American importers were on the island and expected to take away about four hundred animals. Numbers of bulls are sold annually to English dairymen and are crossed on the common cattle with a view to improving them. The total number of pedigreed animals in Guernsey, although constantly varying, is said to be only about 4,000. Last year there were about 1,000 females entered for registration in the Herd Book, and about 300 males.

The roads over which we drove were everywhere as good as most town streeets, better than many. Along both sides there were neat hedges or stone walls, but looking over them one could see the well kept fields, often more like lawns than ordinary fields.

Before concluding I must not forget to mention the kindness of all the people with whom we met. Although in every case upon our arrival at a farmhouse the residents were told that I had not come to purchase cattle, they spared no pains in displaying their animals, in answering questions and giving pedigrees. We were invited into their homes and were really in danger of injuring our digestive organs in trying to do justice to the good things set before us. Most of all I enjoyed tne delicious milk given us to drink; I had not tasted its equal for over five years.—K. G. MacKay, B. S. A. Scotsburn, N. S.

Cow-Ease

Prevents Ticks.

KEEPS FLIES OFF

Cattle and Horses

and allows cows to feed in peace, making **More Milk** and **More Money** for you. A clean, harmless liquid preparation, applied with a sprayer. Keeps cows in good condition, and saves five times its cost in extra milk.

TRIAL OFFER

HAD DYSPEPSIA
FOR TEN YEARS

COULD NOT KEEP ANYTHING ON HER STOMACH

Dyspepsia is caused by poor digestion, and to get rid of this terrible affliction, it is necessary to place the stomach in a good condition. For this purpose Burdock Blood Bitters has no equal.

Mrs. Norman A. MacLeod, Port Bevis, N.S., writes:—"For the last ten years I suffered dreadfully with dyspepsia, and I could not keep anything on my stomach. I tried several kinds of medicines, but none of them seemed to do me any good. At last a friend advised me to try Burdock Blood Bitters, which I did, and after using five bottles I was completely cured. I would advise any one troubled with stomach trouble to use B.B.B. I cannot recommend it too highly."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

LIVE STOCK.

The Sheep Industry.

A New Appointment in the Live Stock Branch.

Two years ago the prospect of any extension of sheep raising in Canada appeared very remote. Except in the case of breeders of pure bred flocks, the prevailing attitude regarding the possibilities to be attained through a development of the industry was largely one of indifference and unconcern. To-day, however, a very great change in point of view is manifested, particularly on the part of farmers interested only in the breeding and rearing of market sheep. This change has doubtless been brought about on the one hand by the increasing domestic consumption of mutton and lamb. On the other hand, however, it has with equal certainty been hastened and confirmed as a result of the investigations of the Sheep Commission of the problems confronting the sheep farmer in this country and of the manner in which a decadent but attractive business might be revived.

The interest awakened by tne latter movement on the part of the Federal Government was further strengthened by the suggestive lectures delivered by Mr. Ritch during the early months of the present year at meetings attended by him in the Maritime Provinces and later at meetings attended by Messrs. Ritch and MacRae in the provinces of Saskatchewan, Alberta and British Columbia. "The Government is doing something" was the apprecative comment of the Western sheep man, after the conclusion of one of the recent lectures, and this statement is expressive of the temper of sheep growers, both in the East and in the West, who are gratified to know that in their interests something definite is now being undertaken.

An announcement has already been made regarding the action of the Minister in making provision for a special sale, during the months of September and October next, of pure bred rams and grade ewes in the Maritime Provinces and in British Columbia. It has been ascertained that these provinces have need, not only of selected sires, but also of female stock to serve as the foundation of grade flocks for the production of marketable lambs. The co-operation of the Dominion Sheep Breeders' Association has been secured to assist in this work and a grant of $15,000.00 has been made direct to theAssociation, to be expended for this purpose, in accordance with certain conditions imposed by the Minister. The responsibility for the expenditure of this grant has been delegated to a special committee of the Association, in conjunction with the Secretary, Mr. A.P. Westervelt, and the members of this committee, acting in association with officers of the Live Stock Branch, are at present engaged in selecting the most suitable centres for the holding of the proposed sales. They are also personally interviewing the farmers of these districts, with the view of securing their interest and co-operation in connection with the sale of the sheep. Subsequent to the distribution of selected breeding stock in different localities, it is proposed that the appointment of one or more experienced sheep men shall be arranged for who shall spend their time in visiting the farms of those to whom the sheep are sold, in order that the latter may have the benefit of competent advice regarding the management of their flocks, the care of wool, marketing of the clip and disposal of their lamb crop. As the result of this policy, it is believed that these centres will ultimately become distributing points for high-class breeding stock and influential agencies in bringing about an extension of sheep keeping in the different provinces.

In consequence of the work initiated by the members of the Sheep Commission, the Minister is now in receipt, from time to time, of requests for special assistance in connection with certain problems relating to both the sheep and wool industries. The final disbanding of the Commission has made it necessary that definite provision be made for the effective administration of the policy to which the Department is now committed to further the development of the keeping of sheep in Canada. The Minister has, therefore, considered it advisable to arrange for the appointment of a sheep expert to assume charge, under the Live Stock Commissioner, of the work to be undertaken in furtherance of this policy.

He has been fortunate in securing for this position Mr. T. R. Arkell, Professor of Animal Husbandry in the New Hampshire Agricultural College. Mr. Arkell is the son of Henry Arkell, Esq., Arkell, Ontario, the well known breeder of Oxford Down sheep. He received his primary education at the Guelph Collegiate Institute and is a graduate of the Ontario Agricultural College. His early training has made him familiar with every phase of the breeding and management of sheep, and, since his appointment to the position of Professor of Animal Husbandry in the New Hampshire College, he has devoted himself especially to experimental work in feeding and breeding and has made a study, under very advantageous conditions, of problems relating to the production and marketing of wool. He has organized, amongst the farmers of New Hampshire, a co-operative scheme for the sale of their wool clip, and, in addition, has undertaken considerable extension work which has given him very valuable experience. He is now recognized in Canada and the United States as a specialist in sheep husbandry and has won for his work the attention of some of the most eminent experts in breeding and experimentation.

Mr. Arkell is to join the staff of the Live Stock Branch before the middle of the current month and will proceed immediately to the provinces of Saskatchewan and Alberta to advise with the wool growers regarding the handling of their present season's clip and to make preliminary arrangements for the undertaking of an extensive shipment of Canadian wool

The Latest Thing in Stoves

For a midnight supper, as for any other meal at any other time, the very latest thing in stoves—the best that stove-artists can do—is a

It Burns Oil —*No Ashes*
It Concentrates Heat —*No Waste*

It is Ready —*No Delay*

New Perfection
WICK BLUE FLAME
Oil Cook-stove

It concentrates the heat when you want it and where you want it. It is as quick as gas, steadier and handier than coal, cheaper than electricity.

The New Perfection Stove has long, enameled, turquoise-blue chimneys. It is handsomely finished in nickel, with cabinet top, drop shelves, towel racks, etc. Made with 1, 2 or 3 burners.

All dealers carry the New Perfection Stove. Free Cook-Book with every stove. Cook-Book also given to anyone sending 5 cents to cover mailing cost.

THE IMPERIAL OIL COMPANY, Limited

The Summer Pests!

At Last You Can Keep Flies off Your Cattle

With the thermometer rising up continuously think of the suffering of your domestic animals that are tortured by flies, mosquitoes and other insects.

As an experienced farmer YOU KNOW that the torment to which your cattle is submitted during the summer months, exhausts them, causes them to decline, to lose weight and in many cases even endangers their life.

There is only one way to keep away the flies, destroy all parasites (lice, tick, fleas, etc.) and restore your animals to perfect health. Simply sprinkle that most wonderful insect destroyer and disinfectant

COW COMFORT

on your cows, horses, swine, goats, sheep, dogs, poultry and all insects will be quickly destroyed. The chemicals in this preparation will positively prevent flies and mosquitoes from swarming about your animals.

Cow Comfort also has soothing, antiseptic qualities that will cure all sores or skin diseases that may affect your cattle.

We cannot insist too strongly upon the benefits YOU will derive from the use of Cow Comfort on your cows—you will find that when they are rid of flies and other insects their yield of milk will be greatly increased and of better quality.

Sold in gallon cans at $2.00 each, but as the contents of a can is to be diluted in four gallons of water, it makes the price really 40c. a gallon.

Cow Profits

COW comfort and cow sanitation result in more cow profits, and this alone should induce any farmer or dairyman to install our Sanitary Steel Stalls and Stanchions. They allow free passage of light and air in a stable and ensure perfect sanitation and ventilation—a result impossible with any wooden equipment.

Louden's Stalls and Stanchions

are actually cheaper than wood. Louden Stalls of heavy tubular steel with malleable fittings, have no flat surfaces for dust to accumulate and no rough or sharp corners to injure or chafe the cows. Louden Stanchions give cows the greatest possible comfort and freedom, yet keep them perfectly lined up. Latch easily opened or closed with gloved hand yet is completely "cow proof."

Louden's Barn Equipments

include Feed and Litter Carriers, Hay Tools and Louden's Bird-Proof Barn Door Hanger. Send for complete catalogue. It is cheaper to put LOUDEN QUALITY into your barn at first than to experiment with inferior equipment.

Write to-day for our Catalogue of modern labor- and money-saving equipment.

LOUDEN MACHINERY CO.
Dept. 315 GUELPH, Ont.

A sprained ankle may as a rule be cured in from three to four days by applying Chamberlain's Liniment and observing the directions with each bottle. For sale by all dealers.

to Great Britain in 1913. A systematic collection of wool samples will also be commenced immediately to provide for illustration exhibits of wool, requests for which have already been received from several of our Agricultural Colleges and Winter Fair Boards. A comprehensive effort to systematize and improve the methods employed in connection with the production and sale of wool will, undoubtedly, greatly assist in encouraging sheep farmers throughout the Dominion and in stimulating a wider interest in the business. This work, therefore, will receive Mr. Arkell's first attention and will constitute the primary step in an active and energetic propaganda which it is hoped may promote the organization of a prosperous and progressive industry.

White Scours or Diarrhoea in Calves.

It is now generally recognized that diarrhea among young calves is due to a bacterial infection. Several different kinds of bacteria have been found to cause the disease. The great majority of cases, however, are caused by various forms of the common coli bacteria, or by a nearly related species, the paracoli. These species of bacteria are found in the intestines of all healthy animals. Ordinarily they are perfectly harmless. Sometimes, because of improper feeding or other causes, a calf becomes so weakened that these bacteria are able to set up a severe inflammation in the alimentary canal. This produces the diarrhea or scours, and usually results in the death of the calf. After passage through one or two such calves these bacteria acquire a greatly increased virulence. They are then able to attack healthy calves and cause their death. When such a virulent strain is once established in a barn it is very difficult to get rid of it. The infected calves are daily passing billions of these bacteria with their droppings. These are carried about from one part of the barn to another on the shoes and clothing of the attendants, by the bedding and even by the dust in the air.

The calves may become infected in various ways. Infection through the naval cord happens occasionally, but this does not occur so frequently as is generally supposed. A much more frequent method of infection is through the mouth. The calf brings its nose and mouth in contact with the soiled bedding and the sides of the stall. In this way it may take in many of the virulent organisms. If the milk of the calf is not handled in a sanitary manner this also is a frequent source of infection.

A knowledge of the cause of the disease renders methods of prevention much simpler. On farms where the disease is not serious it is only necessary to see that the calf is born in a clean stall and is kept well supplied with clean bedding. Such a stall should be thoroughly cleaned and disinfected each time before it is used. After the calf is weaned careful attention should be given to the milk. It is necessary that the milk should be handled in a cleanly manner. The milk must be fresh and should be warmed to 95 degs. F. It should be given in clean pails which are kept especially for that purpose. After use these pails should then be thoroughly washed and scalded. It would be still better if all the milk used were pasteurized by heating barely to 140 degs. F. for twenty minutes. Such treatment will kill all diarrhea and tuberculosis germs.

(Continued on page 664)

The General Says:

"If I could show you through my three enormous mills you would then readily see why I can manufacture highest grade, durable Roofing at a low cost and do not hesitate to guarantee it to you for 15 years. That's why I call it *Certain-teed* Roofing, Quality Certified, Durability Guaranteed."

The quality of the asphalt used in roof coverings is important because **roofs don't wear out, they dry out.** The real life of the roofing is in the saturating and waterproofing compound used. Only the best grades of raw materials are used in the manufacture of *Certain-teed* Roofing. These are selected as the result of a quarter of a century's experience and kept up-to-date by the General's Board of Expert Chemists.

Look for the Certain-teed label when you buy Roofing—quality and durability guaranteed.

On each and every roll of *Certain-teed* Rubber Roofing or bundle of *Certain-teed* Rubber Shingles you buy from your local dealer you will find a *Certain-teed* label of quality—a 15-year guarantee. Insist on this *Certain-teed* label—it is for *your protection*. *Certain-teed* Roofing is sold throughout the Provinces of Canada by local dealers, and is distributed by wholesale jobbers in St. John, Halifax, Quebec, Montreal, Toronto, London, Winnipeg, Vancouver and Victoria. RU-BER-OID Roofing

Lasts, Lasts, Lasts, Lasts

We do not guarantee RU-BER-OID Roofing for any definite number of years, because we do not know yet how long it will last.

The first RU-BER-OID Roofs, laid 21 years ago, are still water-tight, weather-proof, and giving perfect service—and they look good for many years more. This remarkable durability is due to the RU-BER-OID gum with which the fabric is saturated and coated. It is a compound of our own, tasteless, odorless, not affected by extreme heat or cold, by fumes, gases, or any other of the enemies which destroy roofing.

In years of tests, on all sorts of buildings, in all sorts of climates, RU-BER-OID has proved conclusively that it gives longer and more complete protection per dollar of cost than does any other roofing. Write for samples and Booklets.

THE HORSE.

Driving Harness Horses.

In ordinary driving, especially when a curb-bit is used, the reins should be separated with the first two fingers of the left hand, the ends passing out of the lower part of it. The thumb should be held with the point upwards, not pressing down firmly upon the reins. The wrist should be bent, so that the knuckles are turned towards the waist and the elbow is bent at the left side. The hand should be held at a height approximately opposite the waistband.

The right hand holds the whip, at about ten inches from the end, the lash-end of it is directed upwards, forwards, and towards the left.

The left hand should always be kept in the same position but the right one, besides holding the whip, should be used to assist the left.

The lower part of the right hand may rest upon the off-rein, in front of the left, to assist in steading the tension of the reins, also in turning and guiding it may be used on either. If the left hand requires aid in exerting traction, the right placed in front, and dividing the reins by the two middle fingers, may assist it; and also in shortening the reins, the right hand pushes them back between the fingers of the left.

The near rein is always held uppermost, passing over the index finger of the left hand, while the off-rein passes between the second and third fingers.

The position of the driver should be easy and unconstrained, but approximately erect, with the arms dropping along the sides, and elbows squarred at the waist. The legs, from the knees downwards should slant slightly backwards, and the driver should not sit too far back in his seat.—Dr. F. C. Grenside in O. A. C. Review.

Weaning Foals.

Comparatively early weaning is beneficial to the foal, and almost essential to the mare if she is again in foal. Keeping a foal unnecessarily long with his dam cannot fail to have a prejudicial effect upon the foal she is carrying, and also to enfeeble the mare.

Weaning time is a crucial point in the life of many a young horse, for many are injured, and some positively ruined, by injudicious treatment. It should be unnecessary to insist upon the fact that the young foal when he is weaned needs generous treatment, fresh air, and plenty of exercise. Even before he has forgotten his dam, and he will not be long in forgetting her, he shouln have a run out every day in a paddock or field where there are no other horses to disturb him. The foals on a farm, if they have been run together when with their dams can also be run together when first weaned, and will be nice company for each other.

But even if the grass they are on looks well, and there seems to be plenty of it, it must be borne in mind that September grass has not the "feed" in it that the grass of early summer has. So the foal must be liberally fed, and the best he can be fed upon are good oats and meadow hay. It is good business to give him the hay as well as the oats, even if the grass is flush and good. This for more reasons than one; autumn grass has a tendency to scour young animals if it is very flush, and the hay will act as a corrective. The foal will, however, soon tell his owner if he is well fed and judiciously managed, and an observant man should be able to detect any drooping off in condition before any mischief is done.

Finally, a couple of hints may not be untimely. The first is that common indifferent oats are never cheap food for horses; the second is to keep a look-out for worms, which are frequently troublesome at weaning time.

Carrots For Horses.

Carrots contain a smaller proportion of moisture and more nutriment than any other roots. They are good for cows or horses, but seem to be especially adapted for the latter. Horse owners who can do so should grow carrots, and those who have not the proper land should buy enough carrots to give a ration every day through winter.

Give half as many oats as usual and make up the deficiecy with equal bulk of carrots, and most horses during the winter months improve in appearance. The carrots give the animals a sleek coat, probably by helping the digestion. It is a diet of exclusively dry feed that makes the hair of many idle horses in winter dry and harsh. If the horse is working he will need the full ration of oats, besides should be given a ration of carrots each day.

The duration of the period of pregnancy in mares extends from 300 to 400 days, but usually ends about the close of the eleventh month. First pregnancies frequently go a year. The extreme length of the period makes rebreeding at the earliest possible opportunity absolutely necessary if the mare is to maintain a record as a yearly producer. The mare that goes barren a year simply reduces the profits of the farm to the extent of the net value of her foal; for while she may do more work when not pregnant, the work can so be arranged as to permit of maternity on her part.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

Caustic Balsam

IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

At the Yarmouth Y. M. C. A. Boys' Camp, held at Tusket Falls in August, I found Minard's Liniment most beneficial for sun burn, an immediate relief for colic and toothache.

ALFRED STOKES.
General Secretary.

A GREAT SCANDAL

Big Efforts to Hush the Matter Up-- The Truth Out At Last. . . .

From exhaustive enquiries made during the last few months we find there have been a number of patients kept under conditions which to say the least of it, is a great scandal.

We trust our readers will bear with us for a moment. The facts of the matter are these, there have been some thousands of cases where horses have been suffering from distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements, of all kinds, and in some cases no attempt has been made to relieve their sufferings, their owners either being indifferent, or where they have thought at all about their animals, have had recourse to cheap so-called remedies, of which there are unfortunately a few on the market, but which, while so may give a little relief temporarily, cannot from the nature of their ingredients give permanent relief or effect a cure.

It is high time in our opinion that something should be done to bring this state of things to an end, and with this in view we are about to take drastic action, to bring before every owner of horses that wonderful remedy known to all as "Dr. J. Woodbury's Horse Liniment."

This remedy has been used for years throughout the Dominion during which time it has been used in hundreds and hundreds of cases, comprising distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in no case to our knowledge, has "Dr. J. Woodbury's Liniment" failed to first relieve, and then to cure the above mentioned complaints.

Every owner of horses should, if they have not already got a bottle of this Liniment in their stable, immediately procure one. It is the only guaranteed remedy we know of, and it is a cheap form of insurance, and it will be found, that, if used immediately any symptoms of any of the above complaints appear, to give immediate relief, and probably save tremendous expense, probably the life of the horse as well.

Dr. J. Woodbury's Horse Liniment is sold by Stores and Chemists throughout Canada, but should your Store-keeper be out of stock he will procure it for you, and if you should find any trouble in getting a bottle, don't delay for an instant in mailing 25 cents and a bottle will be immediately forwarded you.

POULTRY.

How the Orchard and Poultry Plant Were Successfully Built up Together in a New Hampshire Farm.

A judicious mingling of hens and apples has enabled C. E. L. Hayward of Hancock, N. H., according to the Boston Herald, to develop a rough, rocky and uneven bit of run-out soil into the largest fruit and poultry farm in New England and to earn a profit which varies from $16,000 to $26,000 a year. The result has been brought about by a quarter of a century of unremitting labor and the evolution of a successful scheme of strictly business management.

As it stands today the land supports an orchard of 10,000 trees and 5,000 hens. At first sight it looks like a diminutive town with its long streets of poultry houses which now number 720. At first the hens were merely incidental to the apples and were kept chiefly for their value in producing valuable fertilizer, but with the growth of the industry both branches have been placed upon a paying basis, and both hens and apples contribute to the general success of the undertaking.

When Mr. Hayward first started he had an orchard of some 400 trees in more or less promising condition. He added a few hundred hens soon after taking possession.

As seasons passed Mr. Hayward has added little by little to his holdings. The orchards gradually increased in size as the years went by until today close to 500 acres are covered with 10,000 apple trees.

The soil is a black loam with a hardpan subsoil imprevious to water, thus holding the moisture well. Most of the land is very rocky which does not permit cultivating the orchards.

The young trees are mulched with hay the first few years until they have reached a good growth, but not fertilized to any extent until ten years after they have been set out. Spraying is done twice before the blossoms open. The Bordeaux mixture being usen at an actual cost of eight cents a tree. Pruning takes place from November until March, under the direction of an expert. The brush is hauled away and burned.

The poultry houses are cleaned three times during the year, October, April and July and their contents is spread in a tnin coat in a circle around the trees as far out as the branches extend.

Harvesting the big crop which mounts up some years to 10,000 barrels means a large force of men and several teams to haul the crop to the railroad station four miles away. About 60 men are employed to harvest the apples.

The price per barrel realized for several years has been $3@3.50@$4. Commission merchants in Liverpool, England, handle the fruit and returns are made less cost of shipment and commission.

The actual profit per barrel last year was $2, or upon last year's crop of 6,000 barrels $12,000. A crop of 10,000 barrels, a lew years ago brought a net profit of $20,000.

The poultry houses are arranged in rows in the apple orchards about 40 feet each way. Each house is A shaped with the floor, wind and storm proof on all sides save the front, which is covered with inch mesh wire netting. At the base of the floor the houses are 8x8 feet and 8 feet in height. The roof and back side are shingled, while the front is boarded up 18 inches. The cost of such houses is $20, and they will last about 20 years.

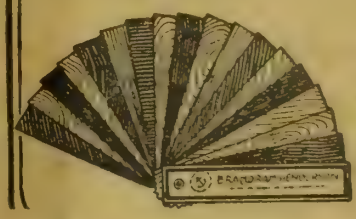
SHINGLE STAINS

The Best Preservative of Undressed Wood

Anchor Shingle Stains indefinitely postpone, if not absolutely prevent wet or dry rot. They show up the grain of the wood, giving delicately artistic finish, not only to the surface coated, but to the entire building.

We have used infinite pains in the selection of pigments best suited to combine with our specially treated **COAL TAR CREOSOTE,** and our success has been proportionate with our care.

Anchor Shingle Stains are being very largely used on the roofs, and in many instances also on the bodies, of the most attractive houses in our midst; they are also employed with excellent results from an economic standpoint on sheds and other outbuildings.



If your dealer cannot at the moment supply Anchor Shingle Stains, please write us to arrange for you.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Unkissed Children.

This world's a rare and joyous place
For those who deem it so,
With smiles enough for every face—
This is no tale of woe.
But yet, when all's been done and said,
Some little children creep,
At cuddling time unkissed to bed,
And sob themselves to sleep.

Their daddy's off at work, somewhere,
Their mamma's tired and worn,
Both burdened down with carking care
From the first break of morn.
Each love-starved young one on the list
Has troubles by the heap,
Yet each must go to bed unkissed,
And sob himself to sleep.

Oh! world of sunshine mixed with storm,
Oh! world of tears and joy,
Oh! world of frozen hearts and warm
Oh! world of man and boy!
Less were your sorrow, less your dread,
If, when night's shadows creep,
Each little lad went kissed to bed,
And smiled himself to sleep.

By Dreamer.

Mrs. McCord's Match.

"Mrs Avery isn't here this morning?" said Mrs. Gross, as she shook hands with the minister.

"No, she wasn't feeling very well, and I told her she would better stay in out of the cold," said Mr. Avery. "She is rather saving her strength for the missionary meeting to-morrow."

With face drawn into severe lines, Mrs. McCord stood by, listening. "Mrs. Gross, I'd like to see you a minute, privately," she said, as soon as the minister turned to another member of his flock. He was at the church door shaking hands with the last stragglers after services, and Mrs. McCord had already shaken hands and assured him how much she enjoyed the sermon. "I have a little matter I wish to speak to you about."

Mrs. Gross sighed, and walked meekly after Mrs. McCord. Mrs. Gross was plump and rosy. while Mrs. McCord was thin and angular but the latter ruled with a rod of iron where she ruled at all. "I do hope you'll be careful not to mention that Mrs. Avery was not at church this morning," she said, in a whisper. "Mr. Avery is new, and he needs all the support we can give him."

'I don't know that there's anything wrong in asking about the minister's wife," said Mrs. Gross striving to pluck up courage to "talk back" to Mrs. McCord, as her husband was ever advising her to do.

.'But the way you said it! It just sounded as if you thought she ought to be in her place. Outsiders are doing a great deal of talking about Mrs. Avery, and it behooves the church people to stand by her. If it got out that the wife of an official member publicy complained about the minister's wife, gossips would make great capital of it. I hope you will be more careful."

"Are you ready, Mary?" asked Mr. Gross, rescuing his meek wife from Mrsf McCord's clutches. "I have been waiting these fifteen minutes. How do you do, Mrs. McCord? Fine sermon, wasn't it?" "Indeed it was," assented Mrs. McCord. I was just telling yout wife that we must stand by the minister and his family. There is some criticism from people outside the church about his delivery and his pulpit methods, but if we stand by him he'll get along all right.

"Oh, he'll get along first-rate," said Mr. Gross, while his wife pinched his arm black and blue. "If gossips and people who think they can run everything in and out af the church will let him get a start, he'll get a good start."

"Just what I said to your wife," said Mrs. McCord. "My words exactly!"

Mrs Gross stopped trying to warn her husband, and instead coughed loudly into her handkerchief. She might have known that Mrs. McCord would never be touched by the plainest of plain hints, for she considered herself the pattern for the whole congregation. Every unkind word she ever heard about the minister she always hastened to tell him, so he would be 'on his guard," and among the members of the congregation she acted like a very busy wasp stinging here and there, as she went about telling this one what to do and that one how to act. Every one knew her, and all made allowance for her, but it required heroism to have patience with her petty directions and fussy ways.

"Yau must come up to the parsonage this week," Mr. Avery was saying to a young lady as they reached the door. "My neice, Cordelia Everton is coming to visit us, and I hope all the young folks will come in to see her. She is just out of high school, and we think her a very lively, interesting girl."

"Now the next thing somebody will be saying is that things are too gay at the parsonage," said Mrs. McCord, as they reached the street. "It beats all how faultfinding and cranky some people are. I'm going to tell Mr. Avery to be on his guard against anything of that sort. For my part, I always have enough to do to attend to my own affairs, but some people are prone to gossip. I heard the other day that Mrs. Warfield said she thought Mr. Avery's sermons sounded as if he got them out of a book, and I intend to call and ask her to be extremely careful what she says. You know how a thing like that runs through a town, and I think the sooner it's hushed up the better.

Finally the McCords—Mrs. McCord and her little, dried up husband—turned down their street, and Mr. and Mrs. Gross went on alone. "Did you ever see such a women?" burst out Mr. Gross. "She would make an interesting character for a novelist. Always running with her little bits of gossip to the parsonage, and always telling everybody in the congregation their duty. I'd give a pretty penny to see her meet her match some day—but she never will. There's only one like her in this part of the world,or the whole globe for that matter."

The next day Cordelia Everton arrived, and to all observers seemed to be a modest, pretty young girl in a stylish but plain costume who greeted the members of the congregation who happened to be at the station, and to whom her uncle introduced her while waiting for the hack, with charming friendliness. Before the end of the week she knew a number of people, and seemed to be enjoying herself in the little city immensely.

"How do you do?" said Mrs. McCord, as Cordelia opened the door for her one cold winter day. "Is Mrs. Avery at home? Out calling on Mrs. Warfield, is she? Isn't that odd! I came to see her particularly this afternoon about Mrs. Warfield. Well, I might come in and sit down a few minutes by the fire. It's a dreadful day, but when I have a duty to perform I never let the weather stand in my way. I feel real worried about your aunt being over there. You know Mrs. Warfield isn't a member of our church, and it is so important that people are careful what they say to her. I heard on good authority that she said Mr. Avery's sermons sounded as if they were taken out of a book, so I thought I'd put our pastor on his guard."

"Wasn't that lovely?" said Cordelis "I think that is the finest compliment Uncle James ever received. He is so scholarly and precise in his language, but often peonle forget to mention it. Mrs. Warfield must be a delightful person."

"Well, er—that is—yes, I do think, Mr Avery uses very good language," said Mrs. McCord. I said to—

"Here comes auntie!" cried Cordelia, springing up tp help that lady remove her wraps. "Auntie, Mrs. McCord came to tell you something very nice she heard about Uncle James. The lady you just went to call on said his sermons sounded exactly as if they were taken from a book. You know every critic says that speaking is so much harder than reading, as grammatical errors will creep in that are most impossible to print, so if Uncle James is pleasing that scholarly element in town, that is a fine beginning."

Mrs. McCord was provoked beyond measure, and tried to change the conversation, but Cordelia again and again returned to the object of her call that afternoon. In sheer desperation the visitor rose to go an hour before she usually departed, and her name was not mentioned by her hostess the rest of the afternoon.

Two days later Mrs. McCord again dropped into the parsonage with another criticism she had heard, but scarcely had she finished telling "she said" and what "I said," when Cordelia who had been sitting on the edge of her chair waiting for a pause in the conversation broke in with: "I heard such a nice thing about you, Mrs. McCord. Mrs. Randall said you were the best informed person on local affairs that she knew. Wasn't that nice? She said if ever any one got out a history of this country, you would be the most valuable person to consult, as you were authority on local events."

"Did Mrs. Randall say that?" said Mrs. McCord.

"Indeed she did," said Cordelia. "She said you had a most wonderful memory and never forgot anything. She says when any one wants to know about the past, especially church doings, you can always furnish days and dates. She said many of the happenings would have been forgotten long ago if you had not kept them alive. How did you ever manage to have such a keen memory, or is it a cultivated possession."

Whether it was cultivated or not Mrs. McCord never explained, for just then other callers came and she made her escape. In her heart she determined to stay away from the parsonage while Cordelia was there, simply because she found herself tongue-tied in the presence of this bright eyed girl; but she could not escape seeing her unless she stayed at home from every church meeting.

"How do you do, Mrs. McCord?" said Cordelia demurely, as that lady opened her front door a week later, and found the parsonage visitor on her step. "You weren't at church Sunday, and I came to see if you were ill. The ladies all said nothing short of sickness would keep you at home, and as Uncle James was busy, I thougv? I wodld look you up. And then, I have something special to see you about," she went on as the hostess reluctantly led her into the parlor. "I have been so anxious to tell that a young couple from my home town are to locate near you. The young man is a dentist and is anxious to get a start in business. You know so much depends upon a good start. And I am particularly worried about his wife. She is a friend of mine and such a nice girl. If the neighbors begin criticising her in a strange town, it will be dreadful. Mrs. Slocum told me you always went around whenever some new people came into the church and cautioned

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

TWO WOMEN TESTIFY

What Lydia E. Pinkham's Vegetable Compound Did For Their Health—Their own Statements Follow.

Haliburton, P.E.I.:—"I had a doctor examine me and he said I had falling of the womb, so I have been taking Lydia E. Pinkham's Vegetable Compound and it has done me a lot of good. All the bearing-down pains have vanished. I have gained ten pounds in weight, the discharge is all gone, and I feel better than I have for a long time. I think any woman is foolish to suffer as I did for the sake of a few dollars.

"You can use my letter as a testimonial. It may encourage other poor women who suffer as I did to use your Vegetable Compound." — Mrs. GEO. COLLICUTT, Haliburton, Lot 7, P.E.I.

Read What This Woman Says:

New Moorefield, Ohio.—"I take great pleasure in thanking you for what your Vegetable Compound has done for me. I had bearing down pains, was dizzy and weak, had pains in lower back and could not be upon my feet long enough to get a meal. As long as I laid on my back I would feel better, but when I would get up those bearing down pains would come back, and the doctor said I had female trouble. Lydia E. Pinkham's Vegetable Compound was the only medicine that helped me and I have been growing stronger ever since I commenced to take it. I hope it will help other suffering women as it has me. You can use this letter."—Mrs. CASSIE LLOYD, New Moorefield, Clark Co., Ohio.

the neighbors to be very kind and attentive to them, so I thought of you at once. Mrs. Warren, that's the young women's name, plays a little, and she might feel complimented on being asked to play at church. Mrs. Jessus says the music committee depends on you so much in picking out an organist, that you might say a good word for Mrs. Warren. And she isn't a very good housekeeper, being an amateur, so I thought you might caution the neighbors about that. Somebody told me how you did when the minister came to this town with a young and inexperienced bride once. Was it Mrs. Warfield who laughed at the poor bride's cloudy jelly and you went to ask her not to mention it to any one for fear it would hurt the church work? It seems to me that was the way I heard it."

'It seems to me some people have little to do to tell a pack of stuff like that," put in Mrs. McCord with an acid voice.

"That's just what I say," said Cordelia, "and that's the reason I came direct to you. I knew you had no patience with that sort of thing, so if the neighbors begin talking about Mrs. Warren's housekeeping, which is far from perfect, you will know just what to do to stop all criticisms. It's wonderful to have your ability, Mrs. McCord, but everyone insists that there isn't another women in the world like you."

The young people Cordelia had met during her stay gave her a farewell party at which fun reigned in spite of the fact that they were all sorry to lose her. Mrs. Gross came panting in just before refreshments were served with a huge cake iced with white and decorated with wonderful gorget-me-nots. "I'd just like to see Cordelia a minute," she uanted, out of breath from her hasty walk. "Want to thank her for all she has done for us."

So Cordelia, flushed and happy, slipped out to the kitchen, and Mrs. Gross kissed the glowing cheeks of the girl she had learned to love. "My dear child" she said, looking up at the tall, beautiful Cordelia, "I am so sorry to see you go. You have done us all a world of good and I want to thank you for it. Mrs. McCord hasn't lectured me for a month, and I don't believe she ever will again. Mr. Gross said to tell you he had remarked over and over that Mrs McCord would never meet her match, but he is agreeably disappointed. If ever she does badger us again, you'll come back, won't you, dear?"

"I? Mrs. McCord? What in the world are you saying, Mrs. Gross?" said Cordelia innociently enough but a guilty color stained her round cheek. "Poor auntie had endured so much from just such a women in the town they left and I couldn't bear to see her worried to death here. The people outside the church are angelic compared with one or two members of every congregation who feel it their duty to keep their eyes and hands on every thing for fear it goes to pieces. Yes, if you are sure I have done more good than harm, I'll be glad to come back some day. I don't know whether to regard it as a compliment or not to say that I am a match for Mrs. NcCord,but I'll think it over."

"It is the greatest compliment in the world," insisted Mrs. Gross, and if you need any other reward just look at your aunt's happy face. We'll not forget your methods of managing, but we want you to come back just as soon as you can. And now, dear, you mustn't waste time any longer on an old woman, but hurry back to your good time, and I'll lend a hand with the lunch. Good-bye. Run along quickly."—Zion's Herald.

TO RENT

Three farms in Northern New Brunswick, within two and three miles of a thriving town, near cheese factory, churches, schools and a popular Summer resort. Land in good state of fertility, free of stumps and boulders, well drained. Dwellings and all needful out-buildings for dairying, one having a steam creamery plant. Owner removing to a university city. Apply to

B. HARRIS,
Bathurst, N.B.

It is now well known that not more than one case of rheumatism in ten requires any internal treatment whatever. All that is needed is a free application of Chamberlain's Liniment and massaging the parts at each application. Try it and see how quickly it will relieve the pain and soreness. Sold by all dealers.

Kitchen Clothes.

What's the use of looking untidy when you might just as easily look nice? Why, when you do your own work, and spend a good bit of time in the kitchen, do you not have a frock for it, as well made and as tasteful and appropriate as your afternoon and evening dresses? Why does the ring of the door bell send a pang of d ismay to the heart of many a working house-wife, not because she minds the interruption, but merely because she is "such a sight to go to the door?"

What we need is a Gospel of Kitchen Clothes, then perhaps we will discard the wornout doctrine that anything is good enough in which to do housework. As it is, an observer is bound to remark that kitchen clothes may be divided into three sorts: First, the dressing saque worn with an old nondescript skirt; second, the cheap, ready-made wrapper, which is far from attractive in appearance though it has some good qualities; third, worn out nnery, such as ancient silk waists and frocks, with most of the trimming ripped off and in a general state of forlorn dilapidation. Right here let me say that until you have seen a stained and soiled pale-blue crepe de chene of the style of five years ago busily flying about the kitchen, getting breakfast, you have not seen kitchen clothes at their worst. But the other varieties mentioned can be preety bad. Add to them various ill-fitting and ill-made aprons and you have an ensemble which is guaranteed to effect unhappily the life of any household.

Now, it's all very easy to say what not to wear in the kitchen, but that does not help very far to learn what to wear. So for that we must make a little call on the plain neighbour who lives on the other side of the street from the Pretty Neighbor, and is just as neat and trim in her dress as the Pretty Neighbor is careless.

"I have two kitchen frocks for summer and two for winter," says the Plain Neighbor. "And I make them myself. The winter ones are of cotton flannelet, with a smooth-finished outer surface, that costs fifteen cents a yard, though in some shops you can get it for twelve and a half cents. I got a black-and-white shepherd's plaid and a plain dark blue with little white dots, and made them up in plain five-gored skirts that clear the floor and hang evenly, and regular shirt-waist blouses with long sleeve. I make the cuffs adjustable in size, with two buttons and one buttonhole, and then when I want to push my sleeves above my elbow I can use the outer button and hold them there securely. I wear plain white linen collars, stiff, but not high, and in the regular turnover shape, and for my belts and ties," she laughed, "I have a little idea of my own. For the black-and-white dress I bought two dark-red windsor ties at twenty-five cents each, and I use one for a tie, just as anyone would, and in the other I worked two eyelets, slip my belt buckle into them and use it for a belt. I got dark-blue ties for the dark-blue dress, and use them in the same way.

"For summer I have two dresses—a dull blue chambray, that cost twelve cents a yard, and a gray-and-white-striped gingham. I can use the red belt and tie with the gray-and-white, and the dark blue set with the chambray, and one set of tie and belt lasts for several years—as, indeed, do the dresses themselves. The only difference in the making of the summer ones is that the sleeves are elbow length. All of the dresses are washable and the flannelet irons beautifully.

"The nicest thing about these dresses is that I can take off my apron, answer the bell, receive com-

Clay STEEL FARM Gates

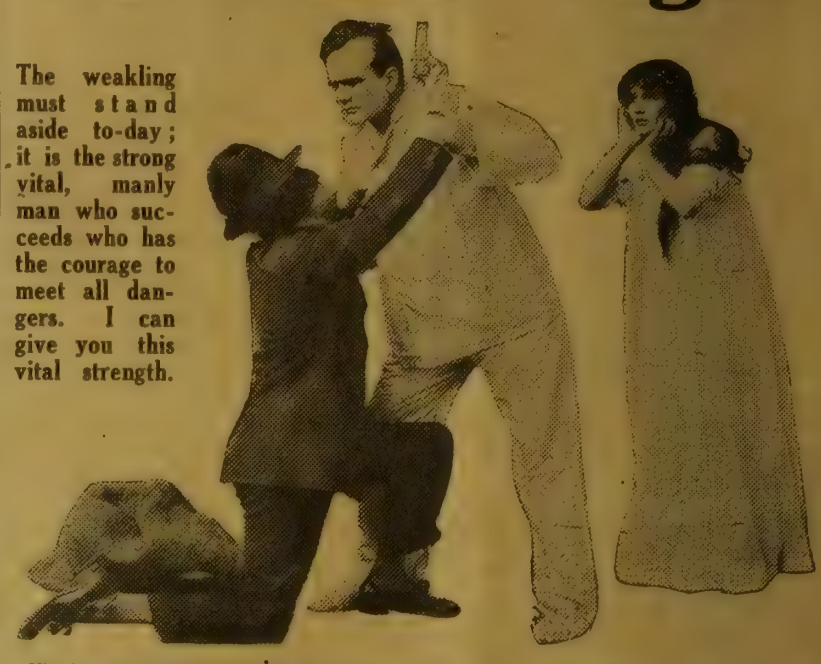
Cost less in the long run than any other farm gate made, for they last a life time; will not bend, break, sag, blow down or burn; are easy to work; will lift over snow in winter. Every gate guaranteed. 20,000 Clay Gates sold last year. Send for illustsated price list.

Canadian Gate Co. Ltd
54 Morris St., Guelph, Ont.

One or a dozen Clay Gates will be sent for 60 DAYS FREE TRIAL. Prove them before you buy them. Try them out before haying begins.

Restores Men To Vital Vigor

The weakling must stand aside to-day; it is the strong vital, manly man who succeeds who has the courage to meet all dangers. I can give you this vital strength.



Vitality is the thing which makes success; it gives men that compelling power which sends them forth eager and equipped to meet and overcome all obstacles; it is the thing which gives our young men courage to face death; it is the thing which inspires and holds a woman's love and faith. No matter what your age, I can give you this same vigility. I can restore the vigor you lost, no matter what early or later indiscretion may have sapped your streagth. I can make you "young" and keep you "young." From an intimate and studious observation of possibly 100,000 weakened men I say to you that vitality or the lack of it means all the difference between a manly man and a half man. The man who bubbles with vital power will exert a pleasing influence upon all with whom he comes in contact; women are naturally attracted to him, as are men. Lack of vitality is a negative condition, and it even repels. You wear my Health Belt and suspensory attachment all night; it sends a great, glowing, health-giving current of electro-vimut into your nerves, blood and organs; it takes all the "kink" out of your back and all the coward out of your makeup; it puts you right up in the "feeling fine" class and keeps you there. No stimulation, no false results; just a sure return to manhood and courage. Recommended also for rheumatism, pain in the back, kidney, liver, stomach and bladder disorders. It makes you feel young and keeps you feeling young forever.

Let Me Send You THIS BOOK Free

Here is my latest illustrated book, "Health In Nature, containing a fund of privrte information relating to weaknesses of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely uo obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

DR. M. F. SANDEN, CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs:—Please forward me your Book, as advertised, free.

NAME .....

ADDRESS .....

pany, go to the store, talk to the postman, and so on, and yet not feel ashamed of my looks. The pretty ties and belt keep the dresses from seeming like a maid's costume, and all four of them didn't cost quite five dollars—and that includes belts and ties, too.

"You see, I had the dressing-sacque habit! I simply lived in them, and they used to irritate me so, for the sleeves would dip in my cookery, and they were so generally sloppy looking that one day I made up my mind that hereafter my husband and children should not have to see me and think of me as being such a fright. So I evolved the plan of kitchen clothes, and it has worked—well. Laying aside the effect it has had on my family, it has made me take greater pleasure in my housework, and really—don't laugh—has given me a lot more self-respect. And I've come to the belief that neatness is just as much a habit and just as easy a habit to acquire as untidiness, and that being neat helps you to be happy!"—Selected.

Sick-Room Hints.

Do not place the patient's bed facing a window, because even when the blind is down the light is apt to disturb him. In cases of serious illness all treatments and the hours when the medicines should have been given should be written down, also any new or unusual symptoms; this will help the memory of a tired nurse and assist the doctor. Make a point of always reading the label on the medicine bottle before pouring out a dose. A medicine measure is much better than tea or tablespoons, as these differ so in size. If the patient is sleeping, do not disturb him or her for anything, unless the doctor has ordered that the medicine or refreshment be given regularly regardless of sleep. To help insure a good night's rest and to prevent bed-sores, rub the entire back with methylated spirits or eau-de-Cologne at night. Pour about a half-teaspoonful in the palm of the hand and rub it well in with an upward stroke. It is very refreshing to a tired back; and if the parts over the hip-bones and the back between the hips are well rubbed for five minutes twice a day, the patient will not have bed sores. Always serve the meals daintily. If the toast and eggs are overcooked it would be better to waste them than to give them to the patient; a well-fed patient makes the quickest recovery. Clean either a bare or a carpeted floor with a damp cloth rung from and well rinsed in a bucketful of water. If the illness is contagious, make the water a milky colour with creolin; also dust the furniture with a cloth wrung from this water. To change the under sheet, fold the clean sheet into narrow folds, lengthwise. Have the patient turn on one side, unfold the clean sheet, one fold at a time, starting at the edge of the bed, and rumpling the soiled sheet loose ahead of it until the patient's back is reached; then when the patient is rolled on to the clean, smoothed sheet the rest of the soiled one can be easily removed, and the clean one smoothed over the other side of the bed.

Spring Greens.

Spinach—If possible have the spinach blanched; but if not, use the best and freshest you can get. Pick the leaves over and wash well, and put on to boil in plenty of boiling salted water; boil about fifteen minutes, drain through a colander and immerse in a pan of cold water. When thoroughly chilled, drain again and chop fine. In this condition it may be kept over night, or for two or three days if kept in a cool place. Put over the fire when wanted and boil until tender, drain any water that may be left on it, season with pepper, butter, salt and serve with a little lemon juice or vinegar.

Mustard Greens—Pick over and wash well about a gallon of mustard leaves; clean six spring onions, tops and all; have three or four small slices of pork side-meat fried rather brown and cut in small pieces. To this hot meat and the two tablespoonfuls of grease that fries out of it add the chopped mustard leaves, and pour over them at once one pint of hot water; cover closely and let boil until tender, then add salt and pepper, and when done remove to a dish and serve with vinegar.

108 Cheques Will be Distributed Among Canadian Farmers. Will You Get One of Them?

In addition to the twenty-seven first prizes of $50 each, there will be eighty-one other cash prizes, ranging from $10 to $25 in our

1912 PRIZE CONTEST FOR FARMERS

This contest is along the same lines as the one which was so successful last year, except that there are three times as many prizes, and therefore three times as many chances for each contestant to win. Every farmer in Canada who uses "Canada" Cement is eligible to compete. The conditions are such that large and small users of cement have equal opportunities to win a $50 prize.

The contest is divided into three classes, and there are first, second, third and fourth prizes ($50, $25, $15 and $10) in each class.

CLASS "A" - Prizes to be awarded to the four farmers in each province who use most "Canada" Cement on their farms in 1912.

CLASS "B" - Prizes to be awarded to the four farmers in each province who send photographs of the *best concrete work* done with "Canada" Cement on their farms in 1912.

CLASS "C"—Prizes to be awarded to the four farmers in each province who send the best *description*, telling how any piece of concrete work was done with "Canada" Cement. (Entries for this prize must be accompanied by photographs of the work.)

In addition to thus being divided into classes, so as to give small users of cement an equal chance with those who use more, the Contest is also divided into nine divisions, one for each province. So you see you need only to compete with the other farmers of your own province, and not with those all over Canada.

Don't think that because you have never used cement, you cannot win a prize. Many of last year's prize winners had never used cement before they entered the Contest. We will send you a free book, "What the Farmer Can Do With Concrete," that will not only help you in the Contest, but will tell you everything you could want to know about the use of cement on the farm.

Don't delay, but send us your name and address to-day and get this free book and full particulars of the Prize Contest right away.

Use a letter, postal or coupon.

Send me particulars of your 1912 Prize Contest.

AGENTS WANTED SEND FOR CIRCULARS

ILLSLEY & HARVEY COMPANY, LIMITED

Port williams, Nova Scotia.

FLORICULTURE.

A correspondant sends some Aster leaves that are covered with brown spots and states that a large bed of these plants have nearly all lost their leaves persumably by this cause. What causes the brown spots and what can be done to prevent a recurrence of the trouble next year?

The brown spots are evidently a fungous growth and judging by the leaves submitted for examination I would say that the plants are now practicably dead. This trouble may be caused by planting in the same soil year after year. Try fresh soil next season.

A correspondant wishes to know if it is ture that a Century plant blossoms once in one hundred years? ...There are cases on record where the plant commonly called Century plant bloomed at the age of twenty years. Fancy Century plant is more of a name than a fact as far as blooming is concerned.

Tulips that were dug out of beds this spring and heeled as recommended in our floral notes last June should be dug as soon as the leaves turn brown and dried out so that they may be ready for planting in November. Place them on dry sand and after they are thoroughly dry remove the dead tops and roots but not the outer skin. Sort them in sizes, placibg in one lot for blooming all bulbs larger than a chestnut and plant the smaller ones close together in an out-of-the-way corner to grow along for next season's blooming.

Cut the seed pods of the hardy perennials, roses and all plants that are done blooming, they not only look unsightly but injure the plants.

The leaf sent by H. O. N. is a Kennet Geranium and will bloom all summer either in doors or out after the first of June. They require pretty much the same treatment as Geraniums.

All plant purchasers should impress upon their minds that almost all flowering plants that are in bloom are root bound and must be frequently watered. Always make a practice of watering a plant thoroughly as soon as it is delivered by your florist. You will find that this precaution will save many plants as florists, as a rule, do not water heavily when they leave the green houses as it makes them very dirty to handle them when they are wet.

Action of Potash in Plants.

Potash has been found in the tissues of a very large number of plants tested by Weevers of Holland. In all cases tested, the potassium was present in a form soluble in water. Another curious fact revealed for the first time by Weevers, is that the potassium exists in the small air chamber or globular space in the interior of each of the plant's organic cells. instead of being amalgamated into the cell nucleus itself. The potassium is most abundant in the growing tips of rapadly growing plants, or in the outer layers of wood and bark. Chlorophl, the green coloring matter of plants, contains no potassium.

Weever concludes that potassium has little to do with enabling plants to assimilate carbon from the air, but probably is concerned more in building protoplasm at growing points. It is believed that in the leaf processes, potassium functions by combining with protein.

The immediate practical lesson taught by these new discoveries, is that rapidly growing crops require an ample supply of potassium in a form available to the plants, that is, soluble in water, but that slower growing plants do not require such a high degree of solubility.

The Breeding and Feeding of Dairy Cattle.

(Continued from page 649)

Clover hay is not grown to the extent it should be on the Island. Profitable dairying demands clover hay to supply cheap protein for the production of milk. The less clover hay a dairyman has the more concentrates he will have to buy, thereby, cutting down his profits. Timothy hay is very little better than straw for dairy cattle. Oats are the great crop on the Island and they supply lots of protein and make a splendid milk production feed.

Bran can now be fed only in small quantities on account of being so high in price. Oil-cake is more profitable buying and cottonseed is still more profitable but the latter must not be fed in too large quantities. These meals may be fed in the following proportions, and give good results. Six parts crushed oats, one part each of bran, oil-cake and cottonseed. Individual cows will eat different amounts of this meal ration; no hard and fast rule can be laid down. The feeder must use his own judgement. In regard to summer feeding, while the grass is good nothing need be added, but preparations must be made for Autumn and late fall feeding by sowing patches of peas, oats, and vetches, which can be fed night and morning in the stable, not thrown to them in the field. Fodder corn may also be grown for late fall feeding.

Dairy cows must have all the water they need in summer and winter. I do not think it advisable to install inside watering systems; they are a great advantage for a few stormy days in the winter, but a sure result of this method of watering is that of keeping the cows too much in the stable, weakening the constitution of the herd and its progeny. We must have healthy cows as well as a large production of milk. A sheltered yard and a watering trough is the best method of watering stock. Insuring enough exercise and no needless exposure. To sum up, dairymen must breed for production, by using bulls of heavy milking strains, and give their heifers every chance to develop, and feed their dairy cows all they will profitably consume in order to make profits that will warrant them continuing in this important industryf—W. R. Clark, P. E. Island.

To Calcalate Power Needed.

Six horsepower will drive a grain separator and thresh 2,500 bushels of oats in 10 hours.

Three horsepower furnishes all power needed to make 5,000 pounds of milk into cheese in one day.

Six horsepower will run a feed mill grinding 20 bushels of corn an hour.

Five horsepower grinds 25 to 40 bushels of feed, or 10 to 20 bushels of ear corn an hour.

Seven horsepower drives an 18-inch separator, burr mill and corn cob crusher and corn sheller, grinding from 12 to 15 bushels of good fine meal.

Six horsepower runs a heavy apple grater, grinding and pressing 200 to 250 bushels of apples an hour.

Five horsepower will drive a 30-inch circular saw, sawing from 50 to 75 cords of stove wood from hard oak in 10 hours.

Six horsepower saws all the wood four men can pile in cords.

Twelve horsepower will drive a 50-inch circular saw, sawing 4,000 feet of oak or 5,000 feet of poplar in a day.

Ten horsepower will run a 16-inch cutter and blower, and elevate the ensilage into a silo 30 feet high at the rate of seven tons an hour.

One horsepower will pump water from a well of ordinary depth in sufficient quantity to supply an ordinary farm-house and all the buildings with water for all the ordinary uses.

Always Sign Your Letters

We have three letters, containing cash or its equivalent that were forwarded without, signature to this office. See notice in our one cent per word cnlumn. If you have forwarded us any money and the label on your paper does not show that you have been credited with the amount enclosed notify us, if the description in the ad referred to conforms with that of a letter you may have sent. We would like to get this signatureless tangle unravelled.

Spring Foals.

The advantages of the spring foals are that this is a natural breeding season, the foals are usually stronger, they can spend a greater proportion of their early life outdoors and will be less trouble than the fall colts. In any case, colts should not be allowed to run with the mares when at work. In the fall they may be left in box-stalls. If spring colts, they should be left in the yard or paddock, preferably a grass plot, and allowed to be with the mares only when the latter are brought in for feeding during the day. This will be no hardship to the colt, there will be less risk of its being injured, and more work will be gotten out of the mare, because she will not fret, and the colt will not be in the way on the fields.

P. E. I. Crop Conditions.

The weather during the last month has been exceptionally favorable for the growth of crops. Rainfalls were fequent, and the weather moderately warm, with the exception of two days, which were very warm. There is now more water in the wells than on May 10th. Pastures and old Meadows look much better than usual at this time of year. About 12 per cent. of the new meadows are a complete failure and many of them have been ploughed up and seeded with oats and peas. Where the seed survived the drought of last summer there will be heavy clover. Even with the continuence of favorable conditions, the hay crop is not likely to be up to the average. Seeding was completed about June 5th., except in the lower lying parts of Western Prince County. Potato planting is now general and the average will likely be larger than usual. The bloom on fruit trees of all kinds is very abundant. The crop of lambs is better this spring than usual. Young pigs, which were plentiful the last of April are now reported as being very scarce.

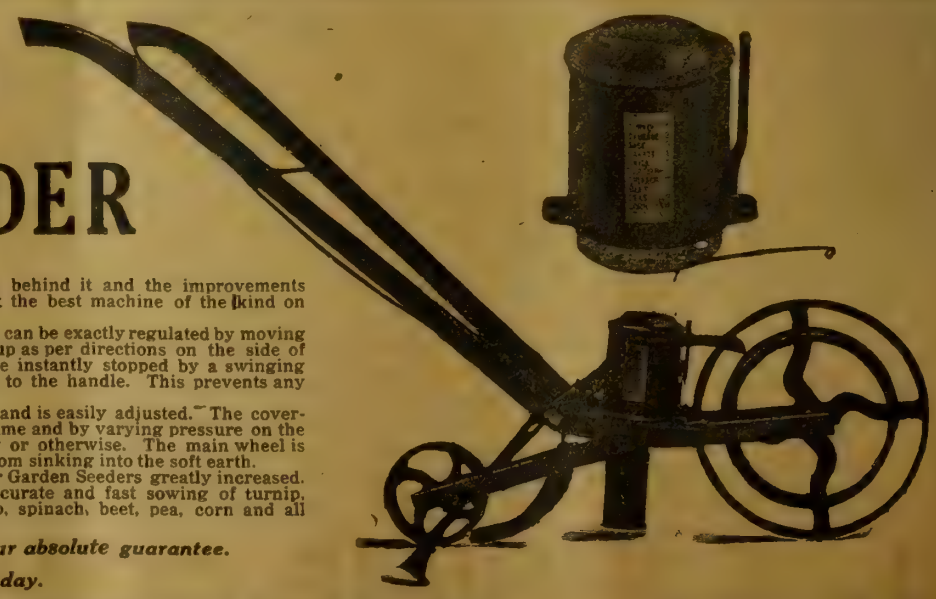
The following are the market prices for June 10th., 1912.

White oats, $1.78 per hundred lbs;
Black oats, $1.85 per hundred lbs;
Potatoes .85 per one hundred lbs.
Hay .75 per one hundred lbs.
Straw, .32 per one hundred lbs.
Pork, $10.50 per one hundred lbs.
Beef Cattle, $6.75 per one hundred lbs.
Butter, $26.00 per one hundred lbs.
Eggs, .20 per dozen
Pigs (5 weeks old) $6.00 per pair—June Circular.

Summer Grain Shipments.

A shipment of 50,000 bushels of grain has arrived in St. John and is in the Intercolonial Railway elevator awaiting shipment this week by steamer to London. It is expected that each steamer of the Furnace Line during the summer will carry about the same quantity.

GARDEN SEEDER



Our Seeder has years of success behind it and the improvements recently added, makes it without doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. The flow of seed can be instantly stopped by a swinging cut-off operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our Garden Seeders greatly increased. No better seeder can be built for accurate and fast sowing of turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seed.

Every machine carries our absolute guarantee.

Send us your orders today.

The Sussex Manufacturing Co. Limited, Sussex, N. B.

British Investors Interested

The touring party of British financiers and manufacturers under the guidance of Mr. W. Leonard Palmer of the London Financial Post, took very careful note of the development and prospects of St. John and in the province of New Brunswick generally. It was not with them a mere holiday trip. They made careful inquiries concerning real estate, trade conditions and the outlook for manufacturing enterprises. While in St. John several of them purchased a number of lots of real estate, and others enquired as to the suitability of St. John as a location for branch factories. They stated frankly that they were looking for business openings during their tour of Canada, and wanted to be shown what each locality had to offer. They were much impressed with the natural gas in Albert County, and saw the gas in use in Moncton factories. They saw the St. John River valley and other parts of the province, and were most favorably impressed with its natural resources.

Englishman Buys Farm.

The farm lands of New Brunswick are attaacting a good deal of attention in the old country and a company has been formed in London to purchase a large farm in the province where the sons of well-to-do people may be trained in the agricultural methods best suited to the province before taking up farms for themselves. W. G. Pine-Coffin, who has large estates in England, lately visited New Brunswick, and before leaving on his return to the old country purchased seven farms in Kings, Queens and Carleton Counties, aggregating 1061 acres. One of these farms, containing 210 acres, he purchased for his own brother, by whom it will be occupied. This is the largest sale of farms to a single outside purchaser that has been put through in the Province for many years.

Back to New Brunswick.

Elaborate preparations are being made for the comfort and pleasure of visitors to St. John and other parts of the Province in the back to New Brunswick week, July 9th. to 14th. As the date approaches more and more assurances are received that thousands of former residents of the province will take the back trail the first week in July. There will be special celebrations in a number of the towns on certain days, and everywhere the glad hand will be extended to the homecomers, who will find greater activity and progress than their native province has ever before known.

Cleanliness in the Dairy.

Cleanliness is a most important consideration in the dairy, and dairy machinery that is easy to clean commends itself to the thoughtful farmer. Thousands of our readers who are turning Sharples tubular separators twice every day appreciate the fact that the few parts these separators have to clean, and the ease with which they are washed, reduces the tiresome drudgery and saves the wife both time and labor. The Tubular is easy to clean. Look into this matter before you buy a separator. Compare it with other makes, both as to skimming qualities and ease of operation, and be guided accordingly. You can do this without the cost of more than one cent. Send a post card today to The Sharples Separator Co., West Chestur, Pa., and ask for free Catalog 194, or is there is a Sharples agent in your neighborhood, ask him to let you try it yourself. "The proof of the puddling is in the eating." In sending for this information we ask our subscribers to be kind enough to mention this paper.

The Bean-Weevil.

The one pest that hampers the bean growing business is the bean-weevil. It is smaller than the pea weevil, which in other respects it closely resembles. The eggs of the female are deposited on the green pods of the bean and hatch in a few days. The larvae worry their way through the pods into the seeds on whose interior substance they feed. With the growth of the pods and the seeds, the holes made by their entrance are closed, and when the crop is ripe there is no indication of their presence. Many of the larvae pass through their various transformations before cold weather, but the greater number continue to feed through the winter, and do not become perfect or full grown beetles till the next spring. On the approach of warm weather these beetles leave their cells, and like those which completed their transformations the preceding autumn, seek sheltered places in gardens and fields, or, in other words, get ready for another crop of beans and more devastation. The best time to fight the bean weevil is after harvest and during winter. As there is no remedy for injury already inflicted by these pests, the fight against them must be taken up along preventive lines. Planting late in the season, or during the latter part of June, and even as late as July 10th. or 15th., is practiced with good results in some localities, as the released beetles perish for substance before the new crop comes in. But this cannot be practised everywhere, as planting at so late a date would not allow sufficient time for the crop to mature. Heating the beans, as soon as they are dry, to a temperature of 145 degrees will kill the larvae they contain, and if carefully done will not produce premature germination. A more desirable, as well as a more efficient method is to dry the seed thoroughly as soon as harvested, place in air-tight barrels, and turn into each barrel, just before heading, a gill of bisulphide of carbon, spirits of turpentine, or chloroform. But care must be taken in using these materials that they are not opened or handled near a fire or lighted lamp, as they are explosives. After pouring in the liquid close the head of the barrel tight, and the all-winter fumigation will do its work. In the spring the beans should be examined, and if the weevils are still found alive in them, pour in another gill and give an additional fumigation of a month or two. Of course, killing bean-weevils is just like exterminating orchard or any other pests with which the farmer has to contend—individual effort counts but little. The work of one careful grower may be "back-capped" by the neglect of his careless neighbors.

"THE following letter from Mr. Gilbert Graham is proof conclusive of the high quality of MOLASSINE MEAL for feeding Horses.

Messrs L. C. Prime Co., Ltd.,
St. John, N. B.

Sirs:---I have been feeding Molassine Meal to my Horses for some time with excellent results, particularly to a two-year-old Colt.

A short time after starting to feed this Meal, the old hair came out of the Animal and her coat became slick and glossy. She now weighs 1100 pounds.

I know of no Feed to equal MOLASSINE MEAL for bringing and keeping Animals in the pink of condition.

Yours truly,

Gilbert Graham

Magundy, York Co., N. B.

The sales of MOLASSINE MEAL have been far beyond our expectations and the demand from Ontario and Quebec has been so very heavy that we have opened offices in both Montreal and Toronto. We are also shipping large quantities to Manitoba and many parts of Western Canada.

Middlings and Oats are grown in Manitoba and are much cheaper than here. MOLASSINE MEAL is much higher in Western Canada than in the Maritime Provinces on account of the high rates of freight from here to Western Canada. No further arguments are necessary. If you are not using it today, you will be using it tomorrow or next day for feeding your HORSES, CATTLE, SHEEP, PIGS and POULTRY."
